A
GUIDE
TO THE
PRACTICAL PHYSICIAN:

SHEWING,

From the most Approved Authors, both Ancient and Modern,
The truest and safest way of Curing all DISEASES,

INTERNAL and EXTERNAL,
Whether by *Medicine, Surgery, or Diet.*

Lately Published in Latin by *Theoph. Bonet*, M. D.

And now Rendred into English, with the Subtraction of some things of less moment, a more exact Relation of several others, and an Addition of many considerable Cases, Rules and Means of Cure, that were omitted by the aforesaid Author.

A Work very Necessary and Useful for all Practitioners in Physick.

To which is added,

An APPENDIX
CONCERNING
The Office of a Physician,

By the same AUTHOR.

LONDON,

Printed for *Thomas Fleisher* Bookseller, at the *Angel and Crown*
in *St. Paul's Church-yard*, MDCLXXXIV.

24297

TO THE MOST
ILLUSTRIOUS and NOBLE LORD,
EDWARD Lord HIDE,
VICOUNT CORNBURY, &c.

I Present to Your Lordship a Mercury, not Him indeed who sends Souls to the Infernal Shades, or is a Guide of the way that leads thither; but one who, as the Poet speaks, *Animas Orco Evocat*, conducts them back again from thence: Or, more truly, a Guardian of humane Health, and a stout and trusty Vanquisher of the Diseases which commonly oppress Mankind. Nor is this a thing that is new to Your Lordship, as being not onely initiated, but very well instructed in the Wisdom of the Ancients: You are not ignorant that the Egyptians, that is, the Guides of the Greeks, and the first Mystagogues of all the Learning and Religion of the Ancients, have deliver'd to us all their Inventions, and the bright Lights of all Arts and Sciences wherewith that Nation shone heretofore, under the Name of Mercury: But why do I recount those ancient and (I had almost said) anile things? Permit me (with the favour of my good Genius) under the Statue of this Mercury to offer unto Your Lordship, not my Eloquence, such as became either the Egyptian or the Grecian Hermes, but a Devout Mind, and a Respect that is owing on so many Accounts. My hope is encouraged both by Your singular Humanity which I have been an Eye-witness of in several Instances, and also your free and generous Disposition, and (which ought not to be past by in silence) the pleasant propension of Your Mind towards our City, which you have declared abundantly, by taking up Your Abode for some Years with us. All the Citizens, (from the highest to the lowest) think themselves happy in having enjoy'd Your Presence, and they admire Your large, acute and ingenious Wit, Your piercing Judgment, (ripe before Your years) the Brisk-

a

ness

THE EPISTLE DEDICATORY.

ness of Your Memory, the quick and ready Motions of Your Mind, Your swift Knowledge of things, Your Eloquent Invention, yea, and Natures prodigality in bestowing her gifts upon You, who hath given You a comely Body, and such whose Strength exceeds Your Age, as being not yet Twenty years old: By virtue of which Strength You far exceed all others in such Horse and Foot Exercises as become a Nobleman. The most Illustrious Earl of Clarendon, Your Father, having observed in You a Genius growing up to all Sublime things, and even from Your Childhood a great Soul in a little Body, well knowing, that Instruction promotes inbred Virtue, chose for Your Tutor the most Noble and Excellent Mr. Hamilton, of an Ancient and Honourable Family, who, by his own Virtue and Learning, increasing the Glory derived from his Ancestours, hath not onely obliged all the Muses in the strictest familiarity, but hath also taken a full view of Machaon's Tents, and entred into the Sacristie of Medicin: Through his Tutorage there shine forth in You all Virtues, and a remarkable Piety, whereof the Holy Temples are Witnesses, which You are used to frequent: Your Liberality, and a Mind prone to pity are Witnesses: By Your Goodness You love to please all; You are affable to all with a Countenance composed betwixt Gravity and Courtesie. I omit now all the other Ornaments which surround You on every hand, Your Family adorn'd with the Affinity of Kings; Your Grandfather heretofore not onely the Mercury, but the Pallas of Britain, the President of both Wisdom and Eloquence, and a Faithfull Ambassadour to his Prince: Nor do I here speak of Your Father, whose Integrity of heart, incredible Humanity, singular Learning, in almost all kinds of Sciences, unwearied Study in cultivating the elegancy of Learned Antiquity, and in Collecting an excellent Library of Books, are much extolled by all such as come hither now and then from Your Fortunate Islands: The same persons greatly magnifie Your Uncle, who has been heretofore honoured with the most splendid Embassies, and whom Britain being joyfull, and presaging well of her Affairs, does respect and honour amongst the Chiefest Ministers of State: But the office of my Mercury is not to enter into these large Fields; 'Twill be Your part, my Noble Lord, henceforward to receive him, though rude of Speech, or destin'd for the promiscuous use of all, into Your Patronage and Favour. Farewell.

Genev. 4. 1d. Jan.
Ann. 1682.

Your Honour's

Most humble and obedient Servant,

Theoph. Bonet.

THE Authour's Preface TO THE READER.

It is told us by the Ancients, That formerly *Mercury's* Statue was placed in the Cross-ways, to guide Men in the right way, and to reduce them that were out: The same Fate does sometime attend both the Traveller and the Physician; for both of them

— between two parting Ways oft stand,
To which to turn, uncertain which the Hand.

Ofttimes there is occasion for a Guide in ones Journey, who may shew a Man which way he must follow: This is often right-forward, and yet it leads out of the Way: for there is such a weakness in Humane Understanding, that it is blind in things as plain as the Nose on a Man's Face, much more may it stumble in the dark. "In practising of Physick, says *Galen*, Men must take care that they doe nothing rashly; for, besides that negligence herein creates no small danger, it brings a Man into great disgrace. For, as he says, *Comment. 1. Aph. 1.* Bricks, Loam, Wood, Stones, Tiles and Hides, are not the subject matter of the Art of Physick, as they are of Trades, in which Men may try any thing without offence to any Man, and may make Experiments for Invention, and Confirmation of Theorems, as Carpenters do in Wood, and Curriers in Leather: For if a piece of Wood or Leather be spoiled in Working, no Man is endangered by it. But to try Experiments in Humane Bodies, which have not been approved by Experience, wants not danger, since the Issue of rash Experimenting is the destruction of the Man. Therefore *Hippocrates 2. Prorrh.* bids the Physician observe a Man's Mind, his custom, and the strength of his Body. Besides, *Similitudes in Diseases* do often impose on good Physicians, and create Errours and Difficulties, according to *Hippocrates, lib. 6. Epidem. 8.* that is, Artificial Conjectures, whereon we rely much in the Cure of Diseases, and in the knowledge of the whole Art, do often fail: And, as *Galen* says, "Oftentimes Reason imagines many things with it self, which Experience afterwards refutes. Therefore a small Errour, says *Averroes*, occasions infinite mistakes. The *Methodus Medendi*, or Method of Curing, derives its Name from a Way, which, by Indications, shews which way we must take, and gives us the advantage of avoiding all Errour. *Hieronymus Capivaccius* formerly set so much by this, that in his opinion, a Physician needed nothing else in practising of Physick: They say, that a *Polander*, who had taken his Degree at *Padua*, being to return to his own Country, requested him to reveal some of his secret Medicines to him; and that he gave him this Answer, *Reade my Method, and you will have my Secrets*: But how strict an Observer *Capivaccius* was of his own Method, his *Praxis Medica*, and other of his Works do shew; where he takes notice of many Errours, made manifest to him by practice and experience, not revealed by Reason. *Galen* himself, who first shewed the Way, and was the first contriver of the *Methodus Medendi*, forbids a Man to rest in Universals, but

The AUTHOR'S PREFACE

but to descend to Particulars. "For who can hope to search out the manifold variety of "Precepts, without constant Practice? says *Hippocrates*, *l. de Præception*. Who therefore thinks the Art is long, because the Indications must be taken onely from the Specifick Disease. "To think, says *Galen*, *3. meth. med. c. 3.* that there is any one general "Cure for all Men, as some stupid Methodists do think, is a piece of the greatest madness in the World. A Physician's business lies in Particulars, and by particular Experiences a solid knowledge of the Art is acquired. *Seneca* says, "The way to a Science or "Art by Precepts is long, by Examples, short and effectual.

It is easie indeed to know, what *Rheubarb* is, what *Burning*, what *Cutting*; but in Practice, how they may be accommodated to Use, when *Purging*, when *Burning*, when *Cutting* is convenient, is not so obvious; nor can it so easily be understood, For What, When and How they must be used, because of the variety of Circumstances, and the divers changes which Mens Bodies incur. "To know what must be done is no great matter, but by what means you may doe it, to know this is all the Skill, says *Galen*, *lib. 6. Method. med. cap. 2.*

Yea, and several Mens Idiosyncrasie is various; it has something hidden, which is manifest to no Senses, can be found out by no tokens. This Difficulty so tormented *Galen*, that it extorted this Expression from him; *If I were but able to discern every Man's Idiosyncrasie, I should think my self as good a Physician, as I imagine Æsculapius, or Apollo to have been.* Truly he that intends to practise Physick, supported onely by Method, is like him, that would try to travel the whole World over, by the guidance of one Geographical Map; or him, that would sail to the *Indies* onely by the Compass, without any other Sea-Chart. Many impassable places occur, Woods, Mountains, *Scylla* and *Charybdis*, which stop the course, and indanger Men. Nor will a Man, destitute of a Guide, make any farther progress on his way, than if he went on one Leg: A Man has occasion of both, who will proceed as he should; of Reason, which in Method, as in a Map, shews the Indications, and what ends we must aim at. There must be a previous knowledge of this, by the direction whereof, they that run through the broad field of Physick, administer all things, dispose them, reduce the wandering mind into the Path, out of an inextricable and confused multitude of things, and lay open the hidden way of doing things: If this be wanting, all Physick is uncertain, wavering and doubtfull: Without this, Medicines are like a Sword in a Mad-Man's hand, which would otherwise prove to be the hand of GOD, if they were dextrously used, as *Hierophilus* said of old: This shews whether a Disease should be opposed, or no; If any thing must be done, What, How much, When, Where, and in What manner: This teaches to vary the Cure, according to the nature of the Disease, variety of Causes, urgency of invading Symptoms, and the diversity of the afflicted parts; yea, it teaches how to cure one and the same Disease in divers Individuals, and grieved parts, several ways. But however it is, that Reason dictates these and the like things; yet Experience must be called in to its assistance, being in order of Nature first, for Reason was found after Physick, not Physick after Reason, which owes its Being to Experience. The dignity of Reason is great, yet it is lame, unless there be the other Leg, Experience, supported by the Senses, under which what things do fall, are not subject to Mistake, but they put all things out of doubt. Yet Reason is necessary in these things, which the Senses cannot reach. "For of such things, as are contrary in Quality, there is Method; but of such things as are contrary in their whole Substance there is no Method, but they were all found out by Experience, says *Galen*, *lib. ad Thrasib.* But if Reason confirm things, that are found by Experience, they are of undoubted truth. And if these two contradict one the other, we must rather adhere to Experience; but not to every Experience neither: For there is a difference between *πειρα* and *ἐμπειρία*, between Experience and Empiricism. For what is more common with some Physicians, than, before they scarce understand any thing, to appeal to their own Experience, and to cite it for good Authority? This often holds good in two or three things, and fails in others; for Experience does not depend upon this one or the other case, but upon the repeated act of many Examples. He that relies upon any one or the other Example, may be called an Empirick, or an Experimentator, if he practise Physick upon Experiments, not true Experience. "Experience is not to be trusted, says *Galen*, *3 Aph. 10.* Because, though we see the same thing often, we cannot say it will be always so. Nor ought a Man to make Physical Aphorisms of things that he has seen but once or twice. Certain Experience must not be expected, unless from a Learned, Skillfull, exactly Judicious Physician, and one who has often travelled the Way of Physick.

to the READER.

Tears Men expert make.

"Experience, according to *Galen*, *libro de optima Secta*, is the comprehension and memory of that, which is seen frequently, and in the same manner. "Nor can Physicians, says *Cicero*, *1. de Offic.* though they do understand the rules of Art, atchieve any thing praise-worthy, without Practice and Experience. And to this, Prudence is highly requisite (the Companion usually of Old Age, says the same *de Senect.* as Rashness is of Youth) which, according to *Aristotle*, *1. ad Nicomachum* 8. not onely considers that which is absolutely and universally Good, but also that which is good for this or that particular person. For a Physician's Consideration, is not onely of τὸν κατὰ τὸν, but τὸν κατὰ τὸν, not onely of Generals, but of Particulars.

For we should always remember this of *Seneca*; "What uses to be done, What ought to be done, may in general be given in charge and written: Such Advice may be given not onely to people absent, but to Posterity. This other, When a thing should be done, or in What manner, no Man can advise at a distance; deliberation must be taken with the things themselves.

But how can that Art well proceed by the conduct of Reason alone, which by the Ancients was reckoned among Conjectural ones, that is, among such as do not always, and every where obtain their end, how expert soever the Artists are, and practice never so exactly according to Rule? "It has not, says *Hippocrates*, *lib. de Arte*. as other Arts have, things that are tractable, for its Matter: A Physicians subject is Man's Body, not altogether so obedient, but rebellious and intractable. Many things happen, which render the event of the Art uncertain and dubious, and therefore make the Art it self Conjectural. So according to *Celsus*, *l. 2. de re Medica*. "In Physick, what ought to be done is not perpetual, yet something, which it is convenient to follow, is perpetual. When a Physician is thus in the Mire, *Hippocrates*, *lib. de Præcept.* that Physician will not behave himself unbecomingly, who, when his Patient's case seems dangerous, and he is blinded chiefly by unskillfulness, calls other Physicians, that by friendly conference the Patient's case may be stated aright, and they may together give their assistance to the cure: For in the Violence and Constancy of affliction, when the Disease increases, through want of Advice, the Opportunity of many things, fit for the present occasion, is slip. In truth, the Consultations of Physicians are not uselefs and supervacaneous, seeing in all Plenty there is Want, says *Hippocrates*: For how erudite and experienced soever the Physician is, besides, though he have a Wood of Medicines; yet he is but a Man, he may be deceived, err, slip and stumble sometimes on the plainest ground, because of the incomprehensible variety of Particulars, about which he is conversant. And we say commonly, *In a Physician's Work two Eyes see better than one*, as *Zwingerus* expresses himself, *comment. in lib. cit.* Because, even the Variety of things requires some Animadversions, it is good for every one to know, what he must most avoid and when, as *Celsus* says very well.

Now either a Man's Fellows are taken into Consultation, or such as have committed to Writing what in their Practice of Physick they have observed to be singular about their particular Patients, and do offer to us the Knowledge of those Means, whereby this or the other Man has obtained his health; and this not in a single Disease always, but in complicate, contrary or opposite Diseases, by which very thing General Rules are put in Use in a particular Subject. Among them who have been eminently laborious in this Service *Ludovicus Septalius* of *Millain* is chief, he published his *Cautiones & Animadversiones Medicæ*, wherein, as he himself says, the Manners, as it were, and the daily Discipline of the Art are contained: A Piece of that Excellency, that *Johannes Rhodius*, in *Cista Medicâ Thomæ Bartholini*, advises every one, when he begins to practise Physick, not onely to reade it over and over, but by degrees to enlarge it with other Mens and his own Observations. I, being moved with this Advice, did ten years ago publish some Medical Cautions and Animadversions, taken out of *Gulielmus Ballonius* his Works, digested in the same order as those of *Septalius*, by the Title of *Pharus Medicorum*, quite omitted in this present Work, because another Edition, larger by a third part, and of a better Print, is ready every moment for the Press. I left out *Septalius* also himself, and the worthy *Rhodius*, who, to fill up the Vacuities in *Septalius*, published his Collections and Notes, taken out of the Treasury of several Physicians. He is sparing of his Words, rich in Sense and Matter, comprehending Cases in short Periods, and onely touching the Heads of them; which Cases, I thought it the best way, to describe at large, as they occur in Authours, leaving him in a manner

The AUTHOR'S PREFACE, &c.

a manner untouched; that, I might not seem willing to rob them of a Book of immense use, who love short Treatises. What things I had gathered in my reading of abundance of Authours, I gave them the form of an *Index*, and digested them in an alphabetical order, after the example of those famous Men, *Job. Andr. Schmitzius in suo Medicinæ Practicæ compendio*, and *Dr. Thomas Burnet in his Thesaurus Medicus Practicus*, not according to the usual placing of Diseases according to the parts of Man's Body, to the end the Physician may the sooner find what he looks for. The Work recommends it self for its usefulness and novelty: For the Inventions of modern Anatomists have given a great deal of Light to the *Methodus Medendi*, and have made it far plainer, out of whose Treasury I have brought a great many things hither. Certainly no small Light has been given to it, since the Circulation of the Blood has been discovered, since the Thoracick Ducts, Lymphatick Vessels, Salival Glands, &c. have been found. Add to these the Industry of Chymists, which has furnished us with far more safe, wholesome and gratefull Medicines. "Chymistry, the most liberal Dispenser of practical Felicity, does adorn, bless and ennoble Mankind with many Benefits, says *Rolsinccius, Dissertat. Chymicorum prima*. I have compiled this Work out of many, ascribing to every one his own. The Observations, that have no Authour's Name affixt to them, crept hither out of my own Diary. Some perhaps may blame me, that I have made this up onely in a manner of borrowed things. But if many Authours be perused, it will appear, that they plowed with another Man's Heifer. Some blame *Mercatus* his voluminous Works, as made up of several; For he, as *Julius Guastavinus, lib. 2. locor. in Med. select.* observes, transcribed many things out of *Jacotius, Fernelius, Salius*, with very few Alterations, and all out of *Brudus Lusitanus*. *Lazarus Riverius* compiled his Practice out of *Sennertus, Thomas à Veiga, Salius, Varandæus, Zecchius, Job. Hartmannus, Enchiridion Medicum Practicum*, and others.

Some have given their helping hand to the like Work, by shewing the Mistakes of Physicians, as *Cardan, Sanctorius, Lazarus à Soto, Mercatus*, out of whom *Augerius Ferrerius* took a Volume of *Castigationes Medicæ*, assuming them to himself, I reckoned it a piece of Justice to render to every Man his own, nor indeed could the Design well otherwise be finished. *Maximus in Cedrenus* gives his judgment concerning Writers of Books. *Books*, says he, are commonly written to these ends, either for a Man's own Memory, or for others Good, or for both: Sometimes also to hurt others, either to shew ones Wit, or because Necessity so requires. Certainly they deserve Commendation, who study their own and other Mens Benefit, and the publick Good; as they often pay for their Rashness, who, gaping after Glory, expose themselves to the uncertain Lottery of other Mens judgments. But they deserve best from Learning, who keep nothing from others which they have learned by Experience, but make it publick; and who being informed by long Practice, both what ought to be done, and what avoided, do either here and there insert it in their Works, or put it out in particular Tracts. None of us is good at all things, this Man is good at Explication, that Man at Correction, another at Consultation. Let every Man contribute what he is able, and give his Assistance by his Purse, Pains or Advice. I have cast in my Mite, in which I have bestowed nothing on Pomp, all on Use; for which if you shall esteem this fit, it shall never repent me of my Pains. Farewell.

THE Translatour's Preface TO THE READER.

THOUGH the Authour himself has already address'd you; yet his Modesty not allowing him to give this Book of his the due Character of so learned and usefull a Work, because his own; Justice bids me say something farther on that behalf. I have seen a little in the Practice of Physick, and I highly value Bonetus his Judgment both in making Choice of such a Design, and in the Prosecution of it, for the Advancement of Practicall Knowledge. His Design is, to take out of all Classick Authours in the Art of Physick, from Hippocrates, the Father of the Faculty, (who lived some hundreds of years before the Physician of Souls was incarnate,) down to his Contemporaries and Himself, in the year of the Incarnation 1682. all that does directly tend to the saving of sick Mens lives. So that in this one Volume you have the Substance (I may safely say it) of the Medical Library, which has been about two Thousand years in collecting: For there is not one Authour of Note, who hath left ought to Posterity in all that time; but here Bonetus presents you with what is material for Practice out of him. So that, besides the vast Charge which a Man would be put to in furnishing himself with so huge a Library as he must of necessity have to compile so great a Work; and with the Charge, besides the great difficulty to procure some Books for any Money, (for several, that he quotes, I know to be both dear and scarce; and he often cites Passages out of a Manuscript of Sir Theodore de Mayerne's, our English Esculapius of his time, which never yet has been printed;) I say, besides the Charge and Difficulty in getting Books, he saves that Physician, who has them, a great deal of time in perusing them, to find what is pertinent to the Case he would be resolv'd in. For if you understand Latine, you may find the Name of your Disease Alphabetically in that Tongue, and there is your Case, without any farther trouble: Whereas, should you have recourse to the Authours themselves, it might take you up some Hours time, to meet with what you may here find, in fewer parts of a Minute. So much for his Design.

But in all this Variety, (he so prosecutes his Design) there is no Confusion. At first view, indeed, one might look upon it as a Medley: But any one who understands what Method is, may see, that if each particular Case, or at least every one of a great number of them, were but converted into an Universal Axiome, all the general Rules of the Method of Physick might be had in their order: For so, if you consult the Contents of each Title, you will find them. And when each Case will afford an Aphorism, and all those Aphorisms make a completer Body of Physick than has ever yet been written, I think I cannot sufficiently admire the Management of his Design.

And after the Authour has done them well, what can I say for my self in the name of those that assisted in the Translation, but that we hope we have given you the Authour's Meaning in plain English? But farther, we must advertise you, that we have omitted several of Zacutus Lusitanus his Cases, because, being miraculous, our Faith could not reach them, unless the
Authour's

THE TRANSLATOR'S PREFACE, &c.

Author's Credit had been less suspected: We have omitted some others, which we apprehended to be but of small moment; especially such as had the Reason of them founded on obsolete Hypotheses. And, because the Author had been long in collecting this Treasury, he transcribed the Passages from Authours (as he met with them in the perusal, or in his own Practice) under their proper Titles, without any Method in them, and so they were printed, onely the Contents were methodical: But in the Translation we have put the Cases into Method, according to the Contents. And, in lieu of those Passages that were omitted, we have put many new ones in, as, particularly, much out of Septalius, whom Bonetus so highly commends, but left him and some others of the same nature out of his Work, because (as he tells you in his own Preface) he would not spoil the Sale of so good Books. And since this Learned Age is daily productive of Excellent Books, we have added much out of some that came out between the Publication of the Latin and this Translation, as, We have given you an Epitome of Ten Rhine of the Moxa, which shews the Cure of the Gout, and of most Diseases in the East Indies by Burning with Moxa, and the way how we in England may make it; therein also we give you Sir William Temple's Experience of it in the Low Countries, when he resided there in a Publick Capacity from His MAJESTY of Great Britain. We give you also much of Dr. Sydenham's Tracts, that came out since the publishing of Bonetus. Besides, we have added much out of Willis of the Scurvy, much out of Glisson and his Partners, and Whistler of the Rickets, none of which, except Willis, were ever in English; and many Passages out of other Authours, most Latine, some English.

But, besides all these things, We have given you all the best Receipts and Medicines, which were most relied on in Practice by the most Physicians in all Ages to this time, for particular Diseases. These we translated out of Waltherus his Sylva Medica, which came out two or three years before Bonetus, a Work of vast Pains and Charge, collected out of some Hundreds of Authours, wherein he gives us an account of most Authours that have written on any Disease, and withall he sets down what Medicines those Authours in their Practice principally relied on. So that generally, with the Causes, you have means wherewithall to answer them, and perform the Cures: Besides that, in the nineteenth Book, you have the Reasons of the Operations of Medicines.

Now if both Bonetus and Waltherus be so highly valued among the Learned (who understand the Languages of those Authours, out of whose Works these two Excellent Persons compiled theirs) that, though so lately published, they are already become scarce; What Esteem Bonetus and Waltherus in English should bear, among English Readers, that would understand Physick, I leave to any Man to judge. For not one hundredth part of the Authours, which Bonetus and Waltherus quoted, ever were, or are ever like to be, in the English Tongue: So that for this very Reason, the Translation may deserve a higher Esteem among mere English, than the Original among the Learned; since these can understand the Principal Authours, without an Interpreter; the other cannot, and so for want of one, were it not for this Book, might live in Ignorance of many Excellent things.

The Author, Bonetus, is an ancient Dr. of Physick in Geneva, a Man of great and successful Practice, and of infinite Learning, as other of his Works, but this especially, do shew. He dedicated this to a Noble Personage of this Land, as you may see before; And how can we more gratefully acknowledge his kindness, than by letting our Countrey-men understand, how generous it is to all Men in his publishing so usefull a Work in Latine, and in particular to our Countrey-men in his dedicating it to a Noble Earl of our Nation?

Now because the Alphabetical Disposition of the Diseases, according to the Latin Tongue, will not be serviceable to the English Reader, we have made an English Index, whereby you may find the Disease which you want in the Book; and then, run but over the Contents, and you will meet with your Case.

And, after all, I appeal to the Learned, Whether these two Books (both of which are valued by such) when they are made One, be not a Book of the greatest use in Physick, that has ever been published in any Tongue, and much more in English. Farewell.

A GUIDE

A GUIDE TO The Practical Physician.

BOOK I.

Of Diseases beginning with the Letter A.

Abortus, or Miscarriage.

The Contents.

- It ought not to be procured for the remedying of any diseases the woman with child is troubled withall. I.*
How a simple voiding of blood may be distinguish'd from it. II.
The distinction of its causes according to the times that the woman is gone with child. III.
The symptoms that use to accompany it, require the providence of the Physician. IV.
How the concomitant Symptoms may be cured. V.
A prevention of it by frequent blood-letting. VI, VII.
Plasters apply'd are not to be kept on long. VIII.
When there is occasion for Adstringents, and when for Looseners. IX.
An instant Abortion is not always to be hasten'd, from the example of one that was prevented. X.
When it is imminent, medicines that are hot must be mix'd with Adstringents. XI.
Sometimes Adstringents are onely to be applied to the Loins. XII.
Remedies applied below are safer than those taken in at the mouth. XIII.
Wine to be abstain'd from. XIV.
Medicines.

I. **D**AILY Observation shews, that Women with child are subject to many and great distempers, both Chronical and Acute, which are made more dangerous, and are harder to cure, from their being in that condition, especially Acute diseases, as Fevers, Pleurisies, &c. Hippocrates says, that it is deadly for a woman with child to be seiz'd upon by any acute disease. And according to Galen there is a double danger; one from the Fever's killing the Child; another from the thin diet that is requisite for acute Diseases, but is injurious to Women with Child; as also from the necessity of the greater remedies, such as bleeding and purging. But some

rash men, if they see their Patient in great danger, advise the procuring of Abortion. Now Abortion is more painfull and dangerous than a natural birth, from the violent divulsion of the unripe Fetus, whence very many die, some escape, but not without grievous symptoms: And the danger is the greater, if the Fetus be pretty big, (as if the Woman be gone seven or eight months) or if the Woman herself be feeble and weak, or if the labour under dangerous acute Distempers. Even healthfull Women never miscarry without danger: some retain the Fetus so pertinaciously, that no medicines will make them miscarry. Wherefore their advice is pernicious that counsel the procuring of Abortion in acute Diseases, 1. Because in many it is not easily done; 2. It cannot be done but by dangerous Remedies, and those often repeated, which aggravate and heighten acute Diseases; 3. Nor is it safe, seeing Abortion itself is a dangerous and deadly affection, as experience shews: for by the aphorism above cited, it is deadly to a Woman with Child to be taken with an acute Disease, from the Fever, the thin diet, and the danger of Abortion: now 'tis bad to add affliction to the afflicted: the Mother often perishes by destroying the Fetus with such Remedies. 4. Even a natural Birth seldom gives any relief to several Diseases; much less will Abortion cure any Disease, especially such as is acute, no, it will rather make it worse, unless the Fetus be already dead, for then indeed 'tis necessary to exclude it. Yet we must not abstain from necessary helps, as bleeding and purging, which often prevent Miscarriage; and if it sometimes follow upon the use of them, 'tis not to be imputed to the Remedies being duly administered, but to the sharpness of the Distemper that is too hard for all Remedies, or to the weakness of the Mother, or lastly to the death or debility of the Fetus. Hippocrates in his oath promises, that he will give no Woman any Medicine to procure Abortion: 'Tis the part of a Physician not to destroy, but to preserve as much as he can.

B

II. Midwives.

II. Midwives ought to be very heedfull; for it sometimes happens, that a Woman with Child voids by her Womb much blood, and imprudent Midwives think that she has miscarried, which yet is not so, but onely a Miscarriage is imminent; which whilst it is, it ought to be prevented by Adstringents; but if it be actually made, then we must help by Looseners. Wherefore Midwives ought to examine diligently the matter that comes forth, whether it be blood, or flesh, or geniture, or the *Fetus*: for by washing what comes forth in water one may easily discern whether there have been truly an Abortion or not.

Capivacc.
Præf. l. 4. c. 8.

III. *Serapio's* opinion is to be noted: He thinks if a Miscarriage happen in the first or second month, that it is caused by wind, or a preposterous agitation of the Mother, breaking the slender fibres; if it happen in the middle months, that slimy humours which loosen the *acetabula* (or saucers) of the Womb, are the cause of it; and lastly if it happen in the last months, that it is commonly caused either from want of nourishment, or straitness of the Womb.

IV. The Wife of N. miscarrying, she first voided the Secondines with much blood, which brought her very low and weak: the flux of blood abating, the next day she excluded the *Fetus* that was four months old: after this she seem'd to grow better and cleans'd indifferently well: onely what came away was very stinking and cadaverous. On the seventh day she was taken with a high Fever, and voided the *placenta* (or womb-liver) which stunk extremely, and was full of black-blood; whence she recovered by degrees. The Lady N. being four months gone with Child, miscarried, excluding the *Fetus* with the membranes; whence she was thought to be clear of all. But afterwards she fell into a high Fever, with frequent horrors and swoonings: then she voided most fetid matter with clods of blood and pieces of flesh. On the seventh day she excluded the *placenta* which stunk very much; whereupon she grew to be better and recovered.

These two Histories teach that the purgations of the Womb, when they have a cadaverous smell, for the most part signifie that some portion of the Secondines is staid behind in the Womb.

River. obs.
cent. 1. obs. 61.

V. When after Miscarriage part of the *Placenta* hath remain'd in the Womb, and a continual flux of Blood for some months hath accompanied it; I have observed it successfully expelled, and the Patient restored by three ounces of the following Decoction taken twice or thrice a day. Take of the Root of Bistort two Drachms; of the leaves of Marjoram, Penniroyal each one Handfull; Boyl them in Water and White Wine of each alike as much as is sufficient. In twenty ounces of the Decoction clarified dissolve of Syrup of Mugwort two ounces, of Cinamon Water half an ounce. For by virtue of this a piece of the *Placenta* as big as ones Fist was voided, and all further Flux of Blood was stopt and cured.

119.

VI. A Woman having suffered three Miscarriages one after another at different times of her gestation (or going with Child) being now gone but two months, had great pains about her Navel and Loins, which threatned an Abortion. Two plasters being applied, one to her Loins, and another to her Navel (made of the Plaster for fractures and dislocations) she was somewhat helped for a while, but afterwards her pains returned. I being called, observing the Woman to be young and sanguine, order her to be let blood; whereupon in a few hours she was freed from her pains and fear of Miscarriage. Her blood was very ferous. For prevention I give her a drachm of Rhubarb in powder with Broth, to be repeated once a week for a month. These symptoms had happened just at the time when she us'd to have her Menstrues when she was not with Child. Again in her third month the same symptoms return'd, and were pre-

sently removed by bleeding. In like manner in the fourth, fifth, sixth, seventh and eighth months the same symptoms returning, we opened a vein each time, whereby she was forthwith freed of them. The last time she was let blood, was eight days before the beginning of the ninth month, with the same effect; and at the end of the ninth month she brought forth a live Son in good plight but a little pale.

Idem centur.
1. obs. 53.

VII. That which *Hippocrates* writes is not every way true, That a Woman with Child miscarries if she be let blood; unless perhaps he understand it of such as have but little blood, or are weakly. Many plethorick Women that used often to miscarry, have come to retain the *Fetus* even to the ninth month by breathing a Vein. If the superfluous blood be not taken from such Women, they either miscarry, the mouths of the Vessels being unlocked by the too great abundance of blood; or else the Child grows so big that the Mother cannot be safely deliver'd of it. To such, repeated blood-letting is very profitable after the second month, or rather from the fourth to the seventh. ¶ It is very necessary to examine those things that have happen'd formerly. For when one Medicine sometime yields no relief, it will be the best way to try others. When I once saw a Woman very like to miscarry that was five months gone with Child, and had five times miscarried before; considering, first, that adstringent Remedies, both internal and topical (that had been administred at other times by other Physicians) had done her no good, and secondly, that she was very full of blood, I order'd her to be let blood in the Arm, and not in the Foot, lest Abortion should have been caused; and in the ninth month she was safely brought to bed of a living and lively Son.

Pentec. 1.
obs. 10.

VIII. Concerning the Plasters that use to be apply'd, this is to be noted, that they must not lie long on at a time, but must now and then be removed: for otherwise by lying too long on the Loins they heat the Kidneys so that a Dysury or heat of Urine is caused, or Stones and Gravel are bred therein, or sometimes pissing of blood follows.

River. præf.
l. 15. c. 17.

IX. In a Miscarriage it is chiefly to be observed, whether the *Fetus* be actually expell'd, or there is onely fear that it will be. For when it is actually excluded we must, with *Avicen*, abstain from Adstringents and use Looseners, lest, which often happens, the Membranes or naughty excrements be left and staid in the Womb, whence the Woman will certainly perish. For this reason *Avicen* dislikes Adstringents, and propounds a suffumigation of bdellium, hyssop, origanum and mustard, whereby both the exclusion of the *fetus* is help'd, and the excrements are happily purged. If the child be not dead nor as yet expell'd, but an abortion is imminent, and the *fetus* retreats, then it is very convenient to use adstringents, by the help whereof it comes to pass that abortion is prevented and the child preserved.

Capivacc. l. 4.
c. 8.
Heurn. de m.
m. c. 7.

X. A woman in the thirteenth week after conception, helping to brew, and unwarily taking up a full pail, had almost miscarried, the membranes being broken and the embryo making its way forth. A Mountebank being by chance present, and casting about how to help this disaster, advised to put the *fetus* up again forthwith into its place by the hand: Laying the woman therefore with her thighs high and her head low, the midwife very nimbly with her hand thrust in the *Embryo* that was coming forth, and presently after the operation laid the mother in her bed, that the *fetus* being put up again might fix in its former seat; yet her *lochia* flow'd for three days. The same Mountebank perswaded the woman to have her husband lie with her, that the broken membrane might be generated anew. Hence the *fetus* being retain'd, was born at its full time, and is still alive.

Franc. Sylvius usprax. med. c. 53. l. 1.

I. b. **A**vicen. says, 3. 4. tract. 1. cap. 29. Defer not to open an abscess that is suppurated, for many mischiefs flow from matter kept too long in the part. But Guido in his Treatise of Imposthumes, bids us tarry till Nature attempt to burst them; for he says, that opening which is made by Nature, is better than that made by Art: for this latter uses to breed an immoderate quantity of matter, and creates foulness in ulcers.

B 2

But

But unless you understand *Guido* of Imposthumes seising upon the inward parts, his doctrine will hardly agree with that of the best Physicians. Indeed that opening of Imposthumes which Nature makes, is without pain, and she chuses a better place for it than the Surgeon: Yet the proposition is not to be taken universally; for if the aperture be deferred so long in all cases, many and irreparable mischiefs follow, namely corruption of the bone, infecting the skin with a green colour, and a slower return to health.

Severinus.

II. It is the opinion of the most skillfull, that Tumours ought not to be opened till they are thoroughly suppurated, because otherwise the part is in danger of mortification, that humour being crude which Nature endeavours to turn into the form of Pus: And also such hasty opening will encrease the pain especially, which will cause a new conflux of humours. But this Rule admits of Exceptions: 1. where the native heat is weak, and there is fear lest the violence of the pain, or want of sleep bring a mortification on the part, before all the humour put on the form of matter. Therefore *Celsus* lib. 7. cap. 2. says, *If the matter be ripe, in the arm-pits and groins we must seldom cut: as neither whereforever there is but a small boy; nor lastly, when the malady is but just under the skin or in the top of the flesh, unless the weakness of the Patient compell us to make haste.* *Rhazes* confirms this 3 continent. cap. 2. 2. Section is to be made if there be that plenty of matter in the abscess that Nature cannot conquer. *Avicenna*, 3. 4. tract. 1. cap. 27. 3. When the matter is thick, seated deep, and is wide at the bottom but narrow toward the surface. (See *Avicenna* in the forecited place.) 4. If the member begin to be mortified, *Avicenna* ibid. cap. 25. 5. When the Imposthume is malignant: for an evil quality oppresses Nature, unless you make timely incision. 6. When it is in the neighbourhood of a principal member: for the matter being pent in annoys it with a foul vapour, with fear of recurring. 7. If it be about the Joints; because the matter being detained eats into the ligaments. 8. When it is upon the bones, nerves, tendons. So *Hippocrates* lib. 2. de morbis, *Those which happen near the fingers, are to be opened before they are perfectly ripe; lest they proceed to corrode and perforate the bone.* For the fingers, that are bloodless, small, remote from the fountain of heat, are easily tainted with corruption, because they make but small resistance. Therefore *Celsus* is not to be heard, who says, lib. 7. cap. 2. *When an abscess happens among the nerves, the utmost ripeness is to be carried for, which may extenuate the skin and join the pus to it, to find it the nearer.* So *Hippocrates* says of abscesses seated on the perineum (or between the genitals or fundament) in lib. de fistulis, *When any such tubercle shall begin to rise, cut it forthwith while it is yet crude, before the suppuration reach to the straight gut.* 9. If it be in glandulous parts, for these are subject to malignant putrefactions, and it makes little matter if such ignoble parts be a little mangled.

III. *Celsus* cap. 2. lib. 7. bids open them with a knife: *If the malady be deep, it is to be considered whether that place be nervous or no: for if it be without nerves, it ought to be opened with a red hot iron; but if nerves be near, fire is not proper: In these there is danger lest either the nerves be distended, or the member be weakened; but it is necessary to use a penknife.* But *Albucasis* lib. de canteris, orders the aperture to be made with a cautery; because by this means an imminent hemorrhagie is prevented, and also the part is secured from bad symptoms, which use to follow the puncture of a Nerve, if a penknife be used. Fire certainly (according to *Hippocrates*) is an enemy to the nerves, namely if the impression of it be deep; otherwise it strengthens the parts that it reaches to.

IV. A Souldier being wounded in the breast bled nothing for seven days: by the advice of a Surgeon a Plaster being applied to the wound, brought forth a great quantity of matter. Another was very ill of a Tumour that was suppurated, which not being

opened in time as it ought, the Patient was in danger of his life, the pus being pent in and hid; but we drew it out by the help of the following Plaster. *Take of new Resin of the Pine, clear and fragrant, one pound, of the oil of Bay, and Turpentine, of each two ounces, gum Elemi four ounces.* The resin and gum must first be so long in the vessel you melt them in, as till they are mixed, and afterwards add the turpentine and oil: let them all boil again; and at length strain them through a thick linen cloth; spread a little of this upon leather, and make a plaster to be applied to the part; change it once a day in winter and twice in summer, and you will admire the effect. Cut two or three long holes in the middle of it, that the matter which it draws may the better flow out.

P. Pachecq. in obseru. River. communicat. obs. 54.

V. They are in an error, who cut an Imposthume that is full of matter and hard, and let it all run out at once; they ought, for the asswaging of the pain, onely to let some part of it to go forth. For concocted pus when it is left in, deterges and cuts the matter which makes the hardness, and dissolves it. No topical Medicine is of that efficacy in taking away the hardness of an inflammation as pus is. Moreover when all the pus is evacuated, the humours often grow so hard and scirrhus, that they become incurable, and can be mastered neither by Resolvents nor Emollients: not by the former, because they consume what's thin, whence the remainder waxes hard like a stone; nor by the latter, because an hard humour ought to be cut and attenuated to the smallest particles, which cannot be done by external Emollients, but by the pus it self that touches the stubborn humour: for pus is the nearest efficient and of the same species, and alone can cut and attenuate it.

Sanctor. meth. 7. 15. c. 9.

VI. Because for the most part in the opening of Abscesses I find one Surgeon to chuse and extoll the Lancet, another a potential Cautery, I will explain the matter in a few words. A potential Cautery has this convenience, that it does not affright faint-hearted Patients, nor is very painful to those that are afraid of pain, especially if you make use of the famed remedies of this day: for Lime mixed with Holland Soap eats deep enough into the flesh, and much more gently than the holoserick Corrosive of *Paracelsus*; but it has these inconveniences, 1. That as the skin and body is more or less firm, it corrodes sometimes far deeper than is needfull: for I have found by experience that in one it corroded the skin and muscles even to the cavity of the belly; and in another it hurt in an incurable manner the process of the peritoneum, and the seminal vessels contained in it. 2. This corrosive extends it self also lengthways and breadthways farther than you desire, especially if it be to be laid on under the arm-pits, in the groins or joints; for as soon as it grows warm it begins to spread about, and will matter but little your defensive Plaster. 3. It needs some hours before it can perfectly finish its operation; yet more time is requisite in one body than in another: But the humour will not always permit of this leisure, especially if it be malignant. 4. The Eschar that it causes, does not presently fall off; so that if you would have the humours to issue forth out of hand you must use the Lancet for all it: Be as circumspect as you will, you cannot avoid these inconveniences. On the contrary the Lancet has these inconveniences, That many Patients are afraid of it, as if it caused pain; but the fear is to be prevented by not speaking of it, and indeed the pain is of no great moment. In the mean time you have these benefits by the Lancet: 1. By it you may make the aperture as long and deep as the malady and your curiosity require. 2. You have the matter quickly, and the Patient is relieved. 3. The matter that remains and which is not yet concocted, will be speedilier promoted towards concoction, by assisting Nature with fit Medicines as well internal as external. 4. And thus it will come to pass that you

you shall not have a long continued gleeing: for if a gleeing once begin, you may be sure that the fault is yours. If you desire a reason take this: Almost all Tumours that shew themselves behind the ears, in the neck, arm-pits and groins, arise from hardened glands, and from preternatural and very penetrating humours; All these kernels are clad with a proper coat, which being hurt by a Lancet or Cathartic Medicines, a gleeing necessarily follows: for no gland, when its coat is opened can preserve either it self or its humours: and this gleeing or dripping continues so long as till the hole in the coat be cured, or the whole gland be vanished and consumed.

P. Barbet.
chirurg. part.
2. cap. 17.

VII. Those are in an error that though the Abscesses be large, rais'd up copped under the skin, and situated in places that are least subject to an afflux of humours, do always content themselves with one simple section, forbearing from many and compound, as if every one should not be treated in a peculiar manner, and as if great ones should be treated like small ones, and mortified or unconcocted ones like those which have raised up the skin and are become copped. Let them consult *Celsus*, *Pautus* and *Avicen*, who have appointed different manners of dissection, and shewn which are necessary in such or such cases.

Severin. me.
dic. eff. p. 93.

VIII. The ignorance therefore of some is to be noted here, who pretend that Nature rejoices in the proper covering of the parts, which if it be taken off, the heat will not so well preserve its strength. The vanity of this superstitious providence is thus shewn: 'Tis true that Nature takes care for preserving the parts with a covering, but that is when they are sound and entire; for she intends to preserve such, and not corrupt parts. For the rind of a rotten Pomegranate covers and preserves all the rotten pulp and seeds: Now shall the rind be kept whole, to the end that the faultiness may be increased, and nothing be pared or opened? In like manner if we will not touch the skin with our knives for fear of uncovering the evil, we nourish and increase it. Thus while I have taken care of ulcerous persons in the Hospitals, when I have laid open fresh ulcers that had burst of their own accord, I have often found the tendons rotting and corrupting under them, though the ulcers seem'd not worth speaking of. Which ought to persuade us, as soon as the skin waxes soft with the malady, to cut it open, and apply such remedies as are fit for the purpose.

Severin. ibid.

IX. *Aquapendent* advises, that in cutting an Imposthume we make not the section so large, as that afterwards the skin can hardly be agglutinated to the muscles that lie under it, from whence a difficult motion of the Muscles may happen. But this caution is either to no purpose, or it has this sense, That the incision should not reach the Muscles also: For though it might happen that as they heal, the skin and they might grow together, yet however the motion of the Muscles might by that means be prejudic'd and not be so certain: for the skin always yields; and therefore he seems somewhat fearfull in cutting. Just as he was also superstitious in curing of a venereal *Bubo*, when he admonishes not to thrust in the knife too deep, because if the glands were wounded, death would presently follow, &c. I speak not this that I would have a man butcher'd, but neither on the other hand would I be content with pricking him; for that does not please me at all. It has happened to many (when a slight incision has been made of large sinuous abscesses) what *Hippocrates* 1 *Epid.* 6. writes of one that died languishing of a sinuous Ulcer, *If there had been a large incision made into it seasonably, he might have been saved.*

Idem. ibid.

X. Nor do I commend their advice, that with a cold moderation of mind doe the business by Causticks: For in these there are many things that may be condemned. The first is an inconvenience that the vir-

tue of the Caustick is not onely extended lengthways of the member, according to the desired form, but spreads it self also broadways; whence it is that it causes cruel pains and a great inflammation (which ought carefully to be avoided) in the parts, not onely in those to which the Caustick is applied, but in those next to them. Secondly, by reason the Eschar is long a falling off, and the parts that are laid bare are slowly restor'd, they doe not so much good as is expected from them. But cutting if it be skillfully performed, afflicts both less and a shorter while, and presently brings the desired help: and by cutting the skin in a line, it does no prejudice on either side.

Idem
ibid. p. 94.

XI. It is to be observed, that Tumours which suppurate slowly grow not copped, nor rise much outward: Therefore you must not wait for a head before you lance them.

Severinus
eff. chir.
p. 94.

XII. A young man going down *Mont Genis* and slipping on a sudden, fell upon his back, the hilt of his sword lighting under his short ribs and left kidney, and bruising his Loins very much. In which place a little after there began a great pain, with various symptoms, but without any sensible fever. The part affected was not black and blue, nor swelled, but very smooth and plain. A great quantity of humours from the whole body had flowed to the left muscle called *Psoas*, and being there pent in made an Abscess. A certain Physician thinking him Nephritical, gave him many things against the Stone. But being brought to a Surgeon who not long before had cured one in the same condition, he was told by him that there was matter shut up in the part which must have vent given to it; otherwise he would be in great danger if the Abscess should break inwards and the pus should be poured forth into the *Abdomen*. The young man committed himself to this Surgeon, whose first care was, that the matter, which was all over the Loins, should be drawn to such a place (by applying powerfull drawers) as where there were few large vessels, and the instruments of motion might be least hurt in the operation. Which after he thought he had obtained, from the Patient's sense of pain upon pressing a fit place, he forthwith made a wound on the left side of the fourth *Vertebra* of the Loins with a red hot knife, as deep as the length of ones forefinger (from the palm) as one might guess by the tent that was afterward put in. Then notwithstanding its depth he put his two fingers into the same wound to make it the wider, that the matter might flow the more plentifully out of it. But a little moderating the evacuation, the Surgeon put in it a silver pipe, which being besmeared with purging and deterging ointments, he used for some months; and at length the wound was skinn'd over, without any *filula* or *sinus* in it. *Eab. Hildan. cent. 1. observ. 63.* The same periton advises, in such deep wounds and ulcers as are near some internal cavity, as the Chest, or lower belly, to abstain wholly from injections that are made with a Syringe, lest some part of the injection go into the cavity, where it might be the cause of grievous symptoms with the danger of the Patient.

XIII. I saw an unmarried Woman forty years old, labouring under an Imposthume behind her left ear. About the fourteenth day of the Disease, when it was grown to the bigness of ones Fist, and the Matter was fully ripe, but retain'd too long through the toughness of the skin, it made its way downwards. When I was called, I found the Imposthume broke of it self some hours before, which run little or nothing; but a few days after the Woman died, when she had a Fever, Fainting and other Symptoms: Hence it appears that in Imposthumes of this kind, whether they be in the Emunstories or near them, we must not stay till they break of themselves, which this History confirms; ¶ There was a Boy three years old, who had an Imposthume about his right shoulder, the matter whereof when it was more than

cent. hist. 39.
c. 81.

enough digested, and the lancing of it denied, the swelling sunk by little and little, and fell by degrees into the lower belly and Genitals, where having extinguished the innate heat it produced a Gangrene. ¶ I saw almost the like case Anno 1668 in the Village Couffise in the Canton of Bern near Grandison. The Reverend Mr. Bourgeois Pastor of the Church, a full bodied man, who fared well, and omitted one Autumn his accustomed blood-letting, whereby he used to abate his Plethory: In the Winter following a huge Boylariseth in the upper part of his back, for which he was not so much as let blood. I and a Surgeon were called, and found the Abscess exceeding ripe, and pressing it with my fingers found it hollow: I bid the Surgeon use his Lancet, which he did; but the Patient felt it not. And he took great pieces of Flesh away. It cast out good and plentiful Matter; yet without Fever, Fainting, or any other grievous Symptome, his strength was perfect, and his stomach good: For I found him on his legs, not dreaming in the least of his death, which I signified to his Wife, who took me for mad. I took leave of my Patient, intending to return to Newenburgh in Switzerland, where I then practised Physick: But within three hours I was recalled to the assistance of the dying man, who a few hours after departed this life.

XIV. A Girl eight years old had a small Swelling sanguine and phlegmatick on the out side of the right under jaw. I fearing lest the scar should spoil her face, did before the Abscess came to break, resolve to try to disperise it; according to Guido, who saith that sometimes suppurated Imposthumes are cured by discution. After whose example Paræus cured such another Abscess with crude Mercury mixt with Diapalma. I in imitation of him mixed one drachm of the said Mercury with an ounce of Diapalma, and applied it to the suppurated Tumour, which within four days was wholly disperised. The following qualifications are requisite to the disperising of suppurated Matter. 1. That the quantity be but small. 2. That it be thin and serous. 3. That it be near the skin and surface of the Body. 4. That it be in a strong and young Body, and soft fleshed. 5. That it be Summer time.

XV. The Site of the Fibres is to be taken special heed of: for I observed, an ignorant Barber once opened an Imposthume on the forehead cross-ways: The Imposthume indeed was successfully cured, but the Patient was ever after deprived the benefit of his Eyes, except when he pasted up his eye-brows with Plasters. It were more advisable to leave such Imposthumes to Nature, than to commit the Incision of them to unskilfull hands. See Galen. 4. de administ. Anom. c. 1.

XVI. There lies a Nerve under the Buttocks, which if it be cut in Suppuration, or when it is laid bare, be hurt by cold, it leaves the Thigh under it benumbed. A certain man had an Imposthume in the bending of his Buttock where it ends in the Thigh, when the Matter was cleansed the Nerve was made bare, which being hurt by the cold, left the whole Thigh benumbed.

XVII. If there be but little Matter, there is no harm if all run out, which is fit and ready for running, without any violent or long pressing of it (a thing usual with many Surgeons) from which I could never yet observe any benefit to accrue to the Patient; but oft times much hurt. Indeed when the Matter resides in some place remote from the Orifice or is conveyed onely by a sinuous passage to the Orifice, then it is lawfull and requisite to squeeze it out by a gentle pressure of the Part.

XVIII. I saw a Woman whose belly was harder than any stone. I ordered Emplasti. de Mucilag. to be applied, when the place was grown redder and seem'd to give way a little, I ordered it to be lanced, and a good deep incision to be made, great store of Matter gushed out, and she recovered. The

Muscles of the Belly have a very thick Membrane, which except it be pierced, the Matter can scarce ever get out: Moreover I have observed these swellings, when they have not been cut, have turned into Stones, and the whole Mesentery for the same reason hath almost been as hard as a Stone.

XIX. A Boy having a swelling in his Belly was reckoned Hydropick, and when his navel stuck very much out, at last they opened the swelling, and there run out eight or ten pints of laudable Matter, and so he was well cured. Young Practitioners must observe, that such Imposthumes are often bred in Childrens Bellies, which resemble the Dropsie; and if they be opened by the Artift in Time, the Patient escapes for the most part certain death.

XX. If Pain seize any part of the Body, and you have any suspicion that matter is gathered there; if the party sweat, especially about his Face, and the Pain continue, you may certainly conclude that Matter is gathered in that part: Therefore though the colour of the Part be not changed yet it must be opened to let out the Matter. For it is backed with Experience.

XXI. Among all things which move or promote the excretion of Matter, I prefer and commend Antimonial Medicines. For I have often observed they have moreover a Virtue to correct all harms brought on the body by Matter, and to hinder the production of Matter anew. Because Antimony is not less serviceable to the Purification of man's body, than to that of Gold, if it be aright prepared and administered. Antimonium Diaphoreticum stops the continual generation of Matter from corrupt blood, and any other alterative Medicine made of Antimony; and especially the Balsam artificially prepared out of its Flowers, and Balsamus Sulphuris anisatus is good for the same, &c.

XXII. In the Cure of Abscesses after Child-bed you are to inform your self how the Womb is disturbed, and appease that: and if any part of the After-birth be left behind, to endeavour the bringing that away, and by good Sudorificks, Cordials, &c. to expell the venome, and fortify the spirits against the malignity that is thereby contracted, and to temperate the heat and acrimony by Juleps and Emulsions. The swellings arising from these require to be treated in their beginning with moderate Repellents and Discutients. Afterward, accordingly as the matter predominates, make way for its discharge; and cure them as in the treatise of Ulcers is shewed.

XXIII. A young Woman after Child-bed was seized with a great Pain and Swelling in her left Groin and Thigh with Fever. Sr. Charles Scarburgh and Dr. Weatherly were consulted. They prescribed Bleeding and lenient Purgatives, to evacuate the Humours: also cordial Juleps, &c. to temperate the heat and fortify her spirits against malignity. I was also call'd in, and by moderate Repellents mixt with Discutients in Fomentations and Emplasters with Bandage disperise the humour in the Thigh, and restored the part to its former temper: but in the meantime the Tumour increased in that Groin. I suppurated it after the manner of a Bubo, opened it, and endeavoured detersion: but the Sinus reaching down the Twist, the Matter could not be discharged without laying it more open as in Sinuous Ulcers; by which Method I cured it.

Medicines especially made use of by eminent Physicians.

1. To break inward Imposthumes in the body nothing is better than the Juice of Water Cresses: also the Juice of Garden Cresses, strained and drunk, quickly breaks an Imposthume.

2. Defilled Oil of Masterwort is one of the best discutient Medicines for hard Tumours, and unripe Imposthumes.

When in an Anchylops there is occasion for Repellers, when for Suppuraters. VI.

Medicines.

I. A Young Maid had a swelling at the inner corner of the left Eye, arisen from a Defluxion from her Head, which when it was prest, water ran out of her Eye (this was an *Ægylops*; but if it run not, it is an *Anchylops*) afterwards the Bone was eaten through to the Nostrils, and the Purulent Matter ran through them: We first purged the Head with Cephalick Pills; afterwards we laid on a Collyry to dry up the weeping moisture, resolving to try all things without the Instrument, lest the Face should be spoiled: Then we applied a potential Cautey to that part of the Nose, where there is no danger of the Orbicular Muscle of the Eye: After the fall of the Eschar, the Flesh grew so proud in the bottom, that we were forced to keep it back sometime with Precipitate, and often as the flesh increased, the Cure was retarded with repeated Causticks: At length when no Matter or Water came by the Nostrills, and we perceived the hole of the carious bone was filled with sound flesh, we made use of driers and cleansers of the bone; but without Instrument or fire prescribed by *Agineta*. Whereupon the wound was closed up with a small scar. ¶ If you find the bone carious, lay it as bare as you can, after frew plentifully upon it *Euphorbium*, finely powdered, than which nothing is better in carious bones. You need not fear the acrimony; for our *Euphorbium* does not inflame the adjacent flesh. But I would have a Seton first used, which is of such moment, that I have observed in several persons an inveterate lachrymal *Fistula* could scarce be cured without the help of this. Nor would I have any thing attempted, before the Seton have run for some time, and have drawn to it the Matter, which fell upon the *Fistula*.

II. There is another *Ægylops* often bred of a tough humour like gelly inclosed in a bladder which cannot be cured without opening the Tumour with a knife or a potential Cautey, and taking away of the skin; and then, lest the Ail return, a burning hot Cautey must be applied to cause an Eschar, which when it is fallen off, some beaten Allum mixt with Turpentine may be applied, till it be perfectly healed. ¶ Because this Swelling cannot be cured with Medicines alone, it must be taken hold on with a pair of Nippers, and cut round the bottom with a knife; yet so that the whole spongy Caruncle be not cut off, which is not unfitly called *The Bridle of Tears*: for upon taking it away a perpetual efflux

of them or an incurable *Rhyas* doth follow.

III. A Matron about thirty years of age after frequent inflammation of the Eyes and Head-ach had a Lachrymal *Fistula* arose, and was cured by the help of a Seton.

IV. Sometimes there are cancerous Ulcers in this part, which cannot be cured, except the part be burnt, and the Veins and Arteries especially be burnt thoroughly and to the quick: For so the cure will be most safe without fear of relapse, because when these Vessels are burnt, there can be no more new Defluxion.

V. In the burning an *Ægylops* I should with the more approved Physicians, prefer an actual Cautey before that they call Potential: But why do they order it to be of Gold rather than of any other matter? For one would think it might commodiously be made of Iron, nay perhaps more commodiously; seeing there is an astringent Virtue confest to be in Iron, a quality very requisite in this case: Again, Gold if it be violently heated, melts; if indifferently, it is to no purpose: Yet *Johannes Montanus* a great Physician, chuseth Gold or Brass in his Counsels; by reason the burning is greater, and the Scar deeper, than the tender particles here exposed can endure.

VI. All the difficulty in the Cure is about Repressers and Suppuraters, for either of them seem to incur the hazard of a *Fistula*: that indeed by repelling the humour to the Parts within; and this by putrifying: Nevertheless both must be done sometime of Necessity. When the Defluxion first begins, and the corner of the Eye ailed nothing before, repressers are convenient, for if this place never ailed any thing before, the Parts underneath are strong, therefore Repulsion should be made to the sides rather than directly under: But if in the process of the Disease an Inflammation arise, in this case Repulsion is no way convenient. Sometime we must use Suppuraters, when Nature hath already begun the Suppuration, and the Humour is Sanguine and in great plenty, & when Suppuration cannot be avoided, which when made though but imperfectly, the Abscess must be opened.

Medicines especially made use of by eminent Physicians.

1. Take of Fine Honey, *Aloe Hepatica* each 2 ounces, Myrrhe 1 ounce, Saffron half a drachm, Water 2 pounds. Boyl them over a gentle fire to half, let a new little Sponge be put in the hot decoction, wring it out, wrap it in a fine rag, bind it to the place, and you will see a wonderfull effect as I have often experienced.

2. I never found any thing better, than what follows; Take of *Aquaviva*, *mel Rosatum*, each 1 drachm, Myrrhe 2 drachms. Mix them, make a Liniment wherewith the part must be anointed morning and night.

3. Take Garden Rue, which Fullers use, beat it very fine and apply it, it cures this Ail excellently well. It is very biting at the first; but it will presently grow easy, and (which must be admired) it leaves either no Scar at all, or no disfiguring or remarkable one behind it.

4. Services bruised and applied are reckoned a singular Remedy.

Agonia, or Pangs of Death.

How persons at the point of Death are to be Revived.

When Physicians perceive the Hippocratical Signs of Death, they bid adieu to their Patients, lest they should expose themselves, their Art and their Medicines: But they should not be given up,

up, but all means rather should be used, which have any possibility to prolong life. For I have known several at the point of death, who have been given over by the Physicians and yet have recovered by inconsiderable means, I will give you my opinion freely; In the Heart, which is the last that dies, the vital Spirits are extinguished divers ways. I. By the excessive heat of the Blood: Cooling Potions and Epithemes to the Breast relieve such persons. II. Others die, when there is not a sufficient Affluence to the heart to continue the Circulation. 1. If new Chyle pass not to the Heart, either by reason of Expulsion of the Food by Dysentery, Vomiting, or some fault in the vessels of the Mesentery, or if it pass not by the proper ways: Transfusion of man's or Calf's blood would do good in this Case. 2. If the Blood, which should be carried back by the Veins, do clot and congeal, and this it does variously in various Diseases, in the Phthisick, deep Consumption and Fevers, the *Lympha* or usefull *Serum* is wanting in the blood; A warm bath, which dissolves the Coagulation, relieves such for a time: In Tartarous Diseases, as the Scurvy, &c. the Blood wanting Spirituous Parts is made tough and thick; such Patients begin to die at the extreme parts; warm baths also and spirituous Potions, which hinder Coagulation, do help such: In such, when they are dead the Arteries are flaccid, and the Veins do strut. III. The motion of the blood is choaked by suffocating Catarrhs, inasmuch as the Lungs (through which the Circulation of the Blood is made out of one Ventricle of the Heart into the other) and the Vessels of Respiration are choaked by a cold Viscidity: Let the sick Persons be laid on their side, that the Phlegm may run out at the mouth, apply a hot Pulsetis to the Throat and hot sand to the Head and Neck. Because Apoplectick persons die of such Phlegm stopping up the Ventricles of the Brain, Cupping the head and blistering the neck signify little if Apophlegmatisms will not do: The viscid Matter must be drawn out of the nostrils, the Patient's Head must be raised, and shaken a little, to make the matter descend. In an Agony, when there was rattling, and scarce any Breathing, hot Pulsettes, and Sand applied to the throat and breast, and a small draught of warm spirit of Wine with Oil of Almonds, recovered a man of Seventy. If the root of the Tongue and the Windpipe, have any glutinous stuff baked to them, Nitrous liquours and cleansing with a Surgeon's hand are good.

Alopecia, or Falling of the Hair.

We must proceed gradually in the application of Remedies.

Three kinds of Remedies ought to be provided, Weak ones which are of use in beginnings of Diseases, and in slight Ails, in hot Countries, and tender bodies, as of Children, Women and Persons of Quality; Moderate ones in midling bodies; and Strong ones in strong and old Disaffections. We have laid down this distinction, that it may be carefully observed in the present case, that two errors, that are frequently committed, may be avoided, that is, Ulceration of the skin by sharp Medicines, and Consumption of the innate moisture of the Part by driers, which usually cause an incurable Baldness. For that reason the place affected should be often look'd on, that we may know whether the Medicine applied be too weak or too sharp: For a weak Medicine either hath no effect at all, or a very slow one upon the body; and a strong one acts too violently and hastily upon it. *Rondeletius Pract. l. 1. c. 1. See Sennert. cap. 4. l. 5. Pract. part. 3. sect. 2.*

Medicines especially made use of by eminent Physicians

1. For falling of the Hair of long continuance, the juice of scorching Fennel, made into a Plaster is a present remedy. You need take no further care; for the outer skin will fall off, and when the Matter is cleansed, the Hair will grow of it self. *Ætius sctab. l. 2. f. 2. c. 25.*

2. Rub the place well; then cut an Onion very small, and beat it up with juice of Rhadish and a little Honey, rub the skin gently, then apply this; Take of the seed of Garden Cresses, Mouse-dung, Pepper, white Hellebore each a like quantity. Beat them up with Vinegar. *Id. ibid.*

3. In falling of the Hair, caused by rarity of the skin or defect of the Nutritive faculty, it is found by experience, that nothing can be devised better for shedding the Hair, than *Ladanum* mixt with *Oleum Lentiscinum*, or instead of *Ol. Lentisc.* with *Oleum Omphacium* drawn out of fowre Olives, applied to the Head when shaven. *Id. ibid.*

4. Mallow root is good to make the Hair grow thicker if the Head be washed with Lie made of Mallow root, and then the Hair be smeared with Juice of Mallows. The Hair will grow plentifully and speedily. *Bariellus hort. genial. p. 139.*

5. There is an admirable property in Willow root and Oil, to preserve the Hair from falling. The Bark of the Root burnt and powdered mixt with Styptic Wine, and Oil of Myrtle is very good for Children. *Bayrus de med. corp. hum. malis, l. 1. c. 2.*

6. I have often found by experience, when the hair of the Beard and Eyebrows have shed, that after Purging they have by the blessing of God been cured, who used the following remedy. I made a Decoction of Southernwood, and with the Ashes of it dried and burnt, I then made a *Lixivium*, by putting the said Ashes in the Decoction: I rubbed the bare places very well, I bathed them with the same warm Lie and washed them often. In a short time the Hair grew again.

7. One used a Plaster of Flies bruised made up with Turpentine and yolks of Eggs, and the Hair grew in great abundance. *Forest. l. 2. obs. 2.*

8. In falling of the Hair after Sicknes this is a singular remedy; Take of black Maiden hair, true Maiden hair, each half an handfull, Rose leaves, Myrtle, Wormwood, each one handfull: Boil them in sweet oil and red fowre Wine of each 9 ounces, till the Wine be consumed. Strain them and press them out. Then take of this Oil 3 ounces, of *Ladanum* 2 ounces and an half, Mastick half an ounce. Let the Gums be beaten in a Mortar with a hot pestil pouring in the Oil by little and little, then strow on and mix well of the Maiden hair 4 scruples. *Idem obs. 7.*

9. Burn *Nigella*, mix it with a little Water and apply it. This is found wonderfull good to bring Hair when you apply it to the Head or Chin, but especially to the Eyebrows. *Idem ibid.*

10. For Baldness. The Fat of Moles boiled in water is found to be a most excellent means to produce Hair. *Hartenffer nosodoch. p. 75.*

11. To make the Hair grow again; Take the Leaves of Water Lily, boil them well in fresh butter, strain them and then bear them well together again. Make an Ointment, wherewith anoint the place, and it will grow wonderfully. *Stokori prax. aurea l. 2. c. 1.*

12. I have tried in falling of the Hair, if the bare places be anointed with the juice of Yarrow and Oil of Bays mixt together, the Hair will come thick. *Arn. villa nou. l. 1. breuiat. c. 22.*

13. To make Hair come again on any place where the Hair is shed. Take the inner bark of Elm root, bruise it, boil it well in water, gather what swims at the top. Shave off what hair there is on the bald place, rub it violently with a cloth, till it grow red, then anoint with the foresaid liquor, If you do this often, you will make Hair grow quickly. *Idem l. 2. c. 47.*

Medicines.

I. IF the Belly be to be loosened, respect must be had to the Causes; if it be dried up, the Physician must neither give Aloes nor Scammony, nor any Purgatives, according to Hippocrates de m. m. If you would cause a stool, saith he, drink no Purge, but use other things; for, besides that it will do no good in this case, it will draw more to the Intestines. If heat be the cause of Costiveness, Mucilages of Linseed, Quince and Fleawort-seed may be put in the Clysters: by this means the thick and corrugated parts are made laxe, the hard are softened, and the heat of the Intestines passeth away in Steam: If the Faculty of the Guts be slow, languid and dull, they must be involuntarily excited to motion by sharp Clysters, in which you must leave out the oily things which are usually added, lest their Virtue be made dull: If one go not to stool because the Liver breeds no Choler, have a care of Rheubarb: If from abundance of Wind, the effect of a weak Stomach, *Hiera* should rather be given than *Cassia*: If from want of sustenance, more plenty of it must be allowed: for Weight and Pinching are causes that move the Expulsive Faculty. ¶ *Sennertus*, in *Epitome Instit.* blames the Weakness of the Muscles of the Belly (which also concur to the exclusion of the Excrements) Therefore Childbed Women go to stool with difficulty, not onely because of their long lying in Bed, but because their Muscles are weakened by their labour: Laxatives and meats of the like nature are here used to no purpose; some Turpentine rolled in Tiphany is more convenient, or Aloes, or Rheubarb, wherein there is some small Astringent beside the stimulating Virtue; or a motion is to be procured by sharp Clysters. A certain Melancholick person had a very costive Body, so that sometime he went not to stool once in six or seven days. He was cured by taking about two hours before Supper some stewed Prunes with their liquor, to which he added a small glass of Wine mixt with a great deal of water: half whereof he took before his Prunes, and the other half after: so he went well to stool; and this wrought better than Prunes alone are used to doe. A Matron about fifty complained that the strongest Purge would scarce work with her; I suspecting the heat and driness of her inwards (for she was Black, Hairy and Masculine) by giving her six drachms of Lenitive Electuary, and half a pint of Whey to be drunk upon it half an hour before Meal, obtain'd that which stronger means were not able to effect: For within a few hours she was very laxative. So I perform'd that by gentle means which the former Physician could not doe by stronger.

In Costiveness accompanied with Wind and tormenting Gripes, seeing then Acidity is joyned with the Viscidity of the Humours that turn to Wind, we must chiefly make use of some oily volatile Salt,

mixt with Opiates, and all other Aromatics, which are likewise good to break the Wind: But if mere Driness of the Excrements create this trouble in going to stool, the Excrements must be moistened and softened before they be voided, and this may be done over some Steam, or by application of a Flannel or Sponge impregnated with the emollient Decoction: for so the excrements will be softened and more easily voided. Besides, the Belly must be anointed with some emollient Unguent, that the Excrements may pass with more ease. A few days ago I was called by a person of Quality, I found a Child four years old very unhealthy, who went to stool but about once in three weeks, and in the meantime the Excrements were baked into Lumps, which you might distinctly touch through the Muscles of the Belly, and feel how big they were; nor were they voided without great pain, and sometimes loss of Blood, and Sweat all over the Body. After the use of an emollient Ointment, within eight days he went to stool several times with much Ease: I have frequently observed a Clyster of Milk with a little Honey of Roses hath done much good in such a case: for the Acidity, the usual companion of Wind, was tempered by reason of the Milk, and the Excrements were in some measure also loosened and softened.

II. It is not good to use looseners, as Apples, Prunes, or other fruit, frequently, and to cause plentiful evacuation; for they relax the Stomach, which when done, there can be no right concoction: Seeing we are inform'd, that the Stomach concocts food aright, when it is corrugated and contracted into itself, and that it embraces and contains the whole Mass till it be concocted.

III. Prunes loosen, especially if they be eaten not immediately but some time before Dinner, and alone: for we must remember these common directions for all Laxatives, out of *Galen. 2. de Aliment. fac.* The reason is, because they pass into the substance of the Body, for that they are not pure Medicines, but have something of Nourishment: Therefore they that give Manna and such things four or five hours distance from Meals, are ever disappointed of their End.

IV. In great obstructions of the Belly we have observed the Opening of it to be very difficult in several Patients. We must not pass in silence, what we have several times met with in our Practice, that when the Belly seem'd to be sufficiently emptied by purging Potions, and liquid Excrements were voided; nevertheless a great deal of other dry Excrements stayed behind in the Guts, and created a new Obstruction and repeated Pains. I was called to one sick of the Colick; when I had given him a purging Potion, and he had purged much liquid Excrements, and yet neither the load in his Belly nor his pains did cease; I therefore ordered a Clyster, which brought away great store of dry and hard Excrements: From whence I conjecture, the Potion brought away some liquid Excrements; but that it was not able to discharge the Load of hardened Excrements. But it is usefull in such an Affection of the Intestines to loosen the Body with a Clyster or two, and after to give a purging Potion, which if either it work too slow, or Purge but a little, you may last of all give a Clyster to remove the Obstruction with more expedition. In curing a costive Body, it is better to admit of several Clysters seasonably repeated, than to take any one lenient Potion whatever. One good Purge, administered with judgment in the Colick pain, does that at once which Clysters cannot well reach: especially in Colick pain from Obstruction of the Excrements above the Valve.

V. Sometime Colick Pains and many Symptomes arise from the hardened Excrements. I knew a Patient who was much troubled with a kind of hard swelling in his left side under the Spleen for two years.

years. His Physicians continually ordered him Ointments and Fomentations, without any benefit; at length more Symptoms coming upon him, he died. We opened his Body and found the exceeding hard Excrement was the cause of that old Swelling: And then we found the cause why the poor wretch sometime voided by stool certain green and exceeding hard round lumps; for the Excrement, by reason of its weight tending downwards, some portion of it turn'd globular, which was daily brought away by Clysters; and afterwards, by reason of the parching Heat of the great Artery, which was near the place, new Excrement was again joyned to that Mass, and so hardened: From the foreknowledge of this case I cured several such with two ounces of Oil of sweet Almonds, taken every day for a month together four hours before Meal.

Sanctorius
art. par. c. 94.

VI. The Feet should be held in some mollifying Decoction: for as Astringents are applied to the Soles of the Feet, and the Legs are bathed in some Astringent Bath, when we would bind a loose Body; So the same Parts may be bathed in some emollient Bath to make a Costive Body loose.

Fischer, med.
pr. 11.

VII. A Costive Body had brought a man almost to Death's door; Solutives, whether taken in at the Mouth or by Clyster, were used to no purpose. The Obstruction continued immovable for above a fortnight. The Belly rose in a hard swelling with preternatural Heat and worse Symptoms. I therefore, judging that a desperate Disease must have a desperate cure, gave six grains of *Tartarum Emeticum*, to be taken in fat Broth without salt, and ordered a suppository to be given at the same time: Upon this the long desired Discharge both upwards and downwards did succeed. The Patient was for a while very weak; but a little after he recovered perfectly.

IX. I knew a Man, who went to stool but once in a fortnight or three weeks, and ever with so hard straining, that blood started out of his Nose. Many laugh at *Ficinus*, who, *lib. de san. Studiis*, cautions men not to strain too hard in going to stool for fear of an Apoplexy or Epilepsy. What such hard straining can do, this present Instance doth shew: Nor is it any wonder to me that the Veins and Arteries in the *Plexus Choroideus* (part whereof reaches to the Ventricles of the Brain) should either be burst or so strained, as to straiten the Brain; and so cause those Diseases.

Ph. Salmuth.
cen. 3. obs.

X. The Excrements are often gathered in the upper and larger part of the *Colon* near the Liver and Stomach: And because the Body is perspirable, if at any time one be slow in going to stool, the Stomach grows squeamish by reason of the filthy stink of the Excrements, the appetite is destroyed, the Heart faints, and the Brain is stuffed and oppressed; then nothing is better than to wash the Guts with Clysters.

Riolan. an-
thropograph.

XI. Phlegm bred in the Stomach conduces to the better expulsion of the Excrements; for unless the Intestines be moist and slippery, Excretion will be difficult. We understand the necessity of this thing from some persons troubled with the Colick, whose Guts were so fadden with Clysters, Fomentations, and all sorts of Medicines, that they were like Leather; such never go to stool except forced.

Riolanus in
Enchirid.

XII. The Ancients used pickled Meats, and they are left off by us, to the great detriment of the Sick; For it is certain, that these Pickled things did not onely cut Phlegm and provoke to Stool; but they exceedingly strengthened the Stomach, helped Concoction, and stirred up an Appetite. But if the Body itch, we must abstain from them.

Aneurisma, or an Aneurism.

The Contents.

Its Nature and Cure. I.

Cured by Purging. II.

Cured by hard Binding. III.

Opening seldom safe. IV.

A Caution when an Artery is opened instead of a Vein. V.

Cured with a Cap of beaten Lead. VI.

Medicines.

I. I Could never conceive how the inner coat of an
Artery can be broke which is thick, and the
outer Coat, which is as thin as a Cobweb, should en-
dure whole (which is *Sennertus* his opinion) and so
breed an Aneurism, when indeed there is no such
distinction of Coats at all. But I acknowledge it may
be bred two ways; One way from an External;
Another from an Internal cause: The External is a
Wound made in the Artery by an unskilfull Surgeon.
For the Artery may be skinned over, and yet not
so soundly healed, but that the Blood, forcing vio-
lently on the weak part of the Coat, may raise a
Tumour upon it: The internal cause is the Opening
or *Angustiosis* of a little Artery, by which the Blood
passing into the empty space or Interstice of the
Mufcles, is congealed into a Clod, which increasing
by degrees, and by continuance being more con-
cocted, turns into a fleshy Mass, not unlike the
Mufcles, which is found hollow, and contains in its
middle plenty of black clotted Blood. And in what
I say, I am back'd with experience, acquired by
Dissection of an Aneurism in *Venice*, Anno 1643. and
with the Testimony of famous *Bogdanus*, *Observat. Med.* 8.
But as the first case may be cured by binding and
pressing the Tumour; so the second case scarce ad-
mits of any cure at all, unless one will cut the Arte-
ry, by dividing the skin take away the fleshy lump,
and fill up the broken Artery with new flesh by Sar-
coticks. I and a Surgeon were called to cure an A-
neurism, occasioned by letting of Blood, I presently
threw

L. Van Hooi
microtech.
sec. 2. c. 16.

Horstius,
Tom. 2. Lib.
9. Obs. 1.

threw away the things which were improperly applied to soften the Tumour; because Gangrene, Mortification and Corruption of the Part do follow such Softning and Suppuration. The Part affected is very often the Neck, because of the Carotid Arteries. Yet I have observed it in the Arms and Legs. The Cause is a sharp, serous and bilious Humour, eating either one or both the Coats of the Artery, and sometime the neighbouring Bones. Surgeons, ignorant in their own Art, take it for an Abscess, and having opened it with an Instrument, the Patient dies immediately in their very presence. The Tumour must in the Beginning be compressed presently, and the sharp Humour repelled: Both these things may commodiously be done by a thin Plate of Lead. I cured a poor man palliatively by this means, so that he lived fifteen years after it: The Swelling was above his right Knee, as big as a Hen's Egg. Some advise to intercept the flux of Blood, by tying the Artery above and below the Aneurism, and when you have cut it to heal it: But this is a painful kind of Remedy; nor is it safe. I had rather, to save ones Life, cut off an Arm or a Leg. We dissected the Body of a poor Man, who died of an Aneurism, we found plenty of Blood, both Serous and Grumous, and both Coats of the Arteries and the greatest part of the Collar Bone on the Left side eroded.

P. Barbetto,
Præf. lib. 2.
c. 3.

II. One was let Blood in the Basilick Vein for an Itch caused by a Melancholick Humour, and the Artery was also prickt, whereupon, by little and little, an Aneurism arose, to which, when for above a Months time they had applied several things to no purpose, and they were past hopes of saving his Arm, he came to me. I found the Swelling as big as a Goose Egg, pale and also hard, in which you might not only feel a Pulsation with your Finger, but you might perceive it by your Eye. I with much entreaty undertook the Cure thus. When I had in the first place ordered his Diet, and applied my Plaster of Hemlock to the hard Swelling, he took a Clyster, and a Julep to digest Melancholick Humours. I then gave him a Purge, which when it had discharged the Noxious Humours both upwards and downwards with great Violence, it so recalled the Spirits and Blood, which were in the Aneurism, to the inner parts, that the next day we could perceive no Pulsation: The Swelling also was much fallen; then I applied the following Plaster. *Take of Emplastrum Diachalcitæ, Two Ounces; Powder of Mastick, Red Roses, Myrtle, Comfrey Roots, each One Ounce, Oil of Roses what is sufficient.* Afterwards I made a Bolster, or rather a Knot of Linen, often doubled, and laid it on the Tumour, and bound it fast with a Roller, to repress the Tumour, and hinder the influx of the Blood out of the Artery into the outer Membrane dilated. And by these Remedies the Arm was perfectly restored.

Fabricius
Hildanus,
Cent. 3. Obs.
44.

III. One prickt with the point of a very sharp knife an Artery in his Left Hand, between the Thumb and Fore-finger, the Blood run out by leaps; with an Astringent Plaster applied in time, the outer Coat of the Artery closed presently, but the inner remained open, and they were parted one from the other: Therefore the outer Membrane was so elevated by the vital Blood, that it degenerated into a true Aneurism, with a continual Pulsation and Pain in the adjacent Nerves. You could no sooner press this Pulsatile Tumour with your Fingers, but the Blood presently gushed back to the Veins, and the Aneurism seemed to be gone: But it immediately came in View again, if you removed your fingers never so little. Surgeons were not wanting who would gladly have seared the Artery across with a hot Iron; but the Remedy would have been more cruel than the nature of the Disease required, and therefore we made tryal rather of an Astringent Plaster, and bound it so strait with a Plate of Lead, that when the Blood was forced out of the Tumour, and the gaping of the wound con-

veniently shut, the inner Coat of the torn Artery might close, and grow together: And it did close within five Months, there remained onely a little Knot about the Scar, which at length also vanished, before the Aneurism was perfectly cured.

Tulpius, c.
16. lib. 4.
Obs. 1.

IV. A Woman beat her Son, about Seven years old, on the left side of the Head with a Stick, upon the place where the Carotid Arteries pass, whereupon a Pulsatile Tumour, like a Walnut at first, black, and yielding to the fingers, presently arose, and within eight days grew so big, that it spread over half the head, from the Sagittal Suture over the Temples and Forehead, to the very Eyes: The Physicians, upon Consultation, judging a doubtful Remedy should be preferred before most certain hazard of Life, open the Swelling with an Instrument, and taking away some part of the Blood, which gusht violently out, and stopping what remain'd with strait Ligature and Astringents; and doing thus frequently, they perfectly cured the Boy in a few days; Either because in young Persons all things are tender, and easily grow together; or because the hurt Artery had a bone under it, and so might be bound the harder to make it close. Hence Riolanus affirms, That the Arteries of the Temples and Forehead may be safely opened. Few find an Aneurism doe well, because the Arteries will not endure opening: Yet sometimes the strength of Nature conquers the Disease, a strait Ligature doth now and then miraculously close a gaping Artery. But we experience the Effect of this Operation onely in the lesser Arteries: for in the greater, the Coats, because they are thick, are not easily broken, unless of a violent Cause, and the Ruptures are healed up with more difficulty, and the Aneurism, because of the continual afflux of Spirituous Blood, daily increases. The hoped Cure succeeds better where the Coat of the Artery is dilated, than where it is quite broken. And upon the Blood's being hot, and so inclined to Violent Motion, or its being cold and thick, and so slow in Motion, the Cure or Death of the Patient doth in a great Measure depend. We saw a Mortal Aneurism in a young Man, who had hurt his Thigh, nor did we wonder at it, for in opening it, we found the great Crural Artery broken, whereupon the Thigh swelled so much, that it seem'd quite Scirrhus; and after he was dead, and his Thigh opened, there run out not onely as much Blood as would fill three of our Measures, but we took out of the Sinus's, which were made between these vast Muscles, Grumous Blood, resembling, in shape and bigness, the Parenchyma of the greatest Liver: While he was alive neither Section was safe or possible, because of the huge breach of the great Artery, and of its Lying among the Muscles; nor was Ligature sufficient. I advise the young Surgeon not to open Aneurisms unadvisedly, unless they be small, and in an Ignoble Part, and have no Vessels remarkable. Let him rather take this Course of Cure: Lay the Skin over it open till you find the Artery, separate it on every side from the Parts about it; run under it a blunt crooked Needle with a Thread in it, bind it, and cut it off; you must tarry till the Threads tied about it fall off themselves, and till Nature have filled the Ends of the cut Artery with Flesh, and then the rest must be healed up as in the Cure of simple Wounds.

Epist. 54.

Parsus.

V. A Surgeon, when he was Letting a Man Blood that was sick of a continual Fever, opened an Artery instead of a Vein. The famous *Garcias à Lopes*, a Jewish Physician of *Burdeaux*, standing by, suffered him to Bleed above Two Pounds, till he was ready to faint, on purpose, that the Vessels about the Part being drained, the Pulsation of the Artery, which would have hindered the healing of it, might be less: Then applying a piece of Silver with a Bolster, it was hard bound; it was loosed after Eight days, and the Patient escaped the danger of an Aneurism.

He was rid of his Fever by the large Evacuation of Blood; but he was faint a long time after.

VI. I have had many brought to me with swelled Necks, upon suspicion that they were troubled with a Species of King's Evil, called *Bronchocele*: but the Pullation of those Tumours shewed them to be Aneurisms, and the most difficult to treat; they, by reason of their Situation, not being capable of Bandage. In which cases I commonly proposed the wearing of a Cap of beaten Lead, made of many Sheets laid upon one another, and covered with Silk or Sarfenet, which with Ribbons were made to fasten about the Neck with much ease: or, if they would have Emplasters, I applied some of a mixture of *Unguent. fumach.* with *Emplast. Casaris*, or such like.

Discurrent Bags are bad. XXVI.

I. **W**HETHER a Vein should be opened in every Quinsey? The Negative seems probable according to the Opinion of *Mesue*, who sometimes orders a Purge before Blood-letting, especially when the matter peccant is also Choleric or Phlegmatick; because the Choleric matter boils and ferments higher, when the Blood is taken away,

and the Phlegmatick matter usually causeth greater crudity. Nay, if what *Avicenna* saith be true, That it is better the strength should remain in the Body, and that the peccant Matter should be taken away by Evacuation; it of necessity follows, that in a Quinsey, caused by a Choleric or a Phlegmatick Inflammation, Blood must not be let in the beginning; seeing by this means faintness follows, and Choler or Phlegm are not first purged, which certainly indicate Purging of the Matter rather than Blood-letting. But we defend the contrary with the greater number, *scil.* That in every Quinsey, whether the Blood offend with Choler or Phlegm, or alone, we must begin with Blood-letting, if nothing hinder; because in the beginning a Man must presently take care to stop the afflux of Humours to the part affected, which may conveniently be done by letting of Blood, which draws back the affluent Matter from the part affected: For as in other Inflammations Blood is let, not in respect of that Matter, which hath already actually caused an Imposthume in any part, but for Preservation's sake, in respect of the Matter yet affluent and increasing the Inflammation; so here we prescribe Blood-letting in the beginning, lest the Inflammation should be increased by the affluent Humours, and there should be imminent danger of present Suffocation.

Gr. Horstius,
Problem.
Dec. 4.
Quest. 4.

II. Seeing a Quinsey is a most acute Disease, and that sometime it takes a Man away in one day; the Great Remedies are to be used with huge Care and Diligence. Therefore, at what hour of the day soever a Physician is called, let him take away Blood presently, from the same side the part grieved is on, to one pound, a pound and an half, or two pounds, as the Patient can bear it: For the principal hope of safety must rely on this Remedy. Yet so great a Quantity of Blood must not be taken at once, lest the Patient fall in a swoon, whereby his life would greatly be endangered; but at several times, that is, once in three or four hours.

Riverius
Praxicos, lib.
6. c. 7.

III. If you meet with a Woman in a Quinsey, who has her Months stop, or is in daily expectation of them, or actually has them, What must then be done? I would not have you follow them that breathe the upper Veins; for at this time you must breathe the lower. *Trallianus* teacheth this, lib. 4. c. 1. And Reason teacheth it: For in this kind of Blood-letting there is not onely Revulsion, but also an Evacuation of the accustomed natural Purgation, which hugely helps the Inflammation. But if Strangling perplex you, when you have opened the lower Veins, you may with safety open a Vein under the Tongue: For this Blood-letting draws not from the Womb, nor from the whole Body; but onely evacuates the Part affected.

Saxonia Pra-
lecta, pract. co-
de Angina.

IV. A Man of Fifty newly fallen sick, was taken about Midnight with so violent a Quinsey, that he was not able to speak one word. A Surgeon was called, who let him Blood under the Tongue, and in a short time he recovered. *Saxonia* Writes, that the opening of the Sublingual Veins should not be onely once, but repeated twice or thrice, as necessity requires, and Suffocation is urgent.

Rolincet-
us, Consil. v.
lib. 3.

V. The Ancients in a desperate Quinsey opened the Jugular Veins, which Remedy, although it be approved by most of the Moderns, is grown quite out of use in our times, because it is accounted dangerous, but erroneously. *Trallianus*, l. 4. c. 1. saith, He Cured several of the Quinsey by opening these Veins. ¶ I had under my Cure, Anno 1675. in the Month of May, Mr. Dennis Bordier of Geneva, a lusty Man, taken with a Quinsey and an acute Fever, although his Breathing and Swallowing were easie enough; I bled him in the Arm, the Blood run very pure, but without any ease; I bled him under the Tongue also without any Benefit: But when I opened the Jugular on that side, where was most Pain, very Putrid Blood ran out like a Rivulet, to his sudden and manifest Ease. Although this Ail ended in a Peripneumony,

Peripneumony, from which he shortly recovered by repeated Blood-letting and Expectoration.

Lanfrancus
Chirurgie
lib. 2. c. 17. 3.
c. 5.

VI. A Matron of Fifty had a Phlegmatick Quinsy all over her Throat, within and without; the Swelling appeared great outwardly, her Swallowing and Speech were hindered: When I touched the place, I found Matter lye deep; wherefore I knew that she would be choaked before the Imposthume would break, either inwards or outwards; and feeling of it with my fingers, I found ripe Matter gathered more between her Chin and the Epiglottis, than any where else, and avoiding the Nerves and Vessels, I made a deep Wound in that place, out of which I took a good share of the Matter, leaving much behind. Then she took her Breath better, and the Fear of Death abated, &c.

P. Barbetto,
Prax. Med.
l. 2. c. 1.

VII. The Wife of N. being Plethorick, underwent most exquisite pains in her Jaws, her Tonsils were so swelled, that she could not swallow one drop, but threw whatever she took out at her Nostrils. I ordered Blood-letting, I used Cataplasms and Gargarisms, and the fourth day of the Disease, as I was searching the Sore with a Probe, I saw the Abscess suppurated: I was resolved to treat her somewhat inhumanely, I broke the Abscess with the very same Probe; upon which, when the presently grew better, she Laught, and commended my honest Cheat.

VIII. Benvenuto, when a Man was almost strangled by a latent Quinsy, and given up for Dead, cut the place with deep Gashes under the Jaws, and on the Throat also, out of which there run much Corruption, and so rais'd the Man from Death to Life.

IX. Cutting the Windpipe is seldom put in practice, for fear of Disgrace, if when the Operation is perform'd, the Patient should Dy: Besides, in a very dangerous Quinsy, the Lungs are often afflicted and stuffed with Humours, which choke Men; in which Case this Operation is practised to no purpose. Yet Examples are not wanting of those that have had good success in it. Famous Renatus Moreau used it in a Gardiner and a Soldier, both which recovered of their Disease and Wound, onely in the latter there remained a little hoarseness in his voice. The celebrated Tulpus, obs. 50. l. 1. shews, that Wounds of this nature heal quickly. Things that were never tried seem terrible, which, after they have been once practised, are used as confidently as they are perform'd easily. This is confirm'd by the Opening of the Jugular Veins, now very usual, and by Cutting for the Stone. The way of performing the Operation is thus; Let the Patient be set in a Chair, with his Head leaning back as much as he well can: let the Servant standing behind him, take up the skin on each side of the forepart of the Neck, and the Surgeon must cut the Skin length-ways with the Muscles under it, just against the *Aspera Arteria*, not far from the pit of the Throat, and with a broad Lancet he must divide the Space between the Cartilages, and having made a hole, he must put in a Silver Pipe, a little crooked with Legs: By this way the Breath goes and comes to the Lungs, till the Inflammation be either dispersed, or brought to Suppuration, and a passage for breathing by the Mouth be restored.

J. Van-Horne
Michtroscopia,
Sect. 17.

X. In that sort of Quinsy, where the Muscles of the Larynx are inflamed, called, *The Dog Quinsy*, Breath may be restored to the Choaking Patient, by the help of Laryngotomy, an Operation less hazardous than the Disease. Nevertheless here great Circumspection must be used, lest, if other parts also, as the *Pleura*, Lungs, Gullet, &c. be inflamed, or full of Matter, the labour be in vain, and so give occasion for Reproach. All things therefore well considered, the Operation may be gone about in this manner; Let the Head be bent back a little, that the *Trachea* may come more in sight, and the Cartilaginous Rings may part the wider one from another: Let the Skin of the Wind-pipe be cut length-ways to the Pit: Let it be drawn asunder by the Servant's

fingers on each side, that the Surgeon may see the *Sternothyroideus* Muscles, which are to be parted one from another with a Wooden or Ivory Knife: After the Windpipe shews it self, Section must be made with a Lancet, in the middle space, between the third and fourth Cartilaginous Ring, taking diligent care that the Cartilages themselves be not hurt. When the Wind comes out, take away your Instrument, and fasten a Silver Pipe in the Wound: Care must be taken that it be not over long, nor touch the back-part of the Windpipe, for then it would cause continual Coughing. When the danger of Choaking is over, which usually comes to pass in three or four days, the Pipe must be taken away, and the Wound cured the ordinary way according to Art: for it differs not from other Wounds.

Barbetto,
Prax. P. m.
130.

Chalmereus
Enchir. P.
113.

XI. When the Imposthume is opened, care must be taken that the Corruption fall not on the Lungs, nor into the Stomach, for fear of another Disease; but it must carefully be cast up at the Mouth, and then a Gargarism of *Hydromel* used often is good for Deterision, &c.

XII. One had been sick of a Bastard Quinsy, and he often Relapsed: Because some thin Matter alway flow'd to the foresaid parts, I therefore ordered him an Issue in one of his Arms, which we tried as the last Remedy; and by God's Assistance we restored the Patient to perfect Health.

Mercurialis
Consul. Med.
2.

XIII. There are some, who in that sort of Quinsy, which is caused by a *Vertebra* of the Neck split inwards, use Cupping glasses, thinking by that means they may draw the dislocated *Vertebra* outwards again, which Hippocrates expressly forbids, lib. de Articulis. But it is great weakness to think to draw out the *Verticles* split inwards, by applying Cupping Glasses: for they rather drive forward than backward, nor do those that set them on, take notice of this: for by how much faster they set them on, so much the more crooked are they made to whom they are applied; because they shrink the outer skin together.

XIV. When the Patient has bled enough, he may be purged the day following, never waiting for the Coction of the Humours, because the Disease gives no Truce: Nay, if that it be very violent, you may bleed and Purge the same day; which *Trallianus* saith he did; l. 4. c. 1. But it must be done with gentle Medicines, because of the Inflammation. After the Patient has been let Blood, the next morning, if the Fever and Pain be any thing abated, I presently give him a gentle Purge, which, after Blood-letting, is the best thing can be done, and by often experience I have found it highly necessary: If afterwards, which seldom happens, the Fever and other Symptoms invade him, they must be encounter'd with repeated Blood-letting as before. Through the whole course of this Disease, I order every morning a Cooling emollient Clyster, except the day allotted for Purging.

Riverius, l.
6. c. 7.

XV. There are some that prescribe Gargarisms of some sower and bitter things, that are not very ingratefull to the Taste, for repelling the Humour: Yet I suspect the use of these things in this case, because the Parts Inflamed should be quiet; but the Throat and Jaws are moved by Gargling: Therefore I would either have them not used at all, or held in the Mouth without stirring, lying on ones back, that they may come to the Part affected: Then I prescribe the following Gargarism, not to be used the common way, but to be kept in the Mouth without Gargling, till it be hot, then to be spit out, and more taken. Take of Water of Plantain, Red Roses, and Frog Spawn, each four ounces, three Whites of Eggs beaten to water, of White Sugar-Candy three Drachms, make a Gargarism.

Enchir. Med.
Pr.

Sydenham,
loc. supra
cit.

XVI. Galen and his followers; in all sorts of Quinsies, from the Beginning, use cold and astringent Gargarisms, contrary to the Precept of Hippocrates 4. de rat. vi. in acut. vers. 72. who prescribes Gargarisms actually hot. They mistake, not considering how such Medicines cause certain and speedy Suffocation.

in the Quinsey, which depends on Phlegmatick Matter, seeing it gives not place to Repellents, but being thickned and more settled in the Part, it is rendered more unfit for Discussion, and readier for Suffocation: and in that which comes of sharp and thin Matter, although they be not so pernicious, yet they may doe more hurt than good; for since they cannot repell upwards the Matter descending from the Head, when it is forced either to the inner parts of the Muscles of the Throat, or upon the Lunges; they may make the Disease more dangerous. Hippocrates his Advice is better, whom all the Ancients follow'd (as you may see, 6. de comp. Med.) while he thinks good in all sorts of Quinseys, and at all times, to abstain from Repellents, and always to use Rarefiers and Discutients, that the Matter may more easily be raised by Spittle, and be driven outward and discuss'd. Nor is there any fear the Flux should increase, seeing it may be prevented by Bleeding and Purging, and other Remedies respecting the Matter fluent. And if at any time he would have some Astringents mixt with the foresaid Medicines, when the Matter is thin, he does it not because he would repell, but that by their drying virtue, he might avoid too great laxity of the Part, and that he might lessen the Swelling: Therefore he approves the use of them rather in the Beginning, than at another Time, as appears from lib. 2. de morb. sect. 1. vers. 24.

XVII. Humours sticking in the Flesh, which are wholly extravasated, cannot run because of the thicknes: Therefore the Physician must make them fluxile with hot Medicines: If one taken with a Quinsey, do, in the beginning of the Disease, Gargle himself with Spirit of Wine, all Inflammation of the Throat will cease in three hours time.

XVIII. Whether a Swallow's Nest be of use? Some disapprove it, as *Mercurialis*, because the Virtue lies not in the Nest, but in the Bird: But grant the Bird be endowed with such a peculiar Virtue, yet it ought not be denied the Nest, because the Nest may have it from the Excrements of the young ones, which are full of Salt. Neither ought it to be rejected for the repellent virtue of the Earth, as *Pereda* doth, because all Earth hath not a Repulsive Virtue; nor is it desired alone, but for the sake of the Dung mixt with it, which is sharp and Discutient, whose sharpness the Earth qualifies. Therefore it is a Remedy most proper to discuss Tumours, chiefly of the Jaws and Throat; especially if the Bird have a peculiar virtue against the Quinsey. If the Quinsey be Phlegmatick, Swallow's Dung used inwardly and outwardly is good: But a bilious one is exasperated by the use of sharp Medicines: It concocts and discusses Phlegmatick Humours, and dries up the superfluous Moisture.

XIX. *J. Tiengius* had a Nun under Cure, that had an Imposthume in her Throat, which was Twenty days before it broke, or she could swallow any Food: He ordered now and then a Clyster of sweet Milk boild with Yelks of Eggs. *Amatus* teaches the same, when the Quinsey is upon the Windpipe and Gullet, that Broths given by way of Clyster are able to nourish: *Celsus* and others affirm the same. We kept a Religious Woman alive in a Quinsey for nine days onely with Clysters, and she recovered of her Sickness. *Brassavolus* comm. ad aphor. 15. Sect. 2.

XX. In a Quinsey Symptomatick of a Malignant Fever, we must doe nothing before the great Heat be laid, the Body evacuated and altered, and the Parts be preserved against the Poyson.

XXI. Then Sleep, as in all inward Inflammations, so in this likewise, must be avoided, to our utmost power; for, according to the Prince of Physicians, in sleep the Blood retires inwards; therefore the Defluxion of the Humours to the part affected may be increased.

XXII. A Learned Man of a Sanguine Temper, inclining to aduſt, was taken with a Bastard Quinsey without a Fever, he swallowed difficultly, and found

some straitness about his Jaws: He tried many things to quiet his troublesome Disease, supposing it came of a Defluxion from the Brain, although there were more signs that that was dry: He Purged his Head often with Pills, he prescribed to himself (for he was a Physician) a Drying and Sweating Diet, he endeavoured to dry his Head with Bags, Plasters, &c. he used Apophlegmatifins, Sneezing, yea, and made an Issue behind in his Head; all in vain. At that time I was following my Studies at Paris, he sent me a Description of his Disease, to shew it to some famous Physicians. I consulted severally with Monsieur *Carolus Buvardus*, Chief Physician to Lewis XIII. with Monsieur *Curæus de la Chambre*, Physician to the High Chancellour, and with Monsieur *Hurdynus de S. Jaques*, Physician to the Hospital of Charity: They well considering the Constitution of the Patient, declared, The Disease was Sympathick, arising from Fumes ascending from the *Hypochondria*, affecting the Top of the Chimney, i.e. the Gullet, and that the tempering and exclusion of Melancholick Humours must be lookt after; they prescribed him Spaw Waters, the use of Chalybeates, an Issue in each Leg, and stopt up that in his head; they order'd Leeches to the Hemorrhoids, and other things to conquer the Melancholick Humours. The Patient consented, who a little after was rid both of his Melancholy and his Quinsey.

XXIII. In this Controverſie I think we must take great notice, whether the Body abound with Blood, either naturally, or because of the manner of living, or of some accustomed Evacuation stopt; for then I think we should bleed in the Ham or the Ankle; and the same day, if the Disease be urgent, or the next, to Breathe the Jecorary, or Cephalick Vein; and if the Disease abate not, we must proceed to bleed under the Tongue. But if there be no such great plenty of Blood, I think it better not to meddle with the Veins of the lower parts; but presently to open a Vein in the Arm, and afterwards to bleed in the upper Veins.

XXIV. But Blood-letting in the Arm must be repeated, not onely because it makes better Revulſion, and causeth less weaknes; but because it is often observed, that there is new afflux to the Part affected, either from some other Part transfusing Matter, that it may ease it self of the burthen where with it is oppressed; or by the Part affected drawing, by reason of its pain and heat.

XXV. And seeing some either in the Working of their Physick, or that they naturally abhor it, are apt to vomit it up again; it is better always to give Potions than Pills or Bolus's: for if they should happen to Vomit either a Bolus or Pills, when they are suddenly and with great Violence forced to the Passage straitned with the Inflammation, there is no small danger of Strangling.

XXVI. Bags that are made up with drying Powders, to discuss in Inflammations of other parts, must never be made use of in the Quinsey, because by thickning the outer Skin, they rather hinder the Cure; Therefore we must rather work with Moistners.

Medicines especially made use of by eminent Physicians.

1. I have used in an Inward Quinsey a Gargarism of Mustard, and have often delivered my Patients from danger.

2. If the Swelling in the Neck will not soften; burn an Owl in an open Pot to Powder, a little of which you may blow into the Throat. The Swelling will soften to admiration, and break. This is a Singular Secret.

3. Duke *Ferdinand's* Powder is a great Secret in the Quinsey. It is made of Mineral Crystal, Cream of Tartar and Sugar. For every half ounce of Crystal, 1 ounce of Cream of Tartar, and 2 ounces of Sugar are taken.

4. A Purple Thread, wherewith a Viper hath been strangled, is highly commended for the Quinsy.

5. Let the Water, or Decoction of Elder Flowers, wherein is mixt a little Elder Honey, and a few Leaves, with one or two Jew's Ears, be Gargled. This is recommended by experience.

6. Spirit of Nitre, with Water of the Anodyne Salt, Gargled hot, is most excellent to allay the Inflammation.

7. Take of Houfeleek a sufficient quantity, bruise it and strain it; Take of this Juice 1 pint, Sal Ammoniack half an ounce, leave it in a moist place, till the Salt be dissolved. Distill it by an Alembick. Wash your Tongue often with this Water.

8. Galen, Aetius, Orobafius, and all the Ancients commend Dogs-Turd White, powdered and dried, mixed with Honey, and laid to the Throat.

9. The Juice of Tree-Ivy swallowed gently, from 3 drachms to half an ounce, doth much good by repelling and digesting.

10. This is an Excellent Remedy. Take of Swallow's Nest 3 ounces, Sapa 1 ounce, Pulp of Cassia newly drawn 1 ounce and an half; Mix them, and apply it outwardly: For it digests and asswages.

11. This also is admirable, which is made of the crum of a Loaf, Milk, Flowers of Roses and Chamemil mixt together, and applied after Blood-letting, by virtue of which Medicine they use to spit plentifully, and be much relieved.

12. This Gargarism is highly commended in all dangerous Quinsies, especially in the beginning, if the enflamed Jaws be often washed therewith; Take of Saffron powdered 1 scruple and an half, of the sharpest Vinegar 1 ounce, Plantain Water 3 ounces, white Sugar 2 drachms. Mix them, and make a Gargarism.

13. Sennertus commends the Decoction of Berberry wood, or of the inner Rind of the Hazle.

14. Oil of sweet Almonds new drawn, given with Sugar, and a little of the Powder of a Boar's Tusk, is the most present Remedy for the Quinsy and Pleurisie.

Appetite, that depends upon some fault in the acid Humour, with Acids, and we see that Acids are good almost for all Diseases, but those of the Breast: Spirit of Vitriol is qualified by a mixture of Sulphur; Vinegar is good, and Oranges and Lemons; but people often take too much, and then they fall into gnawing of the Stomach, and much spitting; a little Sugar qualifies them. The season for giving them is in the state of Declination, before Dinner, not before Supper, lest when their Appetite is raised, they eat over-much, and so be not able to bear the Assault of the Disease, which is always more violent toward night, nor to digest your Food; the Seeds of Citrons and Oranges may both be eaten, because of their Cordial Virtue. The loss of Appetite, which arises from decay of strength, is seldom cured, unless that Decay come of a cold Cause; then hot and Aromatick things are proper. In old Men, that through weakness have lost their Appetite, hot things are not so good inwardly, as outwardly: For taken inwardly, in dry Bodies they create greater dryness: Outwardly Oil of Mace is good, and a Toast of Bread dipt in Malmsey Wine.

II. In all Loss of Appetite let the Food be given actually cold; and if possible, let it be set before the Patient when he is not aware of it. Let such use bread well baked, or a good while dried in the Air, or dry Cakes well fermented, and not too close.

III. When any one complains he never comes to his Meat with an Appetite, it is advisable to make him fast till he have a stomach, for starving breeds Appetite. So when a Man cannot get sleep, if he be forced to wake and nod standing, before he be suffered to ly down, he usually falls into a long and profound sleep.

IV. Want of Appetite in Women, not with Child, is cured better by Purging than Letting of Blood, for it arises of bad humours abounding in the Stomach and the whole Body. In Women with Child blood-letting is the better Cure; for it is caused by retention of blood, while they are first breeding.

V. Because Cholera dejects the Appetite by its heat, to cleanse the stomach a Decoction of Tamarinds, soure Prunes, and Sebesten, with syrup of Roses and Rheubarb, should be given: The morrow following this Medicine, two hours before Meal let them drink a draught of cold water, unless weakness of the stomach, or something else do hinder: Let them use soure Sauces, and they may take a Taste of Salt things.

VI. But if Phlegm be the Cause, after Evacuation it is best to give Acids, but with deterfive and salt things; for what sweet things are deterfive, they satiate and are flatulent; wherefore they are not good in this case, unless a great deal of Vinegar be added, so as they may scarce be perceived to be sweet.

VII. For raising the Appetite, which is often dejected in Consumptive Persons, I think there is no better Remedy known as yet, than *Elizir Proprietatis*, if 4 or 5 drops of it be taken in Wine, or some other convenient Liquor, about half an hour before Meal.

VIII. Sometimes I have known the Appetite recover of its own accord: But that falls out for the most part, either because of an exact Diet, which sometime is rightly observed even by chance, or of some notable Evacuations, or Alterations that are spontaneous: For when the noxious humours are conquered and amended, or evacuated, the usefull and necessary ones, by degrees, recover their lost strength, and then exert it.

Medicines.

I. **W**omen about sick persons desire nothing more than to remove this fault; but they reckon that which is onely a sign of Health, to be the Cause; For this reason oftentimes the Physician is forced to provoke an Appetite: It is lost, 1. Because the Powers are weakned, and the Blood is not well concocted. 2. Because for the former reason the acid Humour cannot be separated, because of the thin Humours that are admitted. (We see this in them, through whose Arteries noxious Humours, together with the acid Humour, are poured into the Stomach, which often deceives Physicians, while they ascribe the cause to the Intemperature of the Stomach) or because it is corrupted and too thin. That the loss of Appetite is to be ascribed to the fault of the acid Humour, appears from this; If the Ail be alleviated by taking Acids. Melancholick persons, who have a good stomach after the use of Acids, seldom recover. We amend the loss of

5. Balm of Peru is an excellent Remedy for this, if some drops of it be given in *Hippocras-Wine*, or some other, an hour or two before Meal.

true, he perceived the thick, but could not stop them; nor was there any other reason for this, but that the whole Muscle was cut. And, *Aquapendent*, l. 3. de ulc. c. 12. saith, We ought to cut the *Sphincter-Muscle*; yet, with caution, that we cut it not all, but that some portion of it at least always remain whole, lest the Excrements pass involuntarily: Therefore all the Muscle is not to be cut, as *Riolanus* would have it, but some small portion (though never so little) is to be saved whole, lest the constrictive Faculty be utterly lost.

Domini, de
Marche
Anst. lib. 3.

IV. *Condylomata* Swellings of the Anus, so called from their likeness to the knuckles of a Man's fingers) are irritated and grow painfull from the Afflux of the Salt and Serous parts of the blood coming from above: To take away these troubles I have experienced nothing better than to endeavour the vacuation of the Humour, by pricking them. A *Vig-neron Melancholick*, of a thin body, but tall, was frequently troubled in this nature, and found present Remedy in pricking these Tubercles with a Pen-knife.

Severinus,
Med. Eff. p.
82.

V. Many fleshy Excrecences grow about the Anus in Women and Boyes that live at Rome, which some call the *Crested Hemorrhoids*, and are accompanied with Chaps. For curing of which fleshy Excrecences, whereas several have devised several things, we, after trial of various means, have hitherto found no safer Remedy, than to clip them off: for, when they are cut off, the Sores they leave are quickly cured. But the Chaps are healed with Ointment of Lead, and other very drying things. Some cure these *Crested Hemorrhoids* with Waters made of Styptick things, as Allum, Tartar and Sublimate. Some use Goldsmith's *Aqua fortis*: But the first way of Cure is safest, seeing it brings but little pain, and almost no symptoms with it, as we have tried by long Experience.

Barbette,
Cirurgie,
cap. 9.

I. I Will propose a Way of Cure, which, at first sight, will look ridiculous, but what is of great use in the falling out of the Arse-gut. Slap the Buttocks of your Patient with your flat hand five or six times, or oftner, that the Muscles *Ante-Levatores* may immediately draw up the *Intestinum rectum* into its place: But before you thus beat your Patient, it is requisite you anoint the *Intestinum rectum* with oil of Roses and Myrtle.

Platerus.

II. In curing the falling out of the Arse-gut, you must abstain from too much Astringents, lest by making the Body Costive, and therefore causing greater straining, you rather promote than hinder the falling of it out.

III. *Riolanus*, *Anthropogr. lib. 2.* reprehends almost all modern Surgeons in curing *Fistula's*, which are very often bred in *Ano*, and pass the *Sphincter-Muscle*, and sometime go above it; for he affirms, the whole *Sphincter Muscle* may be cut, because, saith he, this Intestine cut is easily healed: for, seeing it is Fleh, it must be united. We also acknowledge it may be healed: We deny that the constrictive Faculty can be preserved; Whence it is, that the Excrements cannot be retained, as I have often observed, and especially in a Shoemaker, all whose *Sphincter-Muscle* was cut across, and then united: Yet the thin Excrements came away without his knowledge; it's

Medicines especially made use of by eminent Physicians.

1. In the falling out of the Arse-gut I always use warm Brine, and it does very well.

ralle, de A-
phonia.

The best way is presently to give a Vomit of White Vitriol, and Salt of Vitriol in a draught of warm Beer, and a little Butter.

Aphthæ, or a Thrush.

The Contents.

Its Causes and Cure. I.

Its Cure differs from the Cure of other Ulcers. II.
Medicines.

I. **E**VERY Thrush hath its Rise from an offending Acid, and indeed usually rising from the lower Parts by the Stomach and Gullet; seldom brought into the Mouth with the Spittle. Therefore a Thrush always indicates some sharp Acid doth offend in the body, to which we must have a special regard, not onely because of the Thrush in the Mouth, but because of the Acid in the body, which doth or may produce other mischief in the body, from which there is greater danger of Life, than from the Thrush, which may endanger a Man's life by straitning the Jaws, and hindring breathing and swallowing. Its Cure therefore consists in the following Particulars. 1. In correcting and amending the Acid Humours and Vapours that are brought to the Mouth, which not onely corrode its *Superficies*, but the inner Coat of the Gullet also, and produce infinite Ulcuses. 2. In the Diminution, or Expulsion of the foresaid Humours, when corrected. 3. In hindring a new production of them. 4. In clearing the Parts affected, in ripening and promoting the fall of the Thrush. 5. In cleansing and healing the Parts cleared. And although many have no regard to the Correction of the peccant Acid, because the knowledge and doctrine of sharp things among Physicians hath hitherto been confused, one onely name of Acrimony being known to them; Yet now a twofold, and indeed contrary sharp, being by me discovered, and now for some years confirmed by the Experience of several, regard must be had to the force and Mischief of each Acid, and to the best correction of it. And amongst many things which use to correct, or allay, either or both the Sharps, every thing deserves commendation in curing the Thrush, that concentrates the Spirits, and that does it gently; Amongst which are Crabs-Eyes, Pearl, Coral, White Earth, Bloud-stone, &c. which may be made choice of according to the Diversity of the Thrush, and the peccant Acids: For example; When the Mouth is not onely ulcerated, but the Tongue also chapt with extreme heat, and other

parts in like manner affected, so that the very bloud runs out; Bloud-stone and Dragons-Bloud are proper. When a Thrush comes without such driness of Tongue, Crabs-Eyes and Pearl will be the best to temper and correct the Acidity, for they gently concentrate; and what I have mentioned hitherto doe good in allwaging and destroying the noxious Acidity. *Bergarticum minerale* is also good. Medicines that purge Phlegm diminish, and carry off these humours, when they are corrected as much as can be; for all pure Acid humours are found to be like *Serum*, and no wonder if they be joynd and confounded with other humours, as Phlegm and Choler; and so it is not absurd to carry them off by Specificks. This is the reason why in curing the Thrush in Children we so frequently use Syrup of Cichory with Rhubarb; because Choler is also corrupted, and, by the very sharp Acid is made eruginous. To say nothing now, that all humours are purged by any Purgative, although I think that this or that humour is more easily and plentifully purged by some certain Medicines, than by others. The production of Acid humours, as it depends especially upon the use of Meats, Sawces and Medicines, that are Acid, as also of a cold Air, Grief, or Terroure of Mind; so this same production may be hindred, both by abstaining from such things, and by using those that are more oily, or more fat and spirituous, by the enjoyment of a more serene and warm Air, and by recreating the mind with gratefull and delightfull things. And, as the Original of Acid Vapours is owing to the effervescency, caused by a very sharp and powerfull Acid, so the vapours will be hindred, when the said vitious effervescency is corrected or hindred, both by things which concentrate the potent and exceeding sharp Acid, and by things which otherwise take off its edge. Chalk, Dragons Bloud, and the like, do powerfully concentrate a sharp Acid: Fat and oily things take off its edge, especially *Opium*, and all Narcoticks; but I prefer a Metallick, or Mineral Sulphur fixt, above all, in comparison of which, nothing I have hitherto tried does so kindly, certainly, speedily and safely restrain these vitious effervescencies. The parts affected may be cleared of the Thrush by maturation of it, and by its spontaneous Fall, promoted by Medicines, that kindly temper the Acid Acrimony, which accompanies it, and that draw the Acrimony to themselves, amongst which the juice of baked or boiled Turneps is deservedly commended with a little Sugar: Though less be needfull, when they are baked, for the juice that comes out of them then is in consistency and taste like a thin Syrup. The Patient must wash and gargle his Mouth and Throat often with this juice; or hold it a little in your Mouth and swallow it by degrees; which I prefer, because not onely the Mouth and the Parts therein contained have the benefit of it, but also the whole Gullet and the Stomach, which are not less troubled with the Thrush than the Mouth. And this should be done in Children especially, in whom we cannot expect Washing and Gargling. Besides, seeing this peccant Acid is kindly and effectually tempered by this juice, it is also corrected in the small Guts, and its ascent is hindred, and the Disease is sooner cured. Divers Syrups are also used, as solutive Syrup of Violets, Jujubes, Syrup of Liquorice, &c. which I think doe good, in that they take off the edge from the noxious Acidity by the mucilaginous juice of the Plants of which they are made: I must needs commend the yelk of an Egg mixt with a little Rosewater and Sugar, for it draws to it the Acid humour that hurts the Stomach, and so by degrees clears the part affected, and promotes the fall of the Thrush: You may use it as the Turnep juice: Some commend Beer with slit Figs boild in it: Yet I have observed it ingratefull to some, because of its great Glutinousness. While the Thrush is ripening, that is, gradually falling

Sylvius de le
Boë, Appen.
Traç. 1. c. 5.
Sect. 50. &
59.

from the Parts disaffected, a new Cuticle grows under them, and covers the Parts: And although this follow of its own accord, and by the benefit of the Medicines now commended; yet it will be promoted by the Syrup of red Roses, Honey of Roses, and the like. Also Bole Armenick, Terra Lemnia, &c. ground fine with a little Plantain Water and Sugar, may be held in ones Mouth, and the last part of the Cure, i. e. healing it, be hastened.

II. This is remarkable, that the cure of other Ulcers is promoted, when they are dried by degrees, and little Humour comes from them: On the contrary, there is hopes in a Thrush, when it is moist, and when one spits as if he were in a Flux: For then the Thrush is cured with more speed and ease. Wherefore, as in curing other Ulcers, Medicines are commended, that temper the Acid Acrimony, and then dry; so Medicines on the contrary, are good to cure the Thrush, which are gentle, and temper the Acid Acrimony; but they must also be moist.

4. Petrus Angillata Writes, how he hath cured a hundred Thrushes, with Savory boiled in Wine, to wash the Mouth. It cures the Patient in two or three days.

Rud. Gocle-
rius, Experi-
mentar. c. 15.

5. For the Thrush in Children; Take of Allum, Sugar, each half an ounce, boil them in Plantain Water, add of Mulberry juice what is sufficient, wash the Mouth often, it will doe much good.

Joel, Oper.
Med. Tom. 2.
Sect. 7.

6. The most present Remedy for the Thrush, both in young and old, is this; First wash the part well, then lay on the following Liniment. Take of Honey of Roses half an ounce, oil of Vitriol 1 drachm; mix them, make an Ointment.

Herc. Saxo-
nia. 1. 2. p.
c. 25.

7. If the Ulcers be Malignant, I use either Water of Tartar, or Vitriol, wherewith all malignant Ulcers are conquered.

River. pran.
Med. 1. 6. c.
5.

8. If there be no Inflammation, the onely and best Remedy is Spirit of Vitriol, or Sulphur, which in those that are grown may be used alone. Dip a little Cotton, bound to the end of a stick, in it, and give the Sore a light touch: for so a simple Thrush is cured in a moment.

Sennert, 1. 2.
p. 1. c. 18.

9. In Childrens Thrush this is an approved Remedy, especially when it is malignant and Epidemick; They hold a living Frog to the Child's Mouth, that it may draw out the Malignity, which when it is weary and dead, they hold another, and so on; but this is a filthy Medicine.

Medicines.

I. I Judge a Man may, nay must, according to Prudence and Art, let blood in every Apoplexy, according to the Constitution of the Patient, and quantity of blood in the Vessels, and that plentifully. For so the Patient will endure the longer, and the Apoplexy will be easilier cured, as experience testifies; without which I know not, whether upon consultation, one would not be afraid to let blood in ancient people. When therefore the Physician dare not let blood, experienced persons advise well, that Scarification should be used, or at least Cupping with Scarification, in stead of blood-letting. And because so great a Man as Sylvius relies here altogether on Experience, but remains dissatisfied in his Theory (as who pleases to consult the place cited, may see) I think it very pertinent to consider how exactly the excellent Wesper hath laid down the Theory: For, to discover so abstruse and latent Causes, he produces Anatomical Histories, or Observations, wherein the Phenomena in Bodies of several, who died of this Disease, are declared. In three that died Apoplestick, the extravasated blood was either gathered here and there into great Clods, or had discoloured the substance of the Brain all over; in another a Flood of Serum had overflowed the Brain within and without. From these marks of this most occult disease thus discovered, the Authour concludes, the places principally affected are not the large Ventricles, but the medullous substance of the Cerebrum, and the Cerebellum, which is every way porous, and furnished with narrow passages, as well that Vital Spirits may flow thither from the blood, as that the Animal may flow thence. And indeed he concludes, that the Cause of every Apoplexy wholly consists in these Two, i. e. in one alone, or both together, namely, either because the Afflux of blood, through the Arteries to the Brain is denied, or the Efflux of Animal Spirits from the Cerebrum and Cerebellum, through the Nerves and Spinal Marrow, is stopt; or for both these causes. As to the First, he proposes how the blood may be stopt three ways, i. e. First, Either by reason of the Obstruction of the inner Carotid and Vertebral Arteries, which happens in the bigger Vessels, and especially about the Ascend of the Cranium, from blood concrete into grumous Lumps; or in the lesser Vessels, which cross the Brain, from their being stopt with viscid Matter. Or Secondly, The influx of blood is kept from the Brain, by reason of the Compression of those Vessels; which sometimes happens, when the Paristhmia, or Glands of the Neck are so swelled with Serous humours, that by pressing the Arteries that pass under them, they stop the passage of the blood to the Head. Or Thirdly, The Afflux of Blood may be hindered, when a Vessel being opened within the Cranium, the blood is plentifully poured out, which should otherwise go to the benefit of the Brain. As to

Cured by Blisters. VIII.

to the other Cause of the Apoplexy, i. e. the hindring the spirits in the efflux, he reckons it is caused two ways, either by obstruction of the Origination of all the Nerves, caused by ferous Matter; or by sudden Compression of the same, which either too great gathering of blood in the *Meninges*, or in some certain parts of the Brain, or in its Ventricle, or some phlegmonous Disposition do produce. Seeing the Apoplexy, according to the opinion of the Moderns, consonant to the doctrine of *Hippocrates*, arises from the stoppage of the Circulation of the blood, or, as he speaks, from the standing of the blood; and nor, as *Galen* would have it, from the oppletion of the Ventricle of the Brain. All hope of safety consists in a speedy revulsion and retraction of the Matter from the Head; nor can there be found a Remedy, which can so speedily avert, derive, nay and evacuate the humours from the Brain, as Letting of blood; therefore we prefer it before all other means in curing the Apoplexy, and we think it proper for all Individuals, whether they be plethorick or no. The thing it self speaks, for several Apoplectick persons have been restored, and perfectly cured, onely by letting of blood. When the blood is taken from the Arm, that also in the Jugular Veins is drawn downwards, and then comes some portion of the Matter that is in the *Sinus's*, which although often it be phlegmatick; yet it is found not without blood; but may be removed and drawn back with it. And for that cause, unless some weighty reason hinder, we order large blood-letting in Apoplectick persons, which may reach the humours above, and remove them, and sometimes we repeat it twice or thrice in each Arm, that the Veins being emptied on each side, may draw down the humours more powerfully from the Jugular Veins. Nor need want of strength be much feared, which is here oppressed, not wasted. As for cooling the body, and thickning the humours, for which some reject blood-letting, it is of no moment, for in the Apoplexy, nothing is more necessary than Revulsion and Turning the Matter away from the Head, and we must especially labour to doe it presently, which Indication blood-letting quickly answers; Wherefore, we may hope for more benefit from translation of the Morbifick Cause, than we need fear damage from cooling of the Body.

II. After the universal Plenitude is abated, by letting blood in the Arm, the Parts especially affected are to be relieved, for which purpose the best means is opening the Jugular Veins, out of which, by reason of their bigness, the blood runs freely, which by stagnation oppressed the Brain; and by this discharge the Lungs are less oppressed; and when less blood comes to them, they easier deliver what they contain, to the Arteries and left Ventricle of the Heart, and the Current of the blood being render'd more free, Coagulation is hindred, Obstructions are opened, and the Animal Functions are by degrees restored. Concerning opening of them, Experience seconds Reason; and these Veins may with more ease be opened, because in this Disease, they being swelled, there is no need of Ligature, which in this case might doe harm, and therefore, after opening of them, must not be too strait, but *Emplastrum Galeni* must be applied to the Orifice.

III. When there is no *Plethora*, but great store of sharp humours, i. e. much fowre Melancholy, or its Exaltation hath caused the Apoplexy, which foregoing pains do shew, *Hippocrates* bids us use Fomentations before blood-letting, nor without reason; for when the Veins are inflamed, dried and straitened, and the blood by degrees coagulates, if we withstand these things by emollient, heating and attenuating fomentations, the blood will run more freely, and with its rapid motion will wash what was beginning to coagulate from the Capillary Vessels dilated and softened, if presently after the Fomentation, or in the very use of it a Vein be open-

ed: Otherwise, it is to be feared, the thinner part of the blood may come away by blood-letting, while the thicker, and what begins to coagulate, stays behind, which will hinder the effect of the Purge which should then be given. The Head especially should be bathed, seeing in it there is the greatest danger from Coagulation; and next the *Hypochondria*. But both Fomentations and blood-letting should be used in the beginning of the Disease, while the spirits are yet elevated.

IV. There is scarce a Practical Physician, but advises blood-letting in an Apoplexy caused by blood. But I question whether it be proper in every Apoplexy, as the excellent *Nymannus* thinks: For he, in favour of his Hypothesis, which takes every Apoplexy to be caused by Obstruction of the *Sinus's*, is very large in commendation of blood-letting; which Hypothesis, since it does not hold true in every Apoplexy, as I have proved, the like and perpetual use of blood-letting may be questioned. It's evident, when the Vertebral and Carotid Arteries are filled with fibrous bodies, that blood-letting avails little: And those Apoplectick persons are in the same Case, who have the *Torcular* stop, seeing it cannot wholly be obstructed, except by some such like body. Nor likewise will blood-letting be convenient, when *Serum* is gathered in the Ventricle, and Cavity of the Skull, since by it the immediate cause is not removed; but the strength otherwise spent, is more weakened. In an Apoplexy, where a Vessel is broke, there is no hope; both because a quantity of blood poured into the Ventricle and *Basis* of the Brain, cannot be got back by Art, and because while it stays there it is coagulated. In that which is caused by *Serum*, gathered in the substance of the Brain, what good blood-letting does, it is by accident, namely, as it abates the Turgescentcy of the blood and *Serum*. Therefore this alone will not remove the Apoplexy, but we must also use things that spend and evacuate, the *Serum*, which moistens the medullous substance. But blood-letting in an Apoplexy, caused by a sudden Obstruction of the little Arteries, is good in many respects; for first the preternatural violent motion of the blood is stop, which often is the occasion of this Obstruction; and it runs in less quantity to the Brain; for instance, when the blood is taken out of the Arm, no small portion makes to the Arm by the Axillary Veins; that so what was taken away may be supplied: Then the blood hastens from the whole body, and from the brain, towards the Heart, to assist it, thus depauperated and spoiled by blood-letting: And the heart eased of the burthen wherewith it was loaded, both before and in the Paroxysm, disperses the blood as it returns, more chearfully, in better order, and in quantity more usefull to the brain, which forceth and washeth out what caused the Obstruction and Trouble in the medullous substance, and drives it into the Capillary Veins adjoining to the extremities of the Arteries.

V. Blood abounding in the head cast a full-bodied young man into an Apoplexy, with Trembling, loss of Speech and Ratling, three most dangerous concomitants of this Disease. Wherefore speedily to abate these violent Symptoms, he was immediately bled in the right Arm, but not bleeding so freely as his extremity required, the same Lancet was used to his left Arm, and when both had continued bleeding for some time, his Ratling evidently abated, he took his breath better, and quickly was cured.

VI. Cupping with Scarification should be applied, not to the shoulders and back, as the *Arabians* advise; because there is no remarkable Vein that reaches the Brain: But they should be stuck near the Jugulars, and under the chin, if possible. For these Topick Remedies should be applied, not onely upon the Veins that reach the part diseased, but upon the next and largest, if the constitution of the Part will permit it.

Wepferus, Exercitat. de Apoplexia, p. 213.

Tulpius, c. 7. lib. 1. Observat.

Redacted.

VII. A large Cupping-glass may well be applied to the top of the Head, seeing it draws the blood out of the *Sinus* of the *Dura Mater*, opens Obstructions, and raises the subsiding Brain. With which opportune Remedy *Pracasterius* remembered how he had once cured a Nun, at that very time when he himself being seized with a small Apoplexy, made signs by putting his hand to his Crown, that he would have the like remedy applied; but they that were by not understanding him, and his Disease increasing, about night he died.

Horsius, in
Probl.

VIII. A Man of Threescore fell down drunk, and confused the hind part of his head, but his Skull was whole, and he was taken with a true and violent Apoplexy. While all despaired, I tried to cure him; I shake him violently, I give him a sharp Clyster, and make it work with a sharp Suppository, there was plentiful Evacuation. When his head was shaved all over, I applied a Cataplasim of Pigeon's Dung, *Euphorbium*, *Pyrethrum*, and Mustard; hereupon many and great Blisters arise, out of which yellow matter ran. The next day I gave him of *Species Hiera Diacolocynthidos* 2 drachms, of Castor half a drachm, of Rue one scruple, with Antapoplectick Water: I applied Cupping with Scarification to his Shoulders; when the Blisters in his head ran no more, I raised new ones in his Neck, and thereabout, but onely with Cupping-Glasses: And with some few more Remedies he recovered his health.

Heers Obser-
vat. 21.

IX. *Forseus* lib. 19. *Observat.* 74. condemns shaking of the body in Phlegmatick and Sanguine Apoplexies, and because the humours are thereby more stirred, he advises to use it with caution. Which not being observed in old *Bokellus*, b. c. the Imprudence of the Physician cost the Patient his life. *Nymanus*, in Chap. 39. of the Apoplexy, mentions a Patient, that had his end hastened by such unseasonable shaking. The shaking of the Womans body, mentioned by *Forseus*, as the Ail appeared, without using any thing before it, quickly cured her; which, in others, if it had not caused Death, it would at least have done hurt, and exasperated the Disease. But this shaking, and causing her to walk, seems therefore to have done good, because by shaking her body her blood was stirred, which being provoked to more violent motion, forced that little, which caused the Obstruction already, and would have caused more, out of the lesser Arteries, and drove it farther into the small Veins; whereupon some portion of it, i.e. the more subtil, and the matter of the Animal spirits, was able to sweat through the Pores into the Substance of the Brain, and she at the first was able to walk again. Upon her walking more plenty of Vital Spirits succeeded, while Nature used her utmost endeavour, being excited by stirring, to supply the Medullous Substances; and her blood being not a little heated and made more subtil by walking, it could more readily pass the Capillaries, and the Pores. But if the Paroxysm had had its original from the Serous Moisture poured into the substance of the Brain, it had not ceased so soon, and there had been other symptoms, as Sleepiness, *Vertigo*, &c. Nay, by walking, being farther driven into the Medulla, it would have bred a Palsie. In any Apoplexy likewise, bred of any other cause, it would hardly have done so much good. For either if it be caused by the Carotid and Vertebral Arteries being stoppt, or by the *Torcular* being stoppt by pituitous Bodies, or by extravasated blood, in any of these cases more powerfull Remedies are necessary.

Wepferus
Exercitat. de
Apoplexia.

X. I cannot chuse but examine, as I have occasion, some sort of Remedies, commended by some, namely, whether they avail any thing in the Cure of the Apoplexy, or no. And in the first place plucking the Hair, especially in the Legs, is commended, which, when the Patient wants sense, seems to me plainly ridiculous, for it conduces nothing to the removing any one cause of the Apoplexy; Bending the Fingers, and Twitching the Nose is of the same

nature, nor do I see what good they can doe. And shaking the body, unless the head hang downwards, that so the humours offending may run out, will contribute nothing but evident Damage to the Patient. So rubbing the extreme Parts with Vinegar and Salt, and Ligatures, will doe no good in any Apoplexy. It is better therefore to abstain from such things, as have no use, nor doe the Patient any good.

Sylvius de
le Boe. l. c.

XI. Some question Purging for two reasons. 1. Because Purges may not be given so long as there is crudity, according to *Hippocrates* and *Galen's* Maxims. But without doubt, Crudity, properly so called, which might hinder Purging, is wanting here; yet if there be any suspicion of a thick Humour, Attenuatives may be mixt with Purgers, for the greatness of the Disease, and the Imminence of the present Danger will not allow a Man wholly to intend the Preparation of Humours. 2. The way whereby Purgers should get into the Belly hinders Purging, when one has not power to swallow without fear of choking; Therefore a strong Medicine in a little Dose may be given, as *Trochisci Albandal*, *Diagridium*, or Scammony with Castor, according to *Trallianus*; *Rondeletius* gives a drachm of *Pilula Cochiae* dissolved, according to *Sennertius*. Seeing the chief cause of the Apoplexy is Melancholy offending in quality, i.e. in excess of Acidity, or Acerbity, it is evident that the Humour, seeing it is preternatural, doth indicate its own Evacuation, and the rather, because of the present danger; nor can there be, even in a long time an alteration from Acidity to a more benign and spirituous, or Balsamick nature. And much more yet is Purgation indicated, if a Phlegmatick be joyn'd with the Melancholick *Cacochymie*. Nor doth Purgation allow any longer delay after blood-letting, when the Plethory is taken from the whole, or from the head, than blood-letting allows after the invasion of the Apoplexy, unless extreme faintness require time to recruit. Wherefore Purging is to be prescribed quickly without any respect to time: for unless while the blood is made more fluid by Venesection, and the obstructions of the Brain and Lungs are in some measure removed, or the Increase of them stoppt, and while the Spirits are yet elevated, a Purge be given, when the Coagulation of the blood is sensibly increased, the Cohesion of the Parts of the blood, and of the humours mixt with it, among themselves may be so pertinacious, as to bid defiance to all the virtue of Purgatives; Nay, the distribution of the Purgative, especially to the Parts affected, may be prohibited, if not wholly, at least in part, while the Passages are straitned by Coagulation of the Blood.

Franc. Bay-
le, Traict. de
Apoplexia
c. 11.

XII. Nor may every Medicine be given, but a violent one, such as the nature of the peccant humour, the disposition of the blood, and the place it self do indicate. To the first *Aphor.* 9. *Secl.* 4. hath respect, You must purge Melancholick persons violently by Siege; for Melancholy will not stir, except it be forced from the other humours by a strong Drench. But the Coagulated blood, or next door to Coagulation, parts not easily with what it contains; but stands in need of a strong Ferment to make it boil, and endure a separation of parts. And seeing the humour to be removed is not in the Stomach, and first ways; but in the whole Mass of blood, and in the Brain especially, it is necessary that the virtue of the Purgative be diffused all the Body over, and reach the Head in its full force, to which a weak Purgative can never attain.

Idem.

XIII. It often happens that the Faculties are so oppressed, that Purgatives cannot be brought into Act, and so operate nothing at all, which is an ill sign, and such persons usually die. But because, according to *Celsus*, Many things may well be done in a dangerous case, which should otherwise be omitted; therefore, when the foresaid Remedies avail not, we may come up to Antimonial Medicines, especially those that are

are less violent, such as *Aqua Benedicta*, made of *Crocus Metallorum*, which Purging both upwards and downwards, brings away so great a quantity of Phlegm, not onely from the Stomach and lower parts, but from the Brain, that sometime the Patient is cured by this Evacuation; For I can truly testify, that I saw a Nobleman cured of an Apoplexy thrice in two years by this onely Remedy. And although some condemn the use of Vomits in these cases; yet we must rather trust experience, which teaches us by daily experiments, how comatous Children are with more speed and safety cured by Vomitive Salt of Vitriol, than by any other Remedy.

Riverius.

Francisc.
Bayle, Traſſ.
de Apo-
plexia, c. 11.

XIV. Here I must take notice of a frequent Error in giving the Emetick Wine: For timorous Physicians prescribe it in too small a Dose, i. e. an ounce, or an ounce and half at most: and when they are frustrated of the effect expected, they blame and disparage the Medicine; whereas, to persons grown, and of any strength, it should be given to about three ounces in an Infusion of *Senna*.

XV. *Waleus* saith, that in the Apoplexy Clysters may be so strong of *Coloquintida*, that they fetch the very blood. Nothing hinders it, for Life must be saved, and this Damage may easily be repaired: And it may the better be done, if the Apoplexy were caused by too much blood.

XVI. The Belly, for Revulsion sake, and to excite the dull Faculties, may be provoked by administering sharp Clysters and Suppositories, whereas otherwise they would scarce go to stool. Suppositories, because they provoke exceedingly, and are quickly made, and by reason Clysters cannot be kept for Senselessness, are very convenient, and should often be repeated; in which some burning hot things, since the Patient is without Sense, will doe no harm.

Platerus.

XVII. Some rub *Hiera* and Purging Electuaries on the Palate, to no purpose, in stead whereof it were better to use *Confectio Anacardina*, which inflames a little.

Idem.

XVIII. We rub the Palate with things that bring away Phlegm; yet in that Quantity and Form, that if they should fall on the *Aspera Arteria*, they may not choak. Take of Mustard-seed, long-Pepper, Pellitory of Spain powdered a like quantity, mix them with as much Honey, juice of Rue, and Horseradish, as is sufficient to makethem into the form of an Ointment. We leave out the Vinegar, which some put in, because it abates the strength of sharp things, as we see in Onions and Horseradish, if they be eaten with Vinegar.

Idem.

XIX. Although the humour causing the Apoplexy cannot be cast out by Sneezing, because it is not contained in the Ventricles, yet in this most grievous and dangerous case, we must try every thing, that may remove the Matter. However, before Purging, it is suspicious, because by the motion of the Head and Breast there is a greater afflux of humours. We may anoint the Nostrils with the same we anoint the Palate withall.

Platerus.

XX. Some provide Fumigations, but they are not at all to be commended, for they are dangerous to those that have difficulty of Breathing: It is better to hold a little Rue, or Castor, or *Galbanum* to the Nostrils. Some highly approve a Fume of Amber made immediately; how destitute such are of Reason, learned Physicians can abundantly shew.

Bondeletius.

Crato.

XXI. Things taken inwardly are not to be neglected in the very beginning, which encrease the Effervescency of the Blood, refresh the Spirits, and raise the deficient Heart, in Plethorick persons especially after blood-letting, in others both before and after: The most spirituous, and which abound with volatile Salt, are best; Such as are several sorts of Apoplectick Waters, Spirit of Wine Tartarified, distilled Oils of Anniseed, Rosemary, Sage, Cloves, and the like, with some Cephalick Water. Volatile Salts especially bring great and present benefit, that

are separated and cleansed from all concretion of their Body, such as are the volatile Salts of *Sal Ammoniac*, Soot, Blood, Hartshorn, and (which exceeds them all) the volatile Salt of Vipers. These Salts quickly pass through the whole Mass of Blood, and render it more fluid, they infringe the force of Acids, and dissolve grumous blood.

Bay. Traſſ.
de Apoplexia

XXII. There are some who give Treacle or Mithridate to drink, but under a great mistake, because all the virtue of the *Opium* will not be lost, though they be never so old. To say nothing of the many Astringents are in them, the strength whereof, although it be qualified, may be suspected; because the humour, that is the cause of the Disease, and moistens the body of the brain, is more deeply impacted by these Medicines. It is better to give a Scruple or two of Castor, which, because of its unpleasantness, less hurts the brain.

XXIII. When a continual Fever (for one Intermittent presages Death) accompanies the Apoplexy, as it should do, it needs no other help. If it be too low, it increases the Disease; if too high, it spends a Man. For a Fever cures no other Apoplexy, than that which comes of cooling the blood, of crude humours, and a flatulent spirit. But here the Prudence of the Physician present is required.

Crato in
Conſil.

XXIV. One taken with an Apoplexy was raised by rubbing and Motion; a Fever followed, gentle enough, but with a *Delirium*. Being negligently cured, and not raising what fell upon his Lungs, he died the ninth day after his Fever, and the tenth after his Apoplexy.

Hollerius,
lib. curat.
Sc. 29.

XXV. The question is, about the Posture of the Patient, namely, Whether he must presently be put to bed, or be kept up a while: Some very carefully observe the latter, nor without reason, because certainly there will be a greater propensity to sleep in bed, and the blood by the heat of the Clothes will be in a greater ferment, and the more it blazes, the more recementitious matter it discharges into the diseased Brain: On the contrary, while the Patient is thin clad, and set in a Chair, the blood runs slower, and while the Vessels subside, they seem fitter to receive the humours from the Head, than to send more thither. Wherefore, if the Patient have strength sufficient, perhaps it were better to sit up six or eight hours, till the flux of the morbid matter be past, and the course of the blood be made more sedate, by letting of blood, and by other remedies carefully administered. But such as are weak, and of a tender Constitution, must, as soon as they are seized, be laid on a bed, either in it, or upon it. His posture must be not on his back, but with his head a little raised, and turned sometime on one side, sometime on the other.

Willis, de
Apoplexia

XXVI. They that are stricken immediately with a deprivation of Pulse, and Respiration, and a little after, when they are cold, seem to have breathed their last, must not presently be laid out, and left destitute of the help of Physick. Moreover, were there no hope of life at all, they should not be buried for three or four days: Because such, sometime, either of themselves, or by the use of Remedies, come to life again: Which certainly comes to pass, not because the Vital Heat is kindled afresh in the Heart (for it was never quite out) but inasmuch as the morbid matter being dissolved, or evaporated from the *Cerebellum*, the motion of the Heart, as that of a Clock, when the Weights are hung on, is set on foot again.

Idem.

Medicines especially made use of by eminent Physicians.

1. The Salt of Elder is highly commended for preservation from the Apoplexy, if it be mixt with a third part of the volatile Salt of Amber, and every new and full Moon be given,

from

Martinus Blackwitiu
snar. Sam.
luci. Selt. 3.
p. 5. de
poplexia.

dorus de Bry
introduit. in
vital. Philo-
soph. tract. 2.
de causis &
curatione
morborum, c.
de gutta.

from one scruple to half a drachm in some convenient Liqueur. Also the distilled Spirit of Elder Berries will doe much good, if a Spoonfull of it be taken once a week, at each quarter of the Moon, with a little white bread and Sugar.

2. The Solution or Oil of Pearl is a Secret in the Apoplexy; if one have lost his Speech, drop five or six drops on his tongue, and he will recover his Speech.

3. Decoction of Sarsaparilla is a divine Remedy in preservation from the Apoplexy: for its detensive, cutting and opening, and strengthens the inner parts of the head especially. It may be thus prepared: take of Sarsaparilla cut, two ounces, of Primrose and Lilly Conval Flowers, of each an handfull, Fen- nil Seeds six drachms. Steep them four and twenty hours in two quarts of Water, and boil half away, when it is almost boiled, put in of Agallochum three scruples and an half: Strain it and keep it for use. The dose is five or six ounces in a morning with a drachm and an half of Cinnamon Water; let the Patient sweat, but not so as to weaken him much.

4. Having had singular Experience of these Pills, in preserving from the Apoplexy, I advise the use of them, whereof I give a scruple at night every time the Moon is at change and full, even in Summer. Take of Cubebs, Calamint, Mastich, Nutmeg, Cloves, each a drachm, Amber-grife half a drachm, Musk six grains; with juice of Marjoram, let them be made into Pills.

5. Let him that is subject to the Apoplexy hold a piece of roasted Nutmeg frequently in his Mouth. For this corrects the cold temperament of the Brain.

6. The use of Caraway seeds not onely eaten, but smelled to, is highly commended. Also the following Powder is very good for Preservation. Take of the Roots of *Siseli Creticum*, one drachm, of the Seeds of Rocket, Cardamome, White Pepper, each two scruples, mix them and make a Powder. Let him take to the quantity of a Bean, or mix it with syrrip of Betony. It is good to snuff into the Nostrils. Marjoram Water, which hath had beaten, Rocket-seed, and a little Ginger steeped in it.

7. You may preserve your self from the Apoplexy, if once a Month you take of *Hiera Hermetis* three drachms and an half, and thrice a week a drachm of Mithridate, except in Dog-days. The *Hiera* must be taken in the morning fasting, and the Mithridate at Bed time.

8. This Powder is good to preserve from the Apoplexy. Take of White Amber prepared three drachms, of Peony Root, *Species Diarrhodon Abbatis*, each half a drachm; Mix them and make a Powder. The Dose is a drachm every month, next day after the change of the Moon, in a little *Aqua Vitæ*. The use of it must be continued, and so at length the Body will be freed from the Apoplexy, and from several other Symptomes.

9. A Powder made of a like quantity of White Amber, and *Species Diarrhodon Abbatis*, given to a Scruple in Betony, or Black-Cherry water, is deservedly esteemed as a peculiar Remedy in the Apoplexy and Stone.

10. This Balsame bears the bell from all the rest; Take of Oil of Nutmeg by expression one ounce, *Species Diambra* one drachm, of Hare's Pasterns half a drachm, infuse them in a sufficient quantity of Oil of Castor for two days; when you have strained it, add Oil of Cloves, Cinnamon, Lavender, Marjoram, Cummin, Amber, each one Scruple, of Musk and Amber-grife, each half a scruple, mix them, and make a Balsame, shave the head, and apply it.

11. This Ointment of *Villanovanus* is of admirable use; Take of Galbanum half a pound, of Gum Ivy half an ounce, mix them, and distill them by an Alembick, take the Oil and Water and mix them with an ounce of Oil of Brick, and a pound of Turpentine; distill them again, separate the Oil from the Water, and keep the Oil for an Ointment.

12. *Claudius Deodate*, *panthei hygiast. lib. 3. cap. 21. de*

Specifica particul. morb. curatione, p. m. 127. Apoplexia fere gutta; highly commends the Semilunar Stone, found above the eyes of a Carp. And, *Johannes Vincentius Finckius, enchirid. Dogmatico Hermet. cap. 6. de Apoplexia*, tells us, This Stone was a Noble Womans Secret, whereby she cured several of the Apoplexy, of that especially which seized the Patient with the motion and contraction of the Muscles above the Eyes, by giving some of them in *Aqua florum Tiliæ*.

13. A most secret and certain remedy against the Apoplexy. Take of Lion's Dung powdered two pounds, pour Spirit of Wine, till it be covered three fingers breadth, let them stand in a Viol stoped three days. Strain it, and keep it for use. Then take a Crow not quire penfeathered, and a young Turtle, burn them apart in an Oven, powder them, pour on the above-said Spirit of Wine, let them stand in Infusion three days. Then take of the Berries of the Linden tree an ounce and an half, of Peony seeds powdered one ounce and half. Let them be steeped in the foresaid Spirit, then add as much of the best Wine, and six ounces of Sugar-Candy, boil them in a Pot till the Sugar be melted. Put it up. Let the Patient take a spoonfull of it in Wine often in a day for a whole Month. In the Paroxysm give a spoonfull, with *Aqua Tiliæ*, and with the same Water rub the Forehead, Neck, Temples and Nostrils. The Arch-Dutcheffs of Austria had frequent experience of the Virtue of this Medicine.

14. Take Oil of Cinnamon, Cloves and Lavender; if you know how to change them into Volatile Salt, you have got as effectual a Remedy, as can be expected from these Simples in an inveterate Vertigo, 778. Palpitation, Apoplexy, and such cases.

15. The following *Aqua Vitæ*, or Quintessence preserves a Man from, yea cures him of the Apoplexy, if a spoonfull of it be taken every morning. Take of Conserve of Rosemary Flowers, Lavender, each two ounces, of Balm, Sage, each one ounce, of *Species Diamoschi dulcis*, *Diambra*, each two drachms, of the Root of Peony, the Seed of the same, of Cinnamon, each half an ounce, of Saffron a drachm, of Castor, Rocket Seed, each two drachms, of Sugar Candy half an ounce, of Juniper Water distilled four pounds, bruise them and mix them, let them stand infused in the Sun, or some warm place for a Month, distill it in Ashes, let the dry Matter be taken out of the Glass, and pounded, and let the distilled Water be poured on it again, let them stand in a warm Infusion fourteen days, and then distill them in *Balneo Mariæ*.

16. I gave a Noble Apopleck Woman, who could not speak for three days, Spirit of Black Cherries, and she presently recovered her Voice. *Mr. Thomas Kessler tractatu. German. 200 process. chim. process. 33.*

17. Essence of Amber, with Apopleck Water, is a most excellent Remedy for an Apoplexy.

18. Tincture, or Essence of the Amethyst, is both an excellent Preservative and Cure. The Dose is to fifteen drops.

19. Take of Flowers of the Linden-tree, and Lilly of the Valley as much as you please, Bay-berries two ounces, beat them all well together, till they be in a kind of Mass: Then take some juice of Violets mixt with Sugar, pour it on the Mass, mix them well, and strain the juice hard out. Take this, and half as much Salt of Wormwood dissolved into Liqueur. Distill it by a Retort, receive the liquor that comes over, drive it through a Retort again, and then bring it over an Alembick, that there may be no Phlegm, and you will have a most excellent Spirit, of which you may give half a spoonfull, with a little Cinnamon, or Linden-Flower Water, to an Apopleck person. It gives present help, and preserves a Man his whole Life from the Apoplexy.

20. For the Apoplexy. Take of the best *Aqua Vitæ* one Pint, of Juniper Berries two handfulls, bruise 83.

Franciscus Hildtheim, *Spicilegio*, 6. p. 536.

Phil. Muller. *mirac. chim. lib. 5. p. m.*

bruise them, and Infuse them in the *Aqua Vite* for three days; strain it out, and put into it of Sage, Pennyrial, Cresses, Saffron, each one drachm; give a little to the Patient, and he will presently recover his Speech.

20. *Felix Platerus tract. de function. les. cap. 2.* faith, That Chymists give the Extract of Sage in Apoplexies as a great Secret.

Job. Popp.
Tract. de Fe-
bribus malig-
nis, c. 3. de
Apoplex.

21. A sure secret for the Apoplexy, and loss of Speech. Take of Oil of White Amber seven grains, of Ambergrise and Musk each eight grains, of the Water of Lavender, Betony, each half an ounce, of the Water of Marjoram one ounce, mix them and make a Liquor, which, when taken, the Speech will be restored.

22. The following Water is of admirable Virtue, in comforting the Brain and Nerves. It powerfully helps the Memory, sharpens the Wit, strengthens the Judgment. Whether it be taken inwardly, or the Part affected be chafed with it, it doeth much good. Every Dose may be exalted with some grains of Magistery of Pearl, or Specifick of Antimony. Take of the Leaves of Sage, with the Tops and Flowers of Marjoram, Lily Conval, Balm, Hyssop, Lavender, each two handfulls, of Rosemary, Vervain, each half an handfull, of the Root of Leopards-bane one ounce, of Nutmeg, Galangale, Cinnamon, each one ounce, of Bayberries, Juniperberries, each three ounces, of Herb Paris one ounce, of Caraway-Seeds, Cubebs, Cardamome, each half an ounce, of Whitewine as much as is sufficient. Let them be well bruised and Infused for some days, or let them stand fourteen days in Horsedung. Then distill it in *Balneo Marie*.

p. m. 665. de
Apoplexia.

23. *Confectio Anacardina*, as it is proper in all cold diseases of the Brain, so in this especially, given either alone (if the Patient come to himself, and can take solid Medicines) or dissolved in *Aqua Vite*. Also distilled Oil of Nutmegs, if dropt into the Nostrils and Ears, and the Palate be rubbed with it, is highly commended.

24. A Mineral Antapoplectical Water. Take of Creme of Tartar one pound, of the Mineral of Antimony a pound and an half. Let the Acid Spirit be distilled, by a Retort, with a moderate fire, which let be rectified. Take of this six ounces, add thereto of Spirit of Venus made of Verdigrisee, three ounces, of the burning spirit of Saturn, distilled from his Sugar, an ounce and half, of the volatile sulphureous Vitriol, rectified by the acid spirit, four ounces. Mix them for use. It is an excellent tart Water, much to be desired in all Apoplectick, Epileptick, and Soporose cases. It may safely be given to Children in Fits, from one drachm to two in some gratefull Vehicle.

Appetentia nimia, depravata.

Or,

The Appetite too great and depraved.

The Contents.

We must not use too much fat things in allaying it. I.

Narcoticks must be used cautiously. II.

A depraved Appetite cured by Sweat. III.

By Volatile Salts. IV.

By running of the Hemorrhoids. V.

Medicines.

I. **F**at and clammy things stay too great hunger: yet they are more proper in the beginning, when we would provoke Vomit: but when the Vomit becomes violent, they must be omitted. We must also have a care lest we use them over-much,

and the Patient be brought into a contrary condition; therefore, when the Patient begins to mend, Sennettus. Fat things, and which hinder concoction, must be omitted.

II. But Narcoticks are to be used with caution, and strong ones avoided, as the Infusion of Mad Nightshade made in Wine, which immediately destroys all appetite of Food in the most voracious person. Yet strong Wine and Brandy may be used, which, according to *Platerus*, take away hunger, not so much by heating, as stupifying: As Treacle and Mithridate by the same narcotick quality, he thinks, do take away the dog-like Appetite.

Item.

III. It is good in the depraved Appetite, sometimes to cause a gentle Sweat. But we must have a care that the Patient be not stifled with Clothes; for it were better not to sweat at all, than too violently; seeing that Sudorifics mend and correct the bad humours, though they expell them not. And I still prefer liquid and spirituous things before gross ones, though Antimonial, how dry soever, are excellent in this case, to wit, *Antimonium Diaphoreticum*, *Bezoarticum minerale*, &c.

Fr. Solvius
de le Boë,
Tract. l. 1. c. 2.

IV. Seeing a depraved Appetite differs, according to the diversity of the thing craved, I will here propound its Cure onely in general, which consists in cleansing the Blood, and other humours, by amendment whereof, the *Pica* ceases of it self. I have by experience found, that Volatile Salts doe more good than all other Medicines I have yet tried, because they provoke the *Menses* gently and kindly. The suppression whereof is often the cause of the *Pica*.

Idem. Præ-
lib. 1. c. 2.

V. A Man troubled with the Itch, had also the longing Disease for three Months. He had the Hemorrhoids, and within two days the Disease left him: For the matter residing in the Veins affected the Nerves of the Stomach, which once removed, the party was eased of that trouble. Whence it is clear, that in this Disease the matter doth not always stick in the Nerves.

Rhodius,
Centur. 2.
Obs. 57.

Medicines especially made use of by eminent Physicians for Excess of Appetite.

1. Take of *Hiera simplex Galeni* one Scruple, of Rhu- Petr. Forest, barb well powdered a Scruple and half, with Syrup of lib. 18. Obs. 8. Roses solutive, make it into Pills, N^o xv. I have cured several of this Disease, with these Pills onely taken for some time.

2. The Philosophick Spirit of Vitriol divers times Hartmannus given in Pomegranate-Wine, Syrup of Lemons, or Tract. Chron. a. r. p. 100. Tincture of Roses, cures most perfectly.

3. If in a Boulimy one be troubled with Fainting, it is good presently to give him Bread sopped in Wine. Senn. de Boulim.

4. Antiquity found not a more present Remedy Weikardus for this eating Evil, than Bread and the smell thereof. Theaur. Pharm. l. 1. c. 11.

For the Appetite depraved.

5. I know, that to give a Drachm and half of the Hor. Aug. 3. Powder of the Seed of Ammi, four days one after another, doth admirably help a depraved Appetite, for the Women are either cured, or much better by it. Ejist. Conf. p. 425.

6. These two things have great Efficacy in the Jul. Cels. Claud. in longing Disease. (1.) Take of Walnut Buds four Empirica. Ounces, Aloe Socotrina one Ounce, Juice of Agrimonia half an Ounce, Frankincense one Drachm, Ration. p. 238. Scoinanthe two Drachms. Mash them together, boil them in water till the water be almost boiled away. Then strain it, and to what is strained out, put as much Honey, give one Drachm of this every other day. (2.) Take of Mustard-Seed half a Scruple, of Pigeons Bones burnt to ashes one Drachm and a half, Seed of Purslane one Drachm, Cinnamon two Scruples,

Scruples, Juice of Quinces two Ounces, White Sugar three Ounces. Mix them in a double Vessel over the fire.

David Her. lic. de cur. gravid. c. 16. 7. This is very good. Take in the Month of May the first white Buds of the Vine, bruise them and distill them by an Alembick. Let a Woman with Child drink a little of this for three or four days; and it will neither hurt the Child, nor give it any Mark, though she should not get what she longed for.

Jacob. Hol. Ier. Inf. Chir. p. 49. 8. A Decoction of the greater Chamæmil, that is very like Southernwood, will be of great use in this case: for it surpasses all other sorts of Remedies.

Mercurial, de morb. Mul. p. 33. 9. If Women labour under a depraved Appetite, Egineta commends the use of old and odoriferous Wine, the Water of Shepherd's Rod, especially drunk after Meals: also Dill infused in Wine.

Schroderus: 10. Sowre Pomegranates are good for the Pica in Women with Child. The Leaves of the Vine are also good.

Trotula de Regimin. Pregnant. p. 101. 11. If a Woman with Child long, give her Beans with Sugar.

Remedies must be used constantly. XXXIX.

A Milk Diet good, if it can be continued in. XL.

Medicines.

The sum of William ten Rhyne's M.D. Treatise of the Gout.

I. Hippocrates l. de Affect. Sect. 3. lays down the peculiar signs of the running Gout. 1. Pains of the Joints, with remarkable heat, not in them only, but the whole Body over, insomuch, that men seem plainly to be in a Fever. 2. The nature of the Pains, which at the very first invasion are presently acute, although sometimes they are more moderate. 3. The running of the Pains from one Joint to another. The essence of the running Gout consists in these Three things, which distinguish it from the Gout: for in this the heat is not so evidently perceived at the first, as in the running Gout, nor till the corrupt Humour in the Veins be transmitted to the out-parts. And the reason of this difference arises hence; because in the Gout the Disease is in the little Veins, and the inner parts; in the running Gout it lies outwardly, and nearer the skin. 2. In the Gout, the Pains at least in the beginning are not so sharp, and that by reason of the Matter, which, in the running Gout is thinner and sharper; which diversity of Matter indeed may be one cause, why the pain in the running Gout is accompanied with greater heat, than in the Gout it self. And therefore the running Gout is reckoned among acute Diseases: but the Gout among the Chronical, l. 1. de morbis, where there is no mention made of the Running Gout, it being an acute, not a chronical Disease. And then the running of the Pain from one Joint to another distinguishes them: For although the Gout pains pass from one Joint to another, they doe it gradually, and not so suddenly as in the Running Gout, in which, when the pain is at the height, it presently ceases, and takes another joint. Hippocrates saith, that Choler and Phlegm when they are moved and settle upon the joints, are causes of the running Gout. Where observe, that these Humours come not from any particular part of the Body, but from the whole: And in this lies the difference, the morbidick matter of the Gout comes not from the whole, but is cast off by some Principal Part to the Joints. And this is the chief reason why the Gout is a far more grievous Disease than the running Gout, and harder to Cure; and why the running Gout is sometime perfectly cured, and never comes again, which the Gout generally does. For whatever Hipp. l. de Diseases pass from a stronger part to a weaker are difficultly cur'd. Since therefore the Gout is of this nature, no wonder if its Cure be difficult; and the rather, because it is not easie to find what is the original of it, the Brain, or Liver, or what other noble Part; which being unknown, it is utterly impossible to cure the Gout, seeing the Part which sends the Humour should first be cured. Therefore, to the breeding of the Gout there concurs, 1. The fault of some Principal Part, which breeds, gathers and disposes of the morbidick matter. 2. The disposition of the joints to receive the Flux, i. e. a certain weakness, which when there is none, there is no Gout; but Diseases much of the same nature, and returning at certain times, as the Colick, Epilepsie, Asthma, Vertigo, Head-ach, especially the Stone in the Kidneys. Another difference of these two diseases, in respect of their material cause, is, that onely Choler and Phlegm concur to the breeding of the running Gout; but Hippocrates saith of the Gout, And indeed this is a disease of the Blood in the small veins, corrupted by Phlegm and Choler. Whence we may gather, that Bile and Choler are carried from some part principally affected, by the Veins to the Joints; where, if they find the Blood in the little Veins disposed to corruption, they corrupt it, and cause pain: If not, they use not to cause pain, because the Vessels do contain them; and unless there be distension, or the Humours be extravasated,

travaſated, there can be no ſolution of Continuity, which is the proximate cauſe of pain. *Hippocrates* treating of the Cure of them both, ſaith, *And the ſame things are good for this, which are good for the running Gout.* And the reaſon of their Convenience is, becauſe all of them have reſpect to the material Cauſe, i. e. Choler and Phlegm, which fall upon the Joints. But treating of the Gout he ſubjoyns; *But if the Pain abide in the fingers, burn the Veins a little above the Knuckles, and you muſt burn them with raw flax.* He propounds not this Remedy in the running Gout, both becauſe the

P. Martianus
comm. in. cit.
loc. p. 170.

remainder of its pains are not of any continuance, and becauſe it lies not ſo deep as the Gout; as alſo becauſe the continuance of the Pain argues great weakneſs of the Joint, which cannot be better helped than by burning, and it may alter the bad diſpoſition of the part, whereby the blood therein contained is diſpoſed to corruption, in which the Eſſence of the Gout ſeems to conſiſt.

Sennertus,
Epist. 1. cent.
1.

II. We muſt rather take care of the Part that ſends the Humour, leſt it breed more, than think of outward Applications. All the ſtreſs of Precaution lies in this, in hindring the breeding of Serum, and the Ebullition of Humours. *Crato in Epist. 52.* hath theſe words; *I think the whole of Precaution conſiſts in a right courſe of Diet and Abſtinence; alſo in waſhing the Head and Sweating.*

III. That efficacious Remedies are required to cure the Gout, theſe following examples of perſons cured do ſhew. A Turk at *Conſtantinople* (as an ocular and credible witneſs, *Mr. Arlaud* a Watchmaker of *Geneva* told me) who had a confirmed Gout, received, according to the Cuſtome of that People, five and twenty blows with a Cane upon the Soles of his Feet, as a Punishment for ſome Fault; he was deprived of the uſe of his Feet for ſome days, but he lived afterwards free from the Gout. Alteration of Diet is of great efficacy in this caſe. *Mr. Franchet* of *Pontarlier* in *Burgundy*, a Man well known to moſt, and to me formerly, who was baniſhed his Countrey by an inrode of the *Swedes*, *An. 1636.* into *Burgundy*; having loſt all, was forced to get his living by carrying a Panier at his back to Markets and Fairs; and by this courſe of life he lived afterwards free from the Gout.

IV. The Patient was an Inn-keeper, the Phyſician was a certain Noble Knight, who bargained with his Hoſt to Cure him of the Gout for 300 Florens, and having received a Bill under his hand, he undertook the Cure. The Patient was commanded to ſet his Feet upon a Block of Wood. The Knight had his Servants, who were ſtout Fellows, by, to hold him down, as he ſate; The Knight himſelf with a Hammer, and ſix Nails, nailed his Feet to the Block; he left his Patient crying out moſt miſerably, and took Horſe. In the mean time he made Inquiry, whether the Gout came again, and after three years, when he underſtood it was not come, he returned to the Inn, and joking with his Landlord, Asked him, If he was Cured of the Gout? then he produced the Bill under his Hand, and demanded his Fee: His Landlord, though cruelly handled, agreed to it. The Knight indeed tarried ſo long with him, till he and his Servants had ſpent the 300 Florens.

Doringius,
Cent. 2. Epist. 46.

V. *Lewis Noel* a Surgeon of *Geneva*, Sworn Searcher of the Dead, who died almoſt Ninety years old, *Anno 1678.* had been long afflicted with the Gout. When he was laid up of a Fit, a Woman that was a Natural, called *le Maistre*, ſeals into the Houſe, and catching him by his Feet, ſhe hit one againſt the other violently, and would not leave off, till ſome came to his aſſiſtance, and turn'd his Tormentor out of doors. From that time he lived free from the Gout Twenty years and upwards, and made uſe of no Remedy.

VI. Blood-letting, for prevention ſake, muſt never be omitted in Plethorick Bodies, nor in thoſe that fare well, and drink high. Spring and Fall

breathe a Vein in the Arm; in Melancholick perſons bleed the Hæmorrhoids, in Women provoke the Menſes if they be ſtopt. *Galen* confidently affirms, it is a preſent Remedy in ſharp Pains, violent Deſfluxions, and high Inflammations. And if theſe three meet in the beginning of the Gout, Who will deny it in ſo urgent neceſſity? Since the Excellency of this Remedy is ſuch; Can any other more certain, or of leſs dubious event be tried? Should not this, when pains are urgent, be preferred before Purg- ing?

*Th. de May-
enne de
Aribr. p. 94.*

VII. In a freſh Gout, or in one not very inveterate, in a hot conſtitution eſpecially, to let Blood in the beginning of the Diſeaſe, often gives relief. But in an habitual Diſeaſe, a cold Conſtitution, and old Age, it uſually does more hurt than good; inſomuch as it depreſſes the Vigour of the Blood and Spirits that are not raiſed too high, without any diminution of the Morbiſick Matter.

*Willis, cap.
de Aribr.*

VIII. A Magiſtrate of *Copenhagen*, *An. 1665.* was taken with a Second Fit of the Gout; his pain lay moſt in the Great Toe of his right Foot, and the Veins of that Toe ſtrutting out very much; I ordered him to be bled where his Pain lay moſt, the Blood ſprung out as violently, as if it had been out of the Median Vein. Afterwards I applied the following Cataplaſm, and he was eaſed of his pain to the admiration of all men, ſo that within three days he was able to go abroad without any inconvenience. Take of freſh Allgood without the Flowers 4 hand-fuls, dry Flowers of Elder, Chamæmil, each 2 hand-fuls. Boil them to maſh in a ſufficient quantity of Elder-Water; add of Gum *Caranna* half an ounce, Camphire half a drachm. Mix them, make a Cata- plaſm.

*S. Paul Quæ-
drip. Boian.
Clas. 3.
Bonus Hæ-
ricus.*

IX. A Vomit is an excellent Preſervative againſt the Gout, which may be provoked by the help of Emeticks, where there is abundance of Humours; where the Joints are lax, and the Diſeaſe draws nigh, and when the Patient lives at large, and hearkens not to the Advice of Phyſicians, but indulges himſelf to the loſs of his health. But there is another ſort of Vomit, very uſeful and leſs troubleſome. If you would underſtand the Reaſon of it, you muſt know, the Original of the Gout muſt not be derived from the Liver or Brain, but from the Stomach, the firſt ſource of the material cauſe, which is afterward diffuſed through the whole venous kind. According to the advice of the *Arabians*, it is convenient to be drunk once a month, which is not unbecoming, ſo that a Man turns not Swine, but retains his Reaſon. This Advice ſuits well with thoſe Swill-guts, that ſwallow all things without ſcruple. Let ſuch ſtuff their Guts once or twice a Month more than uſual, with any ſort of Food, but eſpecially Fat things, and then drink what Liqueur they pleaſe in greater quantity than ordinary. Let them thus charged ſtand quiet for an hour, then walk gently for half an hour, and then let them put their fingers in their Throats, to make themſelves vomit, that, together with what they have gorged themſelves, they may throw up that Ropy ſtuff which did ſtick to the ſides of the Stomach; but is now waſhed off with drink, and mixt with the food.

*Th. de May-
enne, Traicté de
Aribride,
p. 16 & 26.*

X. A Purge ſhould be given at the firſt, and in the very beginning of the Fit: for ſo the Humour that is flowing, and about to flow, will be diverted from the paſſages of the Joints to the Guts. And in this Purgation two very remarkable things ſhould be obſerved; firſt, not to Purge with a gentle lenient Medicine, that may rather ſtir than evacuate the Humours, and ſo throw them upon the Joints; upon which the Pain and Swelling uſe to increaſe; but with ſome ſmart Purge, that may evacuate the Humour, and avert it from the Joints. Secondly, to wrap ſome Deſenſative above the Knees and Elbows, that the flowing Humour, if any be on Motion, by taking of Phyſick may be intercepted, make an Ointment of Bole, Pomegranate Rind and Flowers, Root of

E Biſſort,

Riverius, c.
3. de Ar-
thritide.

Bisfort, Tormentil, Roses, with Whites of Eggs and Vinegar, which you may apply, and bind on with Swathing Bands and Rollers.

XI. As to Purging in the beginning of this Disease, it is a thing much controverted: while some Physicians do religiously abstain from all Purging before the Declension or end of the Fit; Others, on the contrary, give a strong Purge in the beginning of the Disease, and frequently with good success. The Reason of this Difference seems principally to consist in this, namely, that some Gouty persons have as yet a firm constitution and tone of Humours, and of the Vessels that contain them, and have Joints not yet weakened. Wherefore, as soon as the blood or nervous juice are stirred by Physick, their Superfluities and Recrements are not presently precipitated to the diseased Place; but by yielding to the irritation and motion of the Physick, they are discharged into the Guts by the mouths of the Arteries, and the mean while the empty Vessels do draw and suck back some part of the morbid matter. But otherwise, in tender and weak Constitutions, upon the least commotion of Physick, the Excrements of both these Humours fall upon the Gouty part. Therefore they, for whom a Purge is convenient, must be Purged with a strong and good working Medicine.

Willis, cap.
de Arthritide.

XII. Violent Purgers, although they seem to do good, yet they strangely influence the Body, while they waste the Radical Moisture and Natural Heat, and much weaken the members of Concoction, so that within a little time there is as much Excrementitious Humour bred, as was purged out; Wherefore men must have a care of frequent using such Medicines and unlearned Physicians.

Crato.

XIII. *Bayrus* an Italian Physician extolls his *Caryocostinum* to the Skies, the Simples whereof, since they are very hot, and that its operation is pretty violent, I scarce think it proper for dry bodies, but only for those that are very moist and cold. And although he affirm, that when he was extremely afflicted with the Gout, and the pain was very violent, he hath taken this, and always recovered his Feet, so as to be able to walk to the Close-stool without leading; I do verily believe him, as being a learned Physician, and a well-experienced old Man: Yet it is clear, that Gouty persons should not be purged with their Pains upon them, or if they be, it must be done to purpose; otherwise, you certainly exasperate the Disease. This danger will be prevented, if the same day you take your Purge, you take at night a dose of *Laudanum*: by which means the fury of the Humours will be laid, the Spirits fixt, and when the Cause is diminished, the Ail will abate, and Nature will be restored to her former Liberty.

Th. de May-
erne, in
Tract. de
Arthritide, p.
36 & 49.

XIV. But it is to be observed, that I never use any Purge, wherein there are *Hermodyctyls*, when the Patient should be preserved from the Gout. For there is no need to fetch the Humours out of those parts into which nothing is fallen (except it be an old and knotty Gout, which, by frequent fits hath a return of its pains) and therefore let us be content with things that cleanse the Veins and Head, if it be in fault, after gentle Purging.

Spigelius de
Arthritide,
p. m. 80.

Heurnius,
meth. med. l.
2. c. 23.

XV. In the Gout we must not lightly give *Cassia*; for part of it turns into nourishment, and so renders the parts lax and liable to defluxions.

XVI. Diureticks are good in the Scorbutick running Gout: for nothing more plentifully expels by Urine the Serous Humours, contaminated with a Scorbutick Ferment, which stirs up the *Archeus* to that Affection: especially when these Specificks are Antiscorbutick, which their effect doth clearly shew; for after the use of them, the Urine which before was clear, is made thick.

Wrid. Hofm.
m. m. l. 1. c.
12.

XVII. Whether Salivation (which is an universal Evacuation) be proper in the beginning of a Fit of the Gout? I Answer, I have never made trial of

the thing, nor have I any reason, which might persuade me to use it, but many not to use it. For Salvation cannot be raised presently, but after some days, which here would be to no purpose. And Salvation proceeds slowly, here is need of speedy Evacuation; And if one endeavour to promote overmuch, you endanger your Patients life. Yet I do not deny but it would be good sometime for Gouty persons, that are clogged with much viscid Phlegm: but then it must not be in the fit, but when they are free of it, and while they are strong, so that they neglect not other things, but have respect to other peccant Humours.

Sylvius de
le Boë,
Tract. 8. Sect.
171. & se-
quel.

XVIII. Dr. Willis, cap. de Arthritide, relates a Case of a Gentleman, who, upon his being cured of the Stone in the Kidneys, was seized with the Gout. To cure which, he was advised to drink his own Urine. In a Month or two his Gout left him: but the Stone in his Kidneys returned again, and in a short time he died of a total Suppression of Urine. When he was opened, they found his right Kidney quite wasted, and in his left, between the Cavity and the Passage, a great heap of Gravel and small Stones. The Dr. imputes his last misfortune to his drinking his own Water.

XIX. Powders of Bones, Stones and Shells, as also of sharp Vegetables, which are called the *Alexiteria* of this Disease, are good in a fit of the Gout: for they conquer the Morbid Particles, and by fermenting with them, as it were mortifie, and then they cast them out so conquered by Sweat and U-

Willis.

XX. Sweats after Vomiting and Purging are commended by some in the method of Cure. Indeed, when the Heat is cooled, and most part of the symptoms gone, it were very proper to draw off the reliques of the matter in the Habit of the Body, by Sweat, or insensibly, that the Cure may be accomplished, the Swelling dispersed, the part allwaged, and made more nimble and fit for motion. But here you must take special care: for there is great hazard in Sweats given unseasonably, lest the Parts grow more inflamed, the Salt residing in them be made more fixt, and its passage thence more difficult, or its concretion into insuperable knots more easie. If therefore the Humour causing the Fit be thin enough and moveable, so as it may be drawn off at one essay, and leave no dregs or tartarous matter behind, but that most part of it pass by sweat, you may give sudorifics; but they must be very gentle, of the Decoction of Groundpine or Burdock, and you must use such a Regiment as the Remedy may prove of use, which otherwise will be very hazardous.

Th. de May-
erne, Tract.
de Arthritide,
de. MS.

XXI. A Milk Diet challenges not the lowest place among Alteratives, namely, that the Patient use no other food for three or four Months. Let him drink new milk Morning and Evening, about Noon, and at other times he may eat it boyl'd with White-bread, Barly, or Oat-meal. I have known some receive remarkable benefit from this sort of Diet; but others, who upon the use of Milk have grown worse, and their Gout not at all cured; but have contracted great Obstructions of their Bowels, and a Cacochymy. Therefore this Course should not be entered into without the Advice of a prudent Physician and diligent observation whether it agree or no.

Willis, cap.
de Arthritide.

XXII. Preparatives should respect the Humours wholly, and not the Joints (the preservation whereof must be endeavoured, seeing they contain no matter at present) otherwise the preparatives would rather carry matter to them.

Forstis, Conf.
66. Cent. 4.

XXIII. When the Defluxion is violent, and the Pains intense, nothing is more gratefull and proper to cause sleep (which stops all Evacuation, except Sweat) nor is there anything comparable to *Laudanum*, 2, 3 or four grains of which may be given at the hour of sleep, for several nights successively. In time

The. de
Mayerne,
Traité de Ar-
thritide, p.
41.

time of Pest the Humours concoct, and Nature recovers strength, and makes head against the Adversary. There are other Narcoticks succedaneous to Laudanum, but it has the preheminance above all the rest.

Willis, c. de
Arthritide.

XXIV. Alterative Medicines, by the Ancients called Gout Antidotes, are of excellent use, and taken for a long time, together with an exact observation of the fix nonnatural things, often give great Relief. Those Medicines are reckoned the chief of this nature, which are endued with a Volatile Salt, or Balsamick Sulphur, inasmuch as these do exalt the fix Salt, and they reduce the Sowre: Moreover, bitter things, such as the leaves of Germanander, Groundpine, Centaury, the roots of Gentian, Arisæolocchia, &c. (for these things are approved by experience in this Disease) seem to be proper for this reason; because they help concoction, and Chylification, and restrain the Salino-fix feculencies, that they be not carried to the Blood.

XXV. Although there be danger in all sorts of outward Applications; in Repellers, for fear of a recourse of the Humours to the noble parts; of increase of pain, when they are return'd inwards, and of the concretion of them in the Joints; in Diaphoreticks, lest when the thinner parts are dispersed, the rest of the Humour settle deeper in the part; of Anodynes, for fear of Relaxation; and of Narcoticks, for fear of weakening the Parts: Yet Anodynes seem most necessary; because Pain, that most grievous Symptom, weakens, draws the Humours to the Parts affected, causeth want of sleep, restlessness, a hot intemperature in the Bowels, and a Fever in the Blood; it dejects the Appetite, spoils Concoction, and breeds bad Blood. Hence arises an increase of bad Humours, and of the Morbifick Cause, hence vapours arise to the Head, and obstructions in the Bowels, which are succeeded by various Symptomes, especially by a decay of the innate Heat. Now by Anodynes the parts are mollified, and the Humour which lay deep in the Joints, is drawn outwards, whereupon the pains of the Gout, which before were most violent, abate, as the part swells. But the greatest caution imaginable, and the advice of a skilfull Physician is requisite, who must consider the time of the Disease, and its Matter: for what things are good in the beginning of the pain and defluxion, are not good in the state, nor are the same things proper in the declension, or conclusion of the Gout; and so, either through unseasonable use of Remedies, or variety of Matter, frequently that which hath done one Man good, does another Man hurt.

XXVI. Most Physicians condemn Narcoticks and Stupefiers; because safer means are not wanting, whereby the violence of the pain may be asswaged: And in their opinion it were better not to stop mens roaring, rather than to weaken them with Medicines of that nature. A pretty plausible pretence! As if the patient and his parts were so weakened thereby. Narcoticks indeed taken inwardly, if they be not dextrously administred, are not void of hurt; for, given unseasonably, they cause a Congelation, if I may so say, and immobility of the spirits, not by cooling, but by fixing, which is the product of a luxuriant Sulphur in remedies of that nature, and upon the immobility of the Animal spirits their influx is stoppt, and Death with suffocation doth follow. But if sharp pain do rage, you need fear no such thing from the outward Application of such Remedies; since it is certain, that one dayes pain weakens and hurts the Nerves more, than six days such outward Application. But suppose a little deadness should remain, there are a thousand Remedies to take that off; as Baths, Fomentations, Plasters, Stoves, and other things, which quickly doe it. Besides a Narcotick mixt with its Antidote becomes harmless. All Authours almost in violent Pains of the Gout, make use of Henbane: Some go as high

as Opium: If the Spleen be very hard, we apply Hemlock without any danger; nay, it is applied to the eyes, so near the Brain, with great success. And I, being backt with good success, make no scruple to apply both the said plants, with Cassia, Camphire, Saffron, Sperma Ceti, and Man's Grease, which is a most excellent Anodyne in this Disease.

XXVII. Hippocrates bids men, before Universals, allay the pain by outward Application, which our Age so much dreads before general Evacuation: but this is no new thing with Hippocrates, who knew how dangerous a purge was, if given in the extremity of pain, as appears from 4. acutor. vers. 396. He orders the pain in the running Gout and Gout to be mitigated with things actually cold. 1. Because they quench the actual heat of the running Gout, and assuage the Acrimony and Fluxibility of the Humour in both Diseases, and they dull its activity and violence in acting, from which all sense of pain arises. 2. Coolers, by strengthening the innate heat of the part affected, do better qualifie it for Coction and Expulsion of the Humour. 3. They hinder the generation of a Callus in the Joints, which hot things often promote, by evaporating the thin part of the Humour, and baking the thick. I know the Vulgar believe the contrary, who are afraid to use actual coolers in the Gout, or any pain of the Limbs: But they are deceived; for although Cold do harden as well as heat, yet the hardness caused by Cold does not in our case harden into tophous knots, because it still retains its proper moisture, although congealed by Cold, which at length, by application of heat, dissolves, and recovers its former softness. But whatever is hardened by heat, it is deprived of its proper moisture, the heat consuming and exhaling it, so that a hardness is introduced, which is not easily removed, such as the hardness of those Tophi, which the Joints of Gouty persons contract.

XXVIII. When the Fit is over, it is usual to apply Diapalma Plaster, which indeed is an innocent thing, but of small comfort. There are many better things extant, such as Emplastrum de Hermodactylis, de Minio magistrale, they call it Emplastrum Sandicis: Gum Cinnamon, and Tacamahaca dissolved in Spirit of Wine, are of singular efficacy, Emplastrum Betonicae, &c. For they that have undergone an Assault of the Gout, have occasion for the use of some remedy, that by its drying virtue may strengthen the nervous parts, whose tone and native temperament may be preserved by such things. Agineta, a learned Physician, rubs the Joints of Gouty persons with an Ointment of Oil and Salt. It is good when the pains are over, but best of all to prevent them. There is an Oil made of Winter-Gillflowers, which is much bettered by addition of the Flowers of Mullein. By the use of it, a Physician belonging to the Duke of Balloin got such strength in his Joints, that after he had been 30 years troubled with the Gout, and he had lived as many more, 10 years before his death (he lived above an hundred) he walked as stoutly, as if he had never had a Fit of it.

XXIX. Such Discutients are requisite, as may not only open the Pores, that the Serum may evaporate, and the Blood be made to circulate, as in a Phlegmon and Oedema: But such, whose Saline parts designed to oppose those Saline ones of the Arthritick Matter, may either, by mixing with them, bring them out, or by precipitating them, keep them from those painful Effervescencies. Wherefore, in this Disease, when Fomentations, or Cataplasms of Chamæmil, Mallows, Linseed and Fænugreek, doe little or no good, nay often a great deal of hurt, by relaxing the Nervous parts; some Dissolutions, or stillatitious Liquors of Sal Ammoniack, Sea Salt, Nitre, Vitriol, Quick-Lime, and the like, which, in other Swellings, or Pains, always doe hurt, are usually of great benefit. Several such Liquors to be applied to the part grieved in a Fit of the Gout,

De Mayerne

Arthritide, p. 44.

Willis, cap.
de Arthriti-
de.

and which have been tried by experience, are pre-
scribed by *Quercetani, Hartman, Crollius* and others.

XXX. He does but expose himself, that engages
to dissolve the Knots in the Gout; for if they are
grown hard, it is onely labour lost, to try any such
thing. But while the Matter is but in Gelly, I
should not think it utterly impossible, if we could
get a Remedy that would reach it, and that bore
any proportion to it; Such is *Sal Ammoniack* both
natural and artificial, yea, that which is made of
Smoak and Urine. But volatile Salt of Urine depu-
rated by many Sublimations, exceeds in virtue all
other remedies. The Pores of the Part being
sufficiently opened by a Bath or Stove, or over the
steam of a *Lixivium* made of the yellow dross of *Re-
gulus* of Antimony (whose Sulphur draws most pow-
erfully, nor is it less potent in its dissolving virtue.)
Take Salt of Urine, mix it with the best Spirit of
Wine, of this mixture make a Fomentation. Oil of
Arisenick digests and draws outward, nor is there for
this purpose a Remedy to be compared with it, if a
little of it be mixt with May Butter, or some other
Fat, anoint the Part gently. Sometime such swell-
ings are dispersed by the sweating out of a cer-
tain viscid matter, like Fat; and Blisters often arise
weeping watry drops, not unlike Eggs when they
are roasting. The main point in the use of this Re-
medy, is not to make too much haste; for often the
effect shows not it self, till the twelfth, or fifteenth
day, or longer.

Th. de May-
enne, Traité
de Arthriti-
de, p. 47.

XXXI. There are great Physicians, who singularly
commend Cabbage, and advise those that are sick of the
Gout, while their Pain is upon them, onely to eat Cab-
bage. This indeed is certain, that Food, the less nour-
ishment it affords, the wholesomer it is: Therefore
they that are troubled with the Gout, must abstain
from Hens and Capons, which breed much nourish-
ment and blood.

Crato.

XXXII. A Man should, without doubt, abstain
from Wine, and all things that supply such a Tartar
and sharp humours; For when I was once troubled
with the Gout, and had read several Authours upon
that subject, I observed they all agreed in this, that all
hope depends more on a good Diet, than on Medicines.

Sennertus,
Epist. I.
Cent. 4.

XXXIII. Let the Gouty person take a turn at
least in his Chamber, although stirring want not
pain: for heat of the Part, and attenuation and
resolution of the matter follows Motion. So exer-
cise will be good for prevention, but it must be mo-
derate. For, *Paul, l. 3. c. 75.* saith, that abating of
ones Diet, and as much exercise as is sufficient, pre-
vents the Gout.

Fortis. Con-
sult. 73. Cent.
4.

XXXIV. First of all Blood-letting, what great
things soever it promise, either in evacuating the
humours, that stand ready and upon the point to
descend; or those that are already got into the
Joints; yet it is manifestly repugnant to that Indi-
cation, that the antecedent cause, which is Indige-
stion, arising from depravation or defect of spirits
(whom taking away of blood farther diminishes
and oppresses) doth challenge. Blood-letting there-
fore may not be used, either to prevent the Fit, that
is feared, or to mitigate it, when come upon a man,
that is, in the elderly sort. For though the blood
that is taken away, be like theirs that are sick of a
Pleurisie, or Rheumatism, for the most part; yet it
is observed, that Blood-letting does harm as re-
markably in this case, as it does good in those other
two. For if blood be taken away in the Intermiss-
ion, though never so long after the Fit, there is
danger, lest a new one should come on by the agi-
tation of the Blood and Humours, that may prove
longer than the former, and be attended with more
enormous symptoms, the strength and vigour of the
blood, by help whereof it might stoutly cast off the
matter of the Disease, being thereby abated: And
this Inconvenience befalls a Man, if he let Blood in
the beginning of a Fit. If a Vein be opened presen-
tly after the Fit, there is great danger, lest nature,

while the blood is yet languid, and has not recover-
ed its strength wasted by the Disease, be so weakened
and sink by this wound unseasonably inflicted, that
way be made for a Dropsie. Nevertheless, if the
Patient be young, and heated with hard drinking,
Blood may be taken away in the beginning of
the Fit: but if he use constant Blood-letting in
the following Fit, the Gout will grow inveterate,
even in a young Man, and will increase its Empire,
or rather its Tyranny farther in a few years, than
otherwise it could have done in a great many.

Sydenham, de
Podagra, p.
33.

XXXV. Then as to Purging, whether upwards or
downwards, we must take notice, that since it is the
inviolable law of Nature, interwoven and joyned
with the very essence of this Disease, that the mat-
ter of the Disease should always be cast upon the
Joints; all that Emetick or Cathartick Remedies
can doe, will be onely to recall the Peccant Matter,
Nature had thrust out to the extremities of the body,
into the Mass of Blood, whence it comes to pass, that
what ought to have been thrown upon the Joints,
falls perhaps on some of the Inwards, and so he who
was in no danger, is like to lose his life. Which is
frequently observed fatal to them, that accustom
themselves to Purging Medicines, either to prevent
the Gout, or (which is worse) to ease the Paroxysm.
For when Nature is put out of her own way, where-
by as the best and most secure, she sends the Morbi-
fick Matter to the Limbs, while the Humours are
invited inwards to the Intestines, Patients, instead of
pains in the Joints, of which they have either none,
or but a very little, are almost killed with sickness
at the Stomach, Gripping in the Guts, Fainting, and
a long train of anomalous Symptoms. Indeed, I
am fully perswaded, being so convinced by constant
and often repeated experience, that all Purging, as
well by Lenitives, as by stronger Medicines, such as
are usually designed to purge the Joints, is exceed-
ing hurtfull; whether we Purge in the Paroxysm,
to diminish the peccant matter, or in the end to dis-
sipate the relics of the Disease; or in a perfect in-
termission and good health to prevent the coming of
a Fit. For I have experienced it both in my self
and others, that a Purge given at any of these times,
is so far from answering our ends, that it brings
the very mischief upon us, which it should keep off.
For first, a Purge given while the Fit rages, inter-
rupting Nature as she is busy in separating the mor-
bifick matter, and discharging it upon the Joints,
hath sometimes raised a great disorder in the spirits,
whereupon the Fit not onely grew stronger, but the
Patient was brought into manifest hazard of his life.
Again, Catharticks used in the end of a Paroxysm,
when they should have carried off the relics of
the Disease, onely did this, they brought a new Fit,
as severe as the former; and so the Patient flattering
himself with vain hopes, brings upon himself those
evils, which he had never suffered, had he not again
put the humours on a fret. Which Inconvenience
I my self have found, preposterously imploring
Physick Art's aid, to throw off, as I thought, the
relics of my Disease. Last of all, as to Purging
repeated at certain Intervals, and in perfect health,
that we may obviate the Paroxysm, and stop its en-
trance; although, it must be confessed, there is not so
present danger of inviting a new Fit, as was in the
former case, when the Patient was not quite out of
Gumhot; yet at this time also it breeds a Paroxysm,
and that for the causes above-mentioned; with which
mischief, if it do not presently punish the Patient,
yet it does not at all free him from his Disease, how
constantly soever, and at due Intervals, he take this
or that Cathartick. Nay, I have known some sub-
ject to this Disease, who paid their devotions to
Health by a Purge, not onely Spring and Fall, but
once a Month, yea, and sometimes every week,
yet not one of them escaped the Gout: which after-
wards, for the most part, handled them more cruel-
ly, than if they had abstained from all Physick. For
though

though the said Purging may carry off some part of the Continent Cause; yet since it conduces not one jot to strengthen concoction (from which it is so far, that it weakens it, destroying nature by a fresh wound) it is onely opposed to one Cause, and has not virtue sufficient for the Cure of the Disease. Besides, we must note, that through the same defect of spirits, whereby coctions are vitiated in people subject to the Gout, the consistence of their Animal spirits is rendered less firm and lively, whereupon it is presently scattered and disturbed by any cause which does a little more violently shake and disturb either mind or body, and therefore is very fleeting and dissipable, as it often happens to them that are either hypochondriack, or hysterick. From which propensity of spirits to disorder it is, that the Gout commonly follows any the least evacuation. For when the tone of the body is destroyed, which the firmness of spirits, while they remain in their vigour, preserves well compact and lively, the peccant matter, as having broken all bounds, is at its liberty, and upon this wound's being inflicted on the body, a Paroxysm presently arises.

Idem, p. 35.

XXXVI. But this method, as pernicious and hurtful as it is, has got some Empiricks no small credit, who all of them craftily conceal the Purging Medicine which they make use of. For it must be observed, that the Patient, while he is in his Purging course, has little or no pain; and if the Course can be carried on for some days, and no fresh Paroxysm supervene, the Patient will be quickly well of that wherewith he is at present held: But then he must pay severely for it afterwards, by reason of the disorder, into which the said disturbance of the Humours hath precipitated nature.

XXXVII. Then, evacuation of the peccant matter by sweats, though it doe less hurt than the foresaid evacuations, yet it is clear that it does harm. For though it do not retract the matter of the Disease into the bowels, but on the contrary, force it into the habit of the body, yet however it does harm upon these accounts: First indeed, because out of the Fit it forcibly thrusts out the Humours that are yet crude, and not so ripe as that they ought by right to be separated into the limbs, and so sollicit a Fit before the time, and even against Nature's mind. Then because in the Fit provoking of sweat doth force too violently the morbifick matter upon the part affected, and besides causes intolerable pain; and if the quantity of peccant matter be larger than that the part affected can admit it, it presently throws it on other Joints, whereupon there is a commotion and a great ebullition, or exstuation of Blood and other Humours; But if the body abound with a serous fluid that is apt to breed the Gout, there is fear of falling into an Apoplexy. Wherefore, in this Disease, like as in all other in which sweats are raised by Art to cast out the morbifick matter, and do not flow by the duct of Nature, it is exceeding dangerous to raise them so violently, or beyond that degree of Coction, to which Humours to be evacuated of themselves are arrived. And that most famous Aphorism of Hippocrates, *Concocted, not crude things, must be Purged*; has place as well in provoking Sweats, as in giving a Purge. Which is clearly evident from the Sweat that concludes the Fit of an Ague; which, if it be moderate, and answering exactly to the quantity of febrile matter, concocted by the preceding Fit, does remarkably relieve the Patient; But if Sweat be promoted beyond Nature's measure, by keeping the Patient continually in bed, then a continual Fever arises, and a fresh fire is kindled, whereas what was burning before, ought to have been put out. By the same reason also in the Gout, that gentle dew, which, for the most part arises in the morning of its own accord, after every lesser Paroxysm (several of which make one great one) mitigates both the pain and restlessness, wherewith the Patient contended all night;

but on the contrary, if this gentle dew, that is fleeting of its own nature, be provoked longer, and more violently, than the proportion of peccant matter already concocted by the last paroxysm, will bear, the Disease is thereby enraged. Therefore in this, as well as in all other Diseases, which I have had the hap ever yet to see, the Plague onely excepted, it is not so much the Physician's, as Nature's Province, to raise Sweats: because it is no way possible for us to know, how great a share of this same matter is already prepared to undergoe separation, nor by consequence, what measure we ought to observe in provoking Sweat.

Idem, p. 42.

XXXVIII. Whatever things therefore help Nature, in performing her Offices aright, where by strengthening the Stomach, that it may concoct food aright; or the Blood, that it may duly assimilate the Chyle carried into it, or by corroborating the solid parts, that they may better convert the Juices designed for their nutrition and augmentation, into their proper substance; Finally, whatever things preserve the divers organs of Excretion and Emunctories of the body in that state, as they may be able to void the Recrements of each part in their due time and order; these, and all such things, are good to fulfill this intention, and are properly called Digestives, whether they be Medicines, or Diet, or Exercise, or any of the *sex res non naturales*. Such Medicines are all in general as heat moderately, and are either bitter, or gently pierce the tongue, as being things that are gratefull to the Stomach, cure the Blood, and cherish and comfort other parts; such are for example Angelico and Elecampane Roots, Leaves of Wormwood, lesser Centaury, Germander, Groundpine, &c. Also common Antiscorbuticks may be added, as Horse-rhadiſh root, leaves of garden Scurvigraſs, Water-Cresses, &c. But since these sharp and pungent herbs, how gratefull soever to the Stomach, and conducing to it, in helping Digestion; do notwithstanding enrage the matter that hath been a long time bred, and encrease it, they must be used very sparingly, in comparison of those, that by their gentle heat and bitterness strengthen the Stomach, and render the mass of blood more brisk and lively. Several sorts of these curiously mixt, do better concoct the Humours, than any simple taken out of any one Tribe of them. For although, when we have occasion for the virtue of any Specifick Medicine, the rule hold good, The more simple the better; yet when we propole to our selves, to cure our Patient by answering this or that Indication, every several Ingredient contributes its share to the cure of the Disease: And in this case, the greater the number of Simples is, so much the more powerfully the Medicine will operate. Therefore, out of the Medicines mentioned, and those of the same nature, several *Recipe's* tending to this end may be made. I prefer the form of an Electuary in the manner of *Theriaca Andromachi*, before all others, as excelling in virtue; because the mutual confermentation of all the Simples increases their virtue, producing as it were some third thing, which, in equal quantity, is of more virtue in them conjoyned, than in any one of them. And for the sake of young Physicians, I discover the Remedy I my self make use of, which is compounded after this manner. *Take of the roots of Angelico, Calamus Aromaticus, Masterwort, Elecampane, Leaves of common Wormwood, lesser Centaury, white Horehound, Germander, Groundpine, Scordium, common Calamint, Feawerſew, Meadow Saxifrage, St. John's Wort, Golden Rod, Mother of Time, Mint, Sage, Rue, Carduus Benedictus, Southernwood, Flowers of Chamemil, Tansie, Lily Conval, English Saffron, Seeds of Treacle-Mustard, Garden Scurvigraſs, Caraway, Berries of Juniper, of each a sufficient quantity. Let all the Herbs, Flowers and Roots be gathered at those seasons, when they have the most virtue. Let them be dried and kept in Paper Bags, till they be fit to Powder. Let 4 ounces of each be well mixt, and made up with a Syrup of Canary Wine and Sugar, into the form of an Electuary of a due consistence. Let him take 2 drachms*

drachms morning and evening. Or in defect of this, let him use this following, Take of Conserve of Garden Scurvigrass 1 ounce and an half, of Roman Wormwood and yellow rind of Oranges each 1 ounce; of Candied Angelico, preserved Nutmeg, each half an ounce; Theriaca Andromachi 3 drachms; Pulv. Ari. Comp. 2 drachms, with a sufficient quantity of Syrup of Oranges; make an Elestuary. Let him take 2 drachms twice a day, drinking 5 or 6 spoonfulls of the following Scurvigrass Water upon it. Take of Root of Horse-Rhadiſh sliced 3 ounces, Garden Scurvigrass 12 handfulls, Water Cresses, Brooklime, Sage, Mint, each 3 handfulls; Orange Pills, No. vi. Nutmegs bruised No. ij. Brunswick Mum 12 pounds, distill them in the common Organs, till only 8 pounds of Water be drawn off for use. Of all Medicines commonly known, which help concoction, Theriaca Andromachi is the best; but because it is made up of very hot Simples, and besides abounds with Opium, the aboveſaid Elestuary may more conveniently be made of the chief heaters and strengthners, with Sugar dissolved in Wine, which will be more gratefull to the Stomach than Honey is. We must take care in the mean time, that those Simples be made use of, that are more gratefull to the Patient's palate; for, seeing they must use it a long time, i. e. almost as long as they live, it is very convenient, that it be not ingratefull to the Palate.

Idem, p. 49.

XXXIX. This must be observed above all, namely, that all Digestive Remedies whatever, whether they consist in Medicine, or Diet, or Exercise, must not be used by the bye, but constantly and daily with all diligence. For since in this Disease, as also in most Chronical ones, its cause is passed into an habit, and as it were a new nature; no wise Man can think that any light and momentary alteration, brought upon the Blood and Humours, by any kind of either Medicine or Diet, can attain the scope of Cure; but the whole habit of the body must be turned another way, and the whole Man must as it were be new forged again upon the Anvil. For neither is the case here, as in some acute distemper, when he that was as well as heart can with but even now, is on a sudden taken with a Fever, and sinks down, as if a Bridge broke under him, from a very good state of health, into a most dangerous disease. The state of the Gout is far otherwise: When a Man, by leading an intemperate life for many years one after another, omitting his accustomed exercise, consuming in sloth and idleness, or by too much study and unremitted intention of mind, and other errors of life, hath endeavoured, as it were on purpose, that the various ferments of the Body should be perverted, and the Animal spirits (which are the primary Instruments of Concoction) are oppressed, whereupon the preternatural Humours that are gathered, do at length break out, and give an overthrow, when they are exalted to the highest degree, and when the flesh is made soft, and the joints effeminate, they more readily receive the Humours falling upon them: And so at length another Nature, as it were, is by degrees superinduced, the pristine and natural oeconomy of the body being utterly overturned and destroyed: For these Paroxysms, which, in a manner, wholly take up the thoughts of the inconsiderate and less knowing sort, are nothing else but a series and order of Symptomes dependent on that method which Nature commonly uses in expelling the matter, which is the cause of the disease, outwards. Wherefore, he loses his labour, whoever goes about to stave off this disease, by using this or that Medicine, or Regiment likewise, onely now and then. But since this Habit is founded, and consists chiefly in the spoiling of all the Digestions, and in the loss of natural firmness in particular parts, we must obviate both evils, and as well the strength of Concoction, as the firmness of parts, must be reduced and restored by degrees, that is, according to the Model of the pristine and accustomed oeconomy of the body. And however impossible this may seem to be done fully and perfectly, not onely be-

cause every Habit is with great difficulty changed into its contrary, but because old Age, which commonly is companion and partner to this disease, doth violently oppose; yet, as far as strength and years will allow, the Cure must be attempted, and as the Patient is younger or older, so he will more or less escape the Tyranny of the Gout. Idem. p. 67.

XL. A Milk diet, either of raw Milk, or boiled, taking nothing else, unless a little Bread in it once a day, has been in vogue for 20 years last past. This did several good, beyond all other Medicines for this disease, so long as they exactly observed it; but as soon as ever he returned to the diet of the Healthy, were it never so mild and gentle, who had used himself to this, the Gout presently returning, handled the Patient far worse than before: for the Principles of Nature being by this course weakened, the Patient is rendered more unable to keep off the disease, and therefore afflicts him more dangerously and tediously. He therefore that thinks of taking this course, must first of all seriously consider with himself, whether he be able to persist in it all his life; which yet perchance he will not be able to do, be he never so resolved: For I know a Nobleman, who, after he had lived a whole year on Milk alone, not onely without offence, but with a great deal of pleasure; all which time he went to stool once a day or oftner, growing costive on a sudden, and the temper of his body being changed, but the resolution of his mind still continuing, and his Stomach at length loathing Milk, was forced to give over. Idem. p. 75.

Medicines especially made use of by eminent Physicians.

1. An admirable Elestuary for all Gout Pains, which I have often used with good success. I declare it eases them presently without trouble, it cools the fiery heat, and so qualifies the Part, that I have seen some sick of the Gout recover the same day they took this Physick. It is made thus; Take of white Hermodactyls cleaned from their upper coat, Diagridium each 3 drachms, Costus, Cummin-seed, Ginger, Cloves, each 1 drachm. Let them be powdered, and with some proper Syrup, or with Honey and White-wine boild together; make an Elestuary. The dose is from 3 drachms to 4. Jul. Caf. Baricellus, horti. Gen. p. 50.

2. Take of Germaner, Groundpine, lesser Centaury, Aristolochia rotunda, Sage, Betony, each 1 ounce, of the best ripe Guaiacum 8 ounces. Make a Powder. By this one Remedy the Gout may be perfectly cured, except a Man will lead Sardana-palus his life. The dose is 1 drachm in the morning for several weeks. Crato, lib. 6. Conf. 100.

3. This is reckoned excellent for prevention; Take of pure Spring-Water 10 pounds, the Wood of Mastick-Tree cut very small 3 ounces. Let them boil an hour, drink of this Water at Dinner and Supper: For it strengthens the Stomach, helps Digestion, and prevents Defluxions. This was given me as a secret by a very skilfull Physician. Rod. à Fon-leca, Tom. 2. Conf. 59.

4. In a hot cause I think nothing is better, if I may conclude from my Experience, than the Powder of Wild Cichory Leaves dried in the shade, and gathered in May. A drachm or 2 scruples may be given in a little Chicken Broth, without Salt, in the morning 4 hours before dinner, and in the evening as he goes to sleep, either with a spare Supper, or with none at all. Spigelius de Acribitide, p. 84.

The outward Medicines are either indicated before, or may be sufficiently compensated by this single one described in the following Discourse, which seems of more moment in the Cure of the Gout, than all that our great Physicians have relied on, whether inward or outward, put together.

Treatise of the Gout.

PART. I.

The Aitiology.

Ten Rhyn.
de Artibrit.
94

Although it be besides our Design to meddle with Theory; yet I have two Reasons not to omit this of the Gout. 1. It's extraordinary Novelty shall I say, or, Antiquity? New I must call it, because lately transmitted to us from the East Indies; but it must be really Ancient; For it makes up one half of a Japan Doctour, as the Needle makes the other; and they derived this moiety of their skill from Ingenious China, where perhaps its date may be so old, that the eldest Chronicle in Europe cannot Synchronize. But certain I am, it is as Ancient as our Father Hippocrates, as the Issue will prove. 2. Its extreme Necessity: For the reason why the Gout has been hitherto incurable by us Europeans, is the Ignorance of its true Cause (as Prosper Martianus in his first Section frankly acknowledges.) Wherefore, to doe the Learned Grecian, and the Ingenious Barbarian both right, and my Countrymen good, I thought it a pity to let the *Moza* go without its Reason, lest it should lie undiscerned under a multitude of Plasters and Pulveres good for the Gout, and for want of good Credentials it should not reflect the honour due to its Authours, nor afford the tortured man that ease, which it is able to procure.

To avoid therefore any farther Preamble, and not to meddle with Etymologies, we thus describe the Gout. The Gout is a preternatural, little, and for the most part invisible, and inwardly latent Tumour of the Periosteum, arising from a dry and malignant Vapour, which, by the contractive motion of the Heart, is forced with the Blood through the Arteries to the Limbs, and to the Joints thereof especially, and violently separates the Periosteum from the Bone; into which Interstice this Vapour being once forced, doth stick there most tenaciously, and distend the said Membrane of a most tender sense, and so is the cause of that sharp Pain, and sometime hinders the Member it self in its motion.

I call it an inwardly latent Tumour, to distinguish it from other stultent Tumors; for whereas these lie between the flesh and skin, or interfices of the Muscles, the other lies hid under the thin film, that covers the Bones.

I call it an invisible Tumour; not that I am ignorant how in this Disease there are Swellings conspicuous enough; but lest I should stumble upon the same Stone, at which so many eminent Doctours for several Ages have tript. For difference should be made between a Disease and its symptoms, between that Swelling that is peculiar to the Gout (which though a small one, yet is the onely cause of Pain) and that Swelling, that is subsequent to the Pain of the Part: For at the beginning, these Pains are without any Swelling; though afterwards about the State of the Disease the Part affected often swells.

The Practice of the Ancients might afford considerable Arguments for this latent Tumour, as their cutting and burning; Hippocrates, lib. 3. de morb. speaking of the Cure of the Pleurisie, saith, If he do not spit, and it give some signs of it on the side, cut or burn him. But the most cogent may be drawn from the Panacea of China and Japan, i. e. Burning by *Moza*, and from Acupuncture in Japan, which puts it out of all doubt,

that most Diseases arise from a noxious Vapour, the cause of some invisible Tumour.

And that a Vapour is the Cause, I have Hippocrates his authority for it, lib. de Flatibus. Who saith, That we live of Meat, Drink and Air; and then he shews, how the Air especially is Authour both of Life and Death to all Animals. He saith, That this Air or Spirit which in our Bodies we call a Vapour, is the sole cause of all Diseases. He instances in Fevers, Griping of the Guts, Defluxions, Dropsies, Apoplexies, Epilepsies, and concludes, that it holds true in all other Diseases; but that it would be tedious to particularize them all. When he comes to Defluxions (under which the Gout has been ever ranked) he hath these words; The Spirit is involved in the Blood near the narrow Veins, and the thinnest part (which I judge is the Vapour that causes the Gout) is thrust out by the Veins (which, with Hippocrates, is a general name, both for them and Arteries) when a great quantity of this Moisture is gathered, it runs by other passages, and when it stops in any part of the Body, there a Disease is contracted.

I therefore conclude with Hippocrates, that the Gout arises from filthy diseased steams, or from a flatulent Ventosity, upon which, if any Humour follows, it was the Vapour that made way for it.

And not onely Hippocrates, but more modern Physicians, have held, That the Gout comes from Wind. Guainerius, and Matthæus de Gradibus were of that opinion. Also Guido de Cauliaco, a stout Voucher of the 4 Humours, tells how he read in the Pope's Canons, that the Gout arose from Vapours. That Royal French Surgeon Paracelsus, was of the same judgment. Several eminent Physicians hold Vapours the cause of the Tooth-ach, Bastard Pleurisie, Colick, Epilepsie, and of Fits in Women, so that they are called Vapours in English. And I question not, but many Diseases differing onely in Name and Place, are of the very same nature with the Gout; especially all those into which the Gout and they mutually degenerate.

Furthermore, the China Physicians say, Our Bodies are governed by 3 things, i. e. by the innate Heat, the radical Moisture and Spirits, which they hold to be the Vehicle of the Heat, and the Lungs (from which they begin the Circulation of the Blood) to be the Elaboratory of the Spirits. Upon the temper or distemper, excess or defect, conjunction or separation, good or bad constitution of these 3 things, they reckon life and death do depend: And they wholly ascribe the Gout to noxious Spirits or Vapours.

These Vapours are as different, as the several Parts and Humours in the Body, that cause them. Their material causes are first Meat and Drink, thence come various Humours, from each of which a different Vapour ariseth. Their efficient causes are chiefly the Stomach, which, as it is strong or weak, hot or cold, full or empty, breeds a different Vapour; and then all parts of the Body, where there is any concoction, fermentation, ebullition, or effervescency of Humours, may breed different Vapours. Administring causes are all the six nonnatural things. He that would be better satisfied, let him read *Fle-nus de Flatibus*.

That it is a malignant Vapour, the Vehemence and intollerableness of the pain do prove. Nor do several Authours deny it, especially Galen, who assigns good reasons for it. Because the Gout never comes to Suppuration. Because this Vapour causeth more intense pain than any Humours, while they suppurate; Because it creates no trouble in any part by which it passes, except the Joints. But, which is of greater moment, the Cure proves it: for whilst in the Gout men are burnt with *Moza*, sometimes Wind hisseth out of the Burn. And if it be kept open like an Issue, an ichorous, filthy, malignant matter weeps out of it, which stinks most offensively.

All grant that the *Periostrum* is a very sensible Membrane. Now this Vapour doth not torment it on the out-side, but it insinuates it self between the Bone and it, and so parting the delicate and extreme sensible Membrane from its Bone; and, distending it, causes a raging pain. And the Tumour lying so deep, no wonder it cannot break prison, till way be made by a red hot Iron, or by the milder Burning of downy *Moxa*.

This Vapour, the cause of Diseases, extends it self as far as any *Periostrum* enwraps a Bone. And so the Gout may come under as many denominations as it hath Parts to afflict. The Learned Languages have Christened onely three, the Hand Gout, Gout in the Feet, and the *Sciatica*, for all which England can afford no more proper name than Gout in general, or what it borrows from other Languages.

As for the antecedent Cause of the Gout, I cannot impute it to any particular part. But, I think, whatever Part, or Humour therein contained, is apt to breed a Vapour; from that same part the Vapour may be carried to the Heart by the Veins, and so from the Heart communicated to the Limbs and Joints by the Arteries. Which is the Reason that several are troubled with Fevers, Swoonings, Palpitation of the Heart, and infinite other diseases, when this Vapour is not cast off to the out-parts; But with some the Gout is reckoned a good sign of long life. This Circulation of the Vapour is a reason also, that the Pains remove from the Feet to the Hands, and from any one part to another. And the Vapour being cast off by the Arteries, might be the reason why in Ventosities the Ancients approved of Arteriotomy beyond Phlebotomy; and does indicate, that the burning with *Moxa* should be where the Arteries beat most, which is not duly observed by the *Chinois* and *Japanois*. If the Part be so strong as to return the Vapour by the Veins, or if any one be so much an Empirick as to repell it to the Heart, it proves often Tragical. Wherefore I do caution all Practitioners not to use Repellents by any means.

PART. II.

The Diagnosticks.

A Physician can no more direct his Remedies without observing the Symptomes of a Disease, than the Master of a Ship can steer his designed Course, without observation of the Stars and his Compass, and a competent knowledge of the Shelves on a dangerous Coast. Therefore we should reckon as much of the knowledge of the Symptomes, those especially called Pathognomick, which live and die with the Disease, as we would of the Cure it self.

Impediment in Motion and Pain are inseparable signs of the Gout, which spring, grow up, come to a pitch, decrease and vanish with it, sure tokens of an inward latent Pain, that rarely is observable by the eye. With which we rank the Swelling of the Veins, and the violent beating of the Arteries for Signs and Symptomes, always concomitant to the Gout; because we find them by experience.

The Pain of the Gout is a piercing, distending, throbbing, deep, continual and bitter Pain; each of them a certain sign of the *Periostrum's* being afflicted. It is piercing, because a Membrane of a most delicate sense is hurt; Distending, because the Blower up of the Gout separates, raises and stretches it; Throbbing, because the Authour of this Disease passes the Arteries, and makes the blood move inordinately, while it is forced into the part affected; it must be deep, because in the Membrane about the Bone; Continual, because the Vapour pours in continually into the pained part, as long as it hath any matter to supply it; And then it must be sharp, because, while it abounds in quantity and malignity,

the Vapour cruelly and violently molests, fills, separates and distends a membrane of most exquisite sense, nay, and sometimes dissolves continuity, as the violence of the Pain doth argue.

The other Symptome is Impediment in Motion, of the same nature and degree with the former; which happens not through any fault in the Member, but onely in the *Periostrum*. And this difficulty of Motion appears and disappears with the Gout.

And these two inseparable Companions follow the Gout, as a shadow does the Body; the rest that are reckoned up by Authours, are but Accidents of Accidents. So Fainting, Watching, Inflammation, *Erysipelas*, and that Swelling from the flux of Humours, are all caused by pain.

Now let us a little farther consider this serous Tumour, because most Authours taking it for the receptacle of the Arthritic Matter, have made no difference between it and the Gout, and so have made strange Mistakes about the Proximate Cause of the Gout. Would Men but consult their Senses, they might find, that this Swelling does not presently begin, nor always end with the Gout. And although in some the Swelling follow the Pain immediately, yet whoever narrowly considers the thing, he will never find the Pain and the Swelling of the same date. Nay, when the Pain is come, the Swelling may be prevented by a skilfull Physician, if he go about it soon enough, namely, by dispersing the dolorifick Vapour in time, by some convenient Means; as by that incomparable way of Cure in *China* and *Japan*, by burning with *Moxa* (of which in the Cure) I have experienced it hath been done a thousand times. Nor doth the Swelling end with the Disease: For as the Swelling rises when the Pain is sharpest, and the Disease at the height, so, when the Pain is over, the Swelling often continues. Therefore it is the inward hidden, not the manifest outward Tumour, which causeth the Gout; and the outward is onely a Symptome of the inward: For all Writers agree, that Pain causeth a flux of Humours to whatever part it is in. But it would not be amiss to consider, why upon the approach of the Humours and Swelling, the Pain generally abateth, as in the Gout and Tooth-ach? According to this Hypothesis, the reason is, because the flesh, by the afflux of Humours is softened, and so presses not so hard on the *Periostrum*, as before; and the *Periostrum* it self being moistened with the same Humours, its Pores are opened as in a Bath, and so way made for the noxious Vapour to depart. Not but that a Conflux of Humours doth sometimes more mischief than the Gout it self, by dislocating and knotting the part; which are the usual effects of Empiricks Bathings and Anodynes, but may easily be prevented, as hereafter shall be shown in the Cure.

Which being stretched by the included Vapour, is upon the motion of the Joint compressed, and so the pain encreased.

PART. III.

The Cure.

Hippocrates saith, That the Instrument cures what Physick cannot; Fire cures what the Instrument cannot; and what Fire cannot cure, must be reckoned incurable. Now the Gout hath been held incurable for many Ages. Victorious Charles V. was conquered by it, and would break out into Expressions of this nature; The best Medicines for the Gout are to Weep, and Suffer; Therefore he used not with *Asa*, onely to seek to the Physicians: but he sought the Lord. But that which hath hitherto rendred the Gout incurable, was the ignorance of its Cause and Remedy, which are now happily both discovered. The Cause we have formerly discoursed of, the Cure is Hippocrates his last, and Nature's

Nature's utmost, Fire. To reckon up all Cauticks, Potential and Actual, from a Sinapism to a Burning-Iron, and to shew their use among Ancient and Modern Physicians, would be too tedious. I shall therefore fall upon the relation of a safe Antidote, for this stubborn Disease, and cruel Punishment of Mankind.

In my travel, while I lived among the Dutch at *Jacatra* in the *East Indies*, as Physician to the Noble *East India Company*, I was acquainted with Mr. *Herman Busheff*, Minister of God's Word (now dead, and lamented by all good Men) who was not solicitous for the health of his Brother's Soul onely (which was his proper Function) but for that of his Body also. He had, after many severe Fits of the Gout, and the trial of several Remedies, happened upon a true Anti-arthritis, which he freely communicated to me, and gave me his own thoughts, and desired my opinion of the thing. I, in civility, but with a doubtful mind, admiring the Paradox, commended the method of Cure, and to say nothing of its cruelty, I praised the benefit of it: He was very urgent with me for my Opinion, therefore I took my Pen, and while I was preparing for a Voyage to *Japan*, I writ my Friend some Objections, who, being somewhat disabled by his last Sickness, answered them in short. When I arrived at *Japan*, I found all people marked with deep and large Scars all their body over, and not for a punishment. Then I examined more accurately by Experience, the things that I had onely reasoned upon with that Reverend Person formerly. What I found consonant to Truth, I retain'd, what I found dissonant I rejected, and gathered my observations together. It would be tedious to relate all of them; therefore I shall confine my Discourse to the Cure of the Gout used among the *Chinois* and *Japans*.

Provident Nature, that is solicitous for the Preservation of Mankind, seems self-sufficient in all parts of the World; so that Barbarous Nations are no more destitute of a convenient stock of Remedies, than they, who by long Art, difficult Judgment, and dangerous Experiment, have found out infinite Remedies for Diseases, whereby Physicians are rather confounded than informed, and Patients overcharged than relieved. And Nature's goodness is seen in the *Japan* Nation more than in any other; where Health is encountered with 3 Enemies, their Manners, their Luxury, and Idleness. The first debilitating Hurt, which they suffer from their Manners, is in their Clothes, especially in Coverings for the Head: For these people, by a legal Custome, generally shave the Heads of their Children quite bare: In their youth they let their Hair grow long and thick; but they shave it to the very *pericranium*, upon the Coronary Suture, where it is joyned with the Sagittal, and where the Skull opens the most: But when they are come to Man's estate, they shave their Crown round to their Ears, and keep it smooth, and reckon it very gentle (which they use at twenty, and rarely neglect when they are above that) to go abroad with their Crowns shaven; upon which shield of their Brains all the Injuries both of a Winter and Summer Air do light: Some of them indeed in a very cold Winter cover their weak Heads with a Silken Periwig.

Furthermore, their decrepit Old Men, they that after the common custome of the Country lead a solitary life, or Monks (of whom here is a vast number) they that profess Physick, and some Servants to Noblemen, those of them especially that serve in the Kitchen, or Bedchamber; old Maids and Widows, without any difference of Sex or Age, shave their Head to the skin, not leaving one hair. Whereupon the Brain, the seat and Metropolis of cold and viscid Humours is filled with them, and they afford Matter for Vapours, which, according to *Hippocrates*, are the cause of all Diseases. This Vapour running down the Spine affects the Nerves, and so may

affect the Membrane of the Bone, which is onely a product of the Nerves. I have often observed, that either through Necessity (that is, either when they are forced to go before their Magistrates; for they never appear before them unhaven; or upon Holy-days, which none but profane persons keep with long hair) or through finery; they sometime shave in the midst of Winter; upon which a shivering all the body over, Fever, Head-ach, and other mischiefs have followed. Besides, they all go barefoot, unless in extreme Age, or Winter, and then they cover their feet onely to the Ankles. Then their Luxury (in which most of the *Japans*, especially their Great Men, place their chief good) doth most Beast-like exercise them too much in Venereal Acts, from the beginning of their Youth to very Old Age, who being thereby debilitated, are liable to Vapours, and so made subject to many pains. Thus the *Japans*, to whom Nature hath given a strong Body, a temperate Clime and Soil, who never knew the Contagion of a Plague, nor are sensible of the Devastations of War, the rich of them are consumed by Pleasures, the poor by Famine, and both by their Manners. Hence, I say, they bring upon themselves innumerable Diseases, especially those that come from the Head, and such as trouble the Nerves, Tendons, Ligaments and Membranes; They have Epilepsies, Apoplexies, Palsies, and all Diseases of the Brain and Nerves frequent among them, but nothing more than Blindness and the Gout. They reckon Blindness generally incurable, though it arise for the most part from Suffusions, which if they knew how to remove, as well as several of our Countrymen, they might restore sight to very many. As soon as they perceive the signs of Blindness, they lead a Melancholick life, without hopes of ever recovering their sight, nevertheless giving themselves, as long as they are able, to *Venus* unmeasurably; and to make the matter worse (which is a double blindness) they shave their whole head. They cure the Gout speedily and easily, unless it be inveterate. They know not the use of an actual Metallick Caustery, nor of a Lancet, except a very few, who learned it of our Surgeons. Among themselves they have, by the guidance of *China*, adapted a two-fold method of Cure to the foresaid Diseases, namely, Acupuncture, and burning with their *Moxa*. Their universal Menstruum is Water, where they borrow a Medicine of the Animal, Vegetable, or Mineral Kingdom. And I profess I have not met with a Disease among them, which the unskilfulness of their Physicians had not either caused or increased. And this concerns not onely the richer subjects (for the needy die without comfort) but the Princes of the Empire themselves, who (I speak by experience) out of their hatred to Christianity, chuse rather to die than use our help; although they value the judgment of any one of our Countrymen about a Disease, if he be onely a Quack, but they difficultly admit of our assistance. And I think it is God's peculiar Providence, that, as he hath wisely created all things, he also defines all by a set number: for I am of opinion, that in a few years, a Nation so fruitfull in Children, would be so numerous, as to eat one another up; but that the preposterous Cure of their Physicians, more mortal than their Diseases, takes off a great number of the Rich, enfeebled with Ease and Luxury; and that Famine sweeps away the greatest part of the Poor, which being contrived by the Tyranny of the Great Men, makes an unjust slaughter among the Subjects; however gratefull to Men in Power, while Dearth brings an undeserved devastation upon City and Country.

But kind Dame Nature compassionating the Calamities of this Country, and sympathizing with the Grievs of the People, hath given them the Juice of wholesome *Ambrosia*, and an Odoriferous *Panacea*: And she being an earnest Preserver of her self, affords

present Remedies for the most common Diseases in great abundance. She hath enriched with this gift of self-sufficiency, not Europe onely, famous for Arts and Sciences, and Egypt for Physicians, but the whole habitable World, and all the parts of it, though never so barbarously peopled. That was clear in the desert Country of Japan; when in the first peopling of it, it was possesed onely by some Runaway Chinois. For Mugwort seems as if it were planted by Industry all over the Country of Japan (where, notwithstanding it grows plentifully of its own accord.) And this is their onely refuge in most Diseases, this is their most pretious Panacea in all sorts of Pain and Swelling; whose use is well known to every Japonois; nor can you find one in that vast Empire, who uses it not. But the Japonois are negligent Cultivators of Gardens, and Herbarism: for they commit the growth of Plants (whereof there is great scarcity in some parts of the Country) to the care and conduct of Nature, and prefer the neglected face of the Plain before the fine and artificial ornament of Gardens. Because Ground which has any likelihood of fertility, is presently either plowed or dug for the profit of Rice, or Bread-Corn, and the Plants that remain on the Way-sides, are either cut to feed Horses and Cattel; or before the planting of Rice, they are thrown into the Field to rot for dung. Most of the other Tracts of Land are either barren Mountains, or incultivated Woods. They seek their chief Refuge, as for what concerns Physick, in Mugwort, and find it: Nor is there a Plant in all Japan more frequent than this: It grows plentifully in the Fields and Way-sides: The Japonois call it *Jomongi* and *Nophouts*, and when it is dried, *Moxa*. This is the Mother of herbs, that Royal Plant, which the Ancients called *Parthenis*, because it cured Maidens Diseases; the Italians call it *Valentine*; many stile it *Self-potent*; this is that Messenger of the Graces, which *Artemisia*, Wife to *Mausolus* King of *Caria*, honoured with her own name, as an excellent *Phylactery*; some would derive it from *Artemis* *Ilithya*, i.e. *Diana*, because it particularly cures Womens Diseases.

This therefore so highly celebrated Mugwort, when it is turned into flame and ashes, does the most good, because while it hurts, it cures; and it cures wonderfully the profound racking pains of the Limbs, oftentimes in a moment, which is a thing of the greatest moment. It were too long to run over all the Uses of this Remedy in most Diseases; wherefore I shall confine my self to the use of Mugwort in the Gout, especially according to the Practice of the Chinois and Japonois, premising onely a few things. *Matthiolus* upon *Dioscorides*, says, That 3 drachms of dried Mugwort Leaves powdered given in Wine is good for the Sciatica. *Weikardus* also makes it a Specifick for the Gout: for in *Thesaur. Pharmaceut.* he saith, That Mugwort roots boiled with Viſuals, like Parsly Roots, help a Man wonderfully. For many onely by the use of them have been cured of the Pain of the Gout. But if instead of the Roots boild, and the Powder of the dried Leaves, these Physicians had used the Down of the dried Leaves, they had done the business. For *Celsus* speaking of the pain in the knees, saith, All such pains when they are inveterate, scarce go off without Burning. *Hippocrates* is very copious about the ways and benefit of burning, wherein he seems, in my opinion, to have proposed a threefold scope; The mitigation of Pain, evacuation of an Abscess, the Restauration of a weakened or dislocated Limb. Therefore, according to his Laws, Whereſoever Pain is gathered, do you burn; nay, Whereſoever any Pain (except of the Spleen) is felt, do you burn, for so he will be presently cured.

While he shews the place that should be burnt, and patronizes our Opinion, he saith thus; This (meaning Bloud) runs by the Thigh through a sanguifluous vein, and whereſoever it stops there is a very manifest pain, troublesome indeed, but not mortal: Therefore, if pain gather to one place, and abide there, and cannot be removed by Medicines, burn it, in whatever place the pain shall be. Nor is

he less clear, where he says; And this indeed is a long disease (meaning the Gout in the feet) and troublesome, but not mortal; if therefore any pain remain in the Toes, burn them a little above the knot in the Joint. Not onely, that the hurtfull Flux of Bloud may be staid; for if you burn a Vein in any Grief (for the sake whereof it is burnt) the Vein does not heal up, but it is good for the Flux, for if it be burnt, the Flux is stopt: But also that the Vapour, that Disturber of the Bloud, may be disperſed. Where, as in many other places, by a Vein, according to the Ancients way of speaking, we must understand an Artery: for it beating quicker and higher is the true Index of the Pain.

Concerning the second Indication in Burning, the same Person saith; If both the Part be pained, and the Flesh be subnuous (or as in several other places, putrefying) Burning is the best remedy for them. But above all things *Hippocrates* his Golden Rule is to be observed by our Pyurgian; What things you ought to discharge, whither they have a tendency; the same things you ought to discharge by places convenient.

But what he saith of the restauration of dislocated parts by burning, the third Indication, you may see in his Book de *Articulis*, and other places. For it would be tedious to mention all the testimonies and precepts of *Hippocrates* about Burning.

He had variety of caustick Matters, as Iron, Raw Flax (which is nearest *Moxa*.) And if there be any pain left in the Toes, burn them, and you must burn them with raw Flax. He made use also of Box Spindles dypt in scalding Oil. And so the Chinois dip their burning Hurds (when they are minded to burn deep, and make the Sores run long) in scalding Oil. *Hippocrates* used fungi also.

But the Practice of China and Japan doth supply us with a gentler and safer Remedy than any of these. The greatest part of the Practice of Physick there, consists in burning with herbaceous Hurds, the success whereof is almost as great in the event, as the plenty and diversity of cases. At first I wondered at, nay almost detested a remedy so unusual to us Europeans, till convinced at last by repeated success, I my self patronized so beneficial a Method of Cure. I was persuaded into a good opinion of it, by the frequent experience Mr. *Herman Buschoff* had told me of it. But I was not fully satisfied, till in Japan I saw Thousands of Instances; for there is scarce a Japonois, that has not made trial of it in himself; for Diseases coming, as I think, from Vapours; or as Authours teach, from cold-Phlegm.

When I first arrived at Japan, one of our Interpreters, a little more curious about Physick than the rest, came to me halting, and leaning very much on a staff: He complained of the Gout in his knee, and as I was discoursing him about this Remedy, he told me, Perhaps to morrow you will admire the virtue of so present a Remedy: The next day he return'd according to promise, and then walked without any impediment; he shewed me his knee plastered up with Japan paper onely, to defend the Sores that the Burning had left, which he shewed me; And thus (quoth he) we remove all Pains from our Limbs. But afterwards innumerable examples did no less remove all doubt from my mind, than this Burning did the pain from the Limbs of sick people.

The Gout is cured by removing its Cause, i.e. by evaporating the Vapours that lie between the *Pertæum* and the Bone, after this very manner, which I observed with my own eyes: for Mr. *Buschoff* was mistaken in this, either through the unfaithfull or ignorant Relation that he received. Their way of preparing it is simple. They gather the smaller Leaves or Tops of broadleaved Mugwort (for Japan knows not, at least as far as I could find, the small leaved, as Herbarists call it) they dry them in the shade (then they are called *Moxa*) when they are dry they rub them with both their hands, they cast away the stalks, the fibres of the Leaves, and all the useles relicks and rubbish; but they keep the Down

Down for Use, which is like Cotton, if it be right prepared. And this general way of preparing *Moxa* all over *China* and *Japan* is known to the meanest sort; and not onely to their Physicians; nor is the use of it more common than the thing it self. Then they take this Down made of dried and cleansed Mugwort, and between their Thumb and Fore-finger, form it into a little pellet something bigger than a small Pease, with a sharp prizm and broad base; Or they put the cotton of the Herb purified in a Paper, and roll it with their flat palm, that so the plantary Wool may be close, and more equally compact, from which they cut off their pieces, which are about twice as thick as a Writing Pen, these they lay on the place grieved (when they have wet it with their finger moistened with their spittle) and with a Candle or some other way they give fire to them (oftentimes one after another) that by this means the Tormentor of Mens Joints, and Authour of all pain may be got out and sent going. They set these Tents on, either with the tops of their fingers, or with a flat hand: But here the Pulse of the Arteries in the place affected must first be felt (which in *China* and *Japan* they take no notice of) that we may be ascertained where the Vapour resides. But, according to *Hippocrates*, the Body must be kept in the same Posture, as these Nations also observe. This matter is easily combustible, if it be prepared as it ought: for the *Chinois* carry it about them in Tinder-boxes. They touch the top of these Hurds with a lighted Match (which the Rich Men in *China*, not in *Japan* as to my knowledge, make up with Perfumes) when they have given fire, the gentle flame turns not all this little Turret into Ashes, but leaves a little Segment of it in the Base, which draws the *Epidermis* with no Violence, nor raises any Blister, unless it may be a very small and superficial one: But for the most part it leaves onely a dusky Spot, although the Burning be renewed several times upon the same part, and according to Art a Wound be endeavoured: Because like a Cupping-Glass (for this burning with Mugwort serves the *Japanois* instead of Cupping, Scarifying, Blistering and Blood-letting, which last depresses the vigour of the Blood and Spirits without Diminution of the Morbifick Matter, especially in hot Countries) it imbibes the Humours, that they do not corrode the skin: for the Humours at this Burning run like lightning. Nor is this Burning (which beside the great ease it brings, highly commends this sort of Remedy) very painfull: for it is a soft Down, nor is the flame thick, or great, nor does it penetrate the skin; and the Conflagration it self is momentary.

This Burning in weaker places is commonly reiterated three or four times; but in other places, if the Patient be strong, and the Vapours lie deep; for example, in the *Sciatica* (in which *Hippocrates* orders many large scars to be made with Burning, where the *Chinois* and *Japanois* Burn many small ones near one another) it is repeated sometimes twenty, thirty, nay, above fifty times; till that mischievous Vapour exhale, and there is no fear of any mischief upon it, nor any remainder of Pain: But as soon as the Burning is over, you may handle the burnt part, or press it as you list. For this burning of *Moxa* allwages the Pain, and for the most part takes it quite away.

Some to the Utility of this Burning will perhaps oppose a contrary Experience, and say, That by vexatious Burnings, Gouty persons do spend their Animal and Vital Spirits, spoil Nutrition, and (which is the least of all) disfigure the skin with scars. But would my Opponents go to *China*, or *Japan*, they would there find, that People of every Age, Sex and Condition, in every approach of Pain, whether inward or outward, and at the appearance of any Swelling, do burn with their *Moxa*; and, that the oftner they burn, the stronger they grow; nay,

that when they are well they burn, for prevention of any Disease they fear: Although, I confess, it sometimes happens, that by a long, violent, and often repeated Burning, they sometimes fall into Swoons, and that this Burning in hot Regions (where more Spirits go out by the pores of the Body always open) does less good than in colder places, where the habit of Mens Bodies is contrary. Besides, tender and lean People should not be burnt so violently, nor so frequently, as those that are strong and of a full Body. And as for Scars, I ever thought Health was to be preferred before Beauty. Therefore, what *Pliny* said of Fire in general, I may truly say of this Burning Down; And there is a medical Virtue in the very Fire; especially in that of ours. So *Galen* allows, that the help of Fire is beyond all Physick, when he saith, that Burning is a Remedy which empties the whole substance of that which troubles: Which *M. A. Severinus* interprets so; There is no Disease so difficult and impenetrable, that cannot be conquered by the force of Fire, especially if we exactly knew its strength and use: For as the Flame is fed by the Air, as its food and fuel; so this Artificial Burning in noxious Vapours is more kindled by their Bellows, and, which is the chief thing, it exhausts and disperses them.

Yet we must assist Nature, when she is weak, and a small Escar is to be separated after this manner; Bruised Garlick must be laid on the Escar, which again must be covered with its own skin moistened in ones Mouth, and so laid on to keep it instead of a Plaster; and then after 24 hours the Garlick Plaster must be taken off; for the Scab will be ready to fall off, behind which, when it falls, there remains a pellucid Scar in the Cuticle, very rarely a round Blister; which, nevertheless, if it do arise, must be gently cut with a pair of fine Scissers, that way may be made for the peccant matter; nor must the Scab be taken off with such harsh Instruments as a Penknife or Razor. This Escar is easily taken away, if you take but a Leaf of Plantain (the common cure for Wounds and Ulcers among the Country people in *Japan*.) Bete, Cabbage, Syri, &c. roasted a little, and rubbed in ones hands to make it soft, and so apply it, and wait with patience till the Escar fall and it heal. Where you must observe, that if the Plantain Leaves (first laid on hot Coals, till they grow limber and fall together; then they must be laid on the Palm of the hand, and spread open again) be applied hot and moist on the ribby side, it will run matter like an Issue; but if they be applied on the smooth side (when the Sore requires healing) the Wound closeth (which while the *Japanois* neglect, and cause their Sores to abound with unctuous putrilage, and the flowing matter to grow crude again, by this Burning they are disfigured with filthy Scars) quickly, and without any notable Scar, more conveniently than the best Plasters, which, because of their fat, should be rejected. But the falling of the Escar is not at all to be hastned, although it stick never so slenderly to the Sore; that work must be left to Nature, nor must the running of the matter be stopt, nor must they by putting in of Pease, be made mere Issues; but of its own accord let the matter ouze out as much as it will: Wherefore the Leaves are to be kept on with their fibrous side to the Sore, because so the diseased matter runs out more freely; but with their smooth side to it not so long, because then the Wound would close up too soon; the nervous side of the Leaves therefore must be kept to the Sore, and that they fall not off, must be bound on, or kept on (where the Place will not permit binding) with sticking Plasters, and in twice 24 hours time at least, must be renewed. But if Plantain (which abounds in *China* and *Japan*, where this method of Cure is most used) be wanting, Cabbage, Bete, Coltsfoot, Ivy, or the like, may be used in its stead: Which, if they should all be wanting, as at Sea, *Diapalma*, *Basilicon*, or which I

like better, *Sticticum Paracelsi*, or some such Plaster may be used. I remember I have seen evident marks of this Burning among the Inhabitants of the Island *Timaon*, and them of *Jawa*: And I kept a *Malabar* slave, who had deep Scars of this Burning (which was performed, as he said, with dry Leaves) remaining in his Buttocks.

But it is not enough to shew the Port, unless likewise you shew the Rocks, which may endanger your striking. The *Japans* therefore, whose practice of Burning I here especially teach, do give in charge;

1. That in burning Fevers, whether remitting or continual, so long as they observe their Periods, or have their Paroxysms with their Accidents, Mens Bodies must not be burnt with *Moxa*; they having found by experience, that the Fever and its Symptoms are thereby encreased.

2. They forbid the use of *Moxa* in the Fit of an Ague, which the *Japans* carefully observe; but out of the Fit, they earnestly perswade it, and diligently administer it.

3. They forbid Burning, when one hath got a Cold; otherwise they say, a Fever, and often a most grievous one doth follow, especially if they do not wrap themselves warm with clothes: Which they always enjoin in the administration of Burning, for fear of a Fever, as they find by experience; for otherwise the external cold of the Air, when the pores are opened with Burning, out of which the Vapours went, insinuates it self, and so the first Disease turns to a worse.

4. They refuse also to burn Teeming Women till an hundred days after they are delivered. Which must be understood of those parts; for, for the Head-ach, and other Diseases of the Head and Breast, I have several times ordered Women newly delivered to be burnt, and with great success.

After Burning (that is, the first days after the first Burning) they touch the burnt part, often and softly, either with their finger, or rather with a clean Rag dipt in salt water, but lightly, for fear of a Fever; taking great care, that the Water be not over salt, nor their finger too cold or moist. Although this Monitory Rule hold not in all; yet it brings this advantage with it, when duly observed, that it draws the purulent matter out of the Brand sooner and safer.

L. 3. de
Mo. b. 5. §.
26. To these you may add (if you please) *Hippocrates* his Caution; It is more Mortal (at least more dangerous) to Burn the right hand Parts than the left.

But they that think much to take so great pains (for the *Japans* are true Haters of Labour) use other actual Cauteries, in the use whereof they follow not this exactness of rules; they therefore make a Roll a little longer than ones finger, but not quite out so thick, of the whole dry Leaves of Mugwort; with this long Tent they cautiously and lightly touch the place to be burnt eight or ten times, and at the last they set it fast on the Place. The *Japans* call this and the former Operation also, *Sinkiu*, the name and use whereof they took from the *Chinois*, among whom this latter (at this time at least) is not so usual: I prefer the common way of Burning with *Moxa* before this. For the right performance of which, according to the Laws of Art, Practitioners in *China*, and *Japan*, have their Schemes, in which, according to their small knowledge in Anatomy, they have marked the places in the whole Body designed for Burning: I should rather consult my Senses, and burn whereabouts the Arteries throb. Most of the *Japans* use this Chirurgical Pyrotechny once at least a year, usually twice or oftner, to prevent Diseases; in the same nature that our People use to Bleed and Purge, for Prevention sake, in the Spring especially, when the Humours are in a Ferment.

But the Physicians of *Japan* have a secret way of Burning, which they make use of in the most grievous and Chronical Diseases, as in Consumptions; and where Mens Bodies are weak and Bloudless: They call this *Siqua*, i. e. Burning of four places; they perform it with the well-known *Moxa*, namely in the Region of the Loins, near *Os sacrum*, where they set two Turrets, one on either side near the Spine; and two, one on either side, a little farther from the Spine. Hereby they hold, that strength is renewed, and that Vigour is acquired to the Genital Parts: Wherefore, I have often observed, how the Luxurious (as most of the *Japans* are) have Scars in these places. And perhaps burning in these places might doe good in that *English* Disease, called the *Rickets*. *Hippocrates* in the like case uses it; namely, when the Spinal Marrow is very much dried, when the Veins tending to the Marrow and access from the Head are stoppt; Burn him in four places on his Loins, on each side of the Vertebrae; and in fifteen places on each side his Back; and in two places on his neck among the Tendons: for if the Burning have success, you cure him: but this is a grievous Disease. But you may consult *Hippocrates* himself in what Diseases, and in what Places for each Disease Burning is proper; and you may doe that with *Moxa*, which he did with some far more violent Causticks, with others more gentle, and much of the same nature, as *Fungi*, and *rad Flax*.

L. de Affict.
intern. Scib.
14.

Now the Physicians in *China* and *Japan*, do distinguish the places that should be burnt (wherein the whole Art consists) in singular Figures, which they account the Rarities of their Art. And although the Vulgar do administer this Burning with *Moxa* to themselves; yet there are peculiar Surgeons among the *Japans* (whereof I am an eye-witness) that make it their business onely to perform this Operation and Acupuncture; they call them *Farys tensus*; their Shops may be known by their Carved Images (in which, the places to be Burnt are marked) as our Surgeons are by the Sign of the Pottingers. For it is of such moment to know exactly the Places to be Burnt, that it is become a peculiar Trade, in the same manner that our Oculists, Cutters for the Stone, and Rupture-Curers, appropriate each of them a peculiar Craft to themselves. And the manifold experience of Burning hath taught me, that much depends upon the distinct knowledge of Places: For the *Japans*, when they have lost their Stomach, burn a certain place on their Shoulders, to recover it; which the Skillfullest Anatomist in *Europe* can scarce give a reason of: They burn the *Os sacrum* and Loins in a *Gonorrhoea*, and in weakness of the Spermatick Parts: But which is more wonderful, I know a place in the Belly, not far from the Navel, which, if burnt, a certain Effemination follows, without any hope of recovering a Man's Virility. I knew a *Japanese* Matron, that now lives among the *Dutch*, who, upon her Faith, told me, That in her Infancy she had a Swelling arose in the Nape of her Neck, which, when the Physicians of *Japan* had tried to remove, by all sorts of means, they cut it off; but it grew again; till a certain old woman, looking upon the Excrecence, laughed at the preposterous endeavours of the Physicians, and applied *Moxa* to the middle of the sole of her Foot; whereupon the Swelling immediately withdrew it self from the Eyes of the Spectatours, and then utterly vanished, without any sign of Return to her old Age. What will you guess now, you *European* Dissector? Whoever desires to be informed in this knowledge of the Places, he must get some *China* or *Japan* Schemes; or if he dare not rely on them, let him observe that Rule of *Hippocrates*; Wheresoever you feel Pain, Burn it. Burn the Part affected, where the Artery beats violently, or not far from it: Do not lightly burn the Nerves, or the Nervous parts, if you can avoid it; rather chuse the Bloud-vessels (those genuine Habitacles of noxious Vapours:)

pours:) Which, notwithstanding, cannot always be observed; because the Vapour, that is the efficient cause of the Gout, commonly resides, and is as it were imprisoned in the Nervous Places. Burning cannot be administered to the Spinal Marrow without Danger. Besides, the *Japonois* either never at all, or very seldom (and then with great circumspection) burn the inner side of the Feet, or the upper part of the Arms, where the Nerves, Tendons and Ligaments, are covered with but little flesh; but the outer Parts of the Feet and Arms, in the Interstices of the Muscles, because there the Bloud-vessels (the Place and Course of Vapours) do lie. But he that pertinaciously doubts whether it make so much matter, where a Man be burnt; I will allow him the foresaid place in the *Hypogastrium* (a Fingers length below the Navel, right downwards upon the *Linea alba*) with the artificial way of Burning, as I hinted before, whereby a Man shall presently be effeminated, and made inept for generation: Wherefore through a preposterous election of places in burning, Patients receive more hurt than good. For the *Japonois* burn neither in the *Hypogastrium*, nor *Epigastrium*, but on each side, a little above and below the Navel; Burning a little above the Navel restores the lost Appetite; so burning the *Os sacrum* on each side, strengthens the genital Parts, diminishes, and sometimes stops the involuntary flux of Seed: The dimple of the Chin, or the middle furrow of the nether Jaw, burnt cures the Tooth-ach: So in *Scalpetus*, you have *Spigelius* his Invention, which advises in the Tooth-ach to cut the Branch of the Soporil Artery that runs behind the Ears to the Teeth, with a Penknife red hot: Various examples also of desired success have taught me the same thing. Besides, the *Japonois* do much commend burning in Dropsies, called the Tympany and *Ascitis*, as also in their endemious Cod-rupture (which is commonly the Swelling of one of their Testicles, very familiar among them) in which they burn the *Scrotum*, and the great Toe of both Feet above the Joint (which is a very sensible place, while it is burnt; but in the whole body there is none more sensible than that between the great Toe and the Toe next it.) And this production of the Vessels (on which this sympathy of Parts depends) must needs be wonderfull to our Countrymen, which is indeed unknown to the *Europeans*, but ratified by manifold experience to the *Chinois* and *Japonois*. Certainly the admirable derivations and divarications of the Bloud-vessels are not yet fully discovered by the *Europeans*; as may be demonstrated from their Schemes. In the violent pain of the Colick (such as rages horribly all *Asia* over, and often kills the Patient with unspeakable Torments, or frequently leaveth a Palsie in the hands and feet behind it) the *Portuguese* use this Remedy; they stand barefoot on a hot Iron (instead whereof I should use *Artemisial* Down, with less pain, and perhaps with more benefit) till the burnt part hiss, and they feel pain, upon which they presently find ease, otherwise they are counted incurable: But, Doth this argue that Wind is the efficient Cause of this Disease, or doth it confirm, the Cure of it should be by Fire? He that against the credit of his Senses doubts whether there be Wind, may be convinced by this Experiment in *Bengala*, where they know in this cruel Disease so to rub and press the Belly, till Wind does sensibly whistle out at the Navel; which, if it do not succeed, they set a great Pot (they call it *Cojang*) full of Water, which by the force and violence of the Wind moves and dances. And (by the way) in this same Disease our Soldiers in *Ceylon* use to take some Wood-ashes out of the Chimney, and mix them with Water and drink them, whereby they find present ease.

Therefore the *Chinois* (of whom the latter borrowed this Art, and whatever else they have in Physick) and the *Japonois* (who practise this Pyrotech-

nick Surgery more than the former) will have the place for burning most accurately observed; both which Nations, although in a manner wholly ignorant of Anatomy; yet they know the motion of the Bloud (on which they ground their whole Art of Physick) and the structure of the Bloud-vessels more exactly, than any Nation in *Europe*. Hence they have formed certain Rules upon burning of places according to the Complexion and disposition of the Humours, and the nature of the subjacent and neighbouring parts (as may be seen in their Schemes.) The burner marks the place with Ink, or some other colour, lest upon motion of the Body, and consequently of the Skin, he mistake: Or he keeps his Patient's Body steady in the same posture till he have done.

And for a Conclusion, let this preparation, and inward use of Mugwort serve; the *Japonois* take its green leaves, not dry, when they have taken out the stalks and fibres of the Leaves, and cast them away, they put the remainder in hot water, they stir it about and wash it, to separate the filth, and take off the bitterness, they pour away the water, and strain it all from the Leaves, these Leaves they pound in a Mortar, when it is enough, they put to it half as much boiled Rice, so with a little Sagar they reduce it to a Paste, and make Cakes of it; which their Women eat instead of Sweet-meats, for fits, suppression of the *Menses*, and Womens Diseases: for which Diseases, that Mugwort is a Specifick, Authours unanimously teach, and the practice of *Japan* doth confirm.

To this it may not be amiss to subjoyn Sir William Temple's experiment of *Moxa* on himself in a Fit of the Gout at the *Hague*. I set the *Moxa* (saith he) just upon the place where the first violence of my pain began, which was the Joint of the great Toe, and where the greatest anger and soreness still continued, notwithstanding the Swelling of my Foot, so that I had never yet in five days been able to stir it, but as it was lifted. Upon the first burning, I found the skin shrink all round the Place; and whether the greater pain of the fire had taken away the sense of a smaller or no, I could not tell; but I thought it less than it was: I burnt it the second time, and upon it observed the skin about it to shrink, and the Swelling to flat yet more than at first. I began to move my Toe, which I had not done before; but I found some remainders of Pain. I burnt it the third time, and observed still the same effects without, but a much greater within; for I stirred the Joint several times at ease; and growing bolder, I set my Foot to the ground without any Pain at all. After this I pursued the method prescribed by the Book, and the Authour's Son at *Utrecht*, and had a bruised Clove of Garlick laid to the place that was burnt, and covered with a large Plaster of *Diapalma*, to keep it fixed there; and when this was done, feeling no more pain, and treading still bolder and firmer upon it, I cut a Slipper to let in my Foot Swelled as it was, and walkt half a dozen turns about the Room, without any Pain or trouble, and much to the surprize of those that were about me, as well as to my own. For though I had reasoned my self before-hand into an opinion of the thing, yet I could not expect such an effect as I found, which seldom reaches to the degree that is promised by the prescribers of any Remedies, whereas this went beyond it, having been applied so late, and the prescription reaching onely to the first attack of the Pain, and before the Part begins to Swell.

For the Pain of the burning it self, the first time it is sharp, so that a Man may be allowed to complain: I resolved I would not, but that I would count to a certain number, as the best measure how long it lasted. I told Sixscore and four, as fast as I could; and when the fire of the *Moxa* was out, all Pain of Burning was over. The second time was not

not near so sharp as the first; and the third a great deal less than the second. The wound was not raw, as I expected, but looked onely scorched and black; and I had rather endure the whole trouble of the operation, than half a quarter of an hours pain in the degree I felt it the first whole night.

After 24 hours I had it opened, and found a great Blister drawn by the Garlick, which I used no more, but had the Blister cut, which run a good deal of water, but filled again by next night; and this continued for 13 days, with onely a Diapalma Plaster upon it; after which time the Blister dried up, and left a Sore about as big as a two pence, which healed, and went away in about a weeks time longer; but I continued to walk every day, and without the least return of Pain, the Swelling still growing less, though it were near six weeks before it was wholly gone. I favoured it all this while more than I needed, upon the common opinion, that walking too much might draw down the Humour; which I have since had reason to conclude a great mistake; and that if I had travelled as much as I could from the first day the Pain left me, the Swelling might have left me too in a much less time.

Sir William gives an account also how the Moxa removed the Pain in a Fit of the Gout, from Monsieur Serinehamps, the Duke of Lorrains Envoy then at the Hague.

Atrophia, or want of Nourishment, or Leanness.

The Contents.

The general way of curing an Atrophy. I.

A particular one cured by Cupping. II.

The Cure of a Spasmodick Atrophy. III.

After Sinapisms Emplasticks should be used. IV.

Medicines.

I. AN Atrophy may be cured, 1. By repairing the general or particular defect of blood, and by using good nourishment, and in due quantity. 2. By correcting any fault in the blood by evacuations of all sorts, and by Alteratives. 3. By repairing the damage any particular part has sustained by mischance.

II. The Ancients had 3 sorts of Instruments to cup withall, of Glass, Brass and Horn; of which the 2 first draw by fire, the last without fire, onely by sucking with the Mouth: Which Horny Cupping-glass, although it be grown out of use among us; yet at this day, the Indians, that live under the Torrid Zone, have a value for it. A young Man that came from thence bestowed such a Cupping Instrument upon me, of which being resolved to make trial, I chose an Arme withered with an Atrophy, to which I applied my Cupping-glass, instead of Pitch and Rosin, which we read, how the eldest Antiquity made use of in the like necessity. Now these Cupping-glasses draw powerfully, and drawing the Skin curiously, they elevate the Veins and Arteries, through leanness fallen flat together: which being opened again, the blood and spirits pass to and fro: whose incessant Affluence, unless it daily supplied the place of those things that are continually spent by the Body, the Part so faulty would not onely not be nourished, but farther it would be emacrated of necessity. For this withering nothing is better than this Horny Cupping-glass: especially if dextrously applied, according to the course of the Veins and

Arteries, that carry life and nourishment thither. I made Experiment in the withered Arme of this young Man, we saw so much Heat and Blood drawn to the outer skin by its sucking, that the dry Arme was again nourished, and recovered its former firength. The way is this; when you have applied this Horny Cupping-glass to the Part, you must suck out the Air with your Mouth at the little hole, and then immediately close it with your finger.

III. A Boy of 11 years old, had from his infancy been troubled oftentimes with a cruel Head-ach for several days together. He was lean, pale-faced, and at length he fell into a perfect Atrophy, with Night-Sweats, and continual roaring, through violent pains of his left shoulder, tending towards his Heart, and the Hypochondrium, on the same side, sometimes pungent, by and by Contractive, or Spasmodick: He had also a desire to Cough, with shortness and difficulty of breathing, whereby the Contractions in his Shoulders and Breast seemed to increase; hereupon he was forced to sit upright in his bed, holding his Shoulder and left Hypochondrium always with his hand, by reason of the continual spasmodick pain. One of his Physicians blamed his Lungs, another his Spleen, most suspected a heftick Fever: At length being brought extreme low, he was successfully cured, with a distilled Water drawn off Chicken Broth, with some leaves of Germander, and Flowers of lesser Centaury (in which there lies an Antispasmodick Virtue, observed by few) and other things. Truly it were not difficult to derive the Rise and Causes of the foresaid Symptomes, according to Willis his Principles, from the enormities of the Animal Spirits and Nervous Juice, without the distempers of the Bowels serving for concoction; which have been blamed by all Men hitherto.

IV. If to draw nourishment to the part, Sinapisms be used, Emplasticks are good after them, left what comes for the use and strength of the Part, do transpire, as also after rubbings and anointings Comfrey Roots boiled in Spring-water is successfully applied to the Parts in form of a Cataplasim.

Medicines especially made use of by eminent Physicians.

1. Swines blood distilled is a singular thing to make one fat. Take of Swines blood 2 pounds, distill it in a Glass in Balneo. Give 2 ounces of this Water with a little Sugar every morning for 15 days.

2. A Water distilled off Swines blood, and cooling and moistning Plants does a wonderfull deal of good. It is made thus; Take of Swines blood 2 pounds, rub it between your hands, that all the Fibres may be taken away, add of the Leaves of Betony, Coltsfoot, Red-Roses, Mallows, each 1 handfull, Lettice 2 handfulls, Melon-seeds excocticated 1 ounce, Coltsfoot Water 2 pounds, Distill them in Balneo by an Alembick: Put to every pound of Water 3 ounces of Manus Christi perlate. Let him drink often of this Water.

3. In an Atrophy of the Limbs Nettle Juice is excellent to anoint the Limbs withall, that are extenuated.

4. The Virtue of this Liqueur is admirable; Take of Mentha Saracenic, Rosemary, small Sage, Flowers of Cheir, Lavender, Lily Convall, Roman Chamemil, Spike, of each equal parts. Bruise them, steep them for a Month in Spirit of Wine; strain them out very hard; keep it, and bathe the Limbs with it.

Things got into the Ear, are to be got out, and not to be left to Nature. IX.

How a Leech was got out of the Ear. X.

General Rules for Cure. XI.

Whether moist things may be used. XII.

How any Liquor may be drawn from the bottom of the Ear. XIII.

Spirituus Waters are to be preferred before Oils. XIV.

I. **W**Hether should we Vomit or Purge in pain of the Ears? A Vomit seems better according to Hippocrates, Aphor. 4. 18. Those pains above the Midriff, which stand in need of Evacuation, require a Vomit. And according to that Precept, lib. de loc. in hom. n. 55. Diseases are to be discharged by the part next to them, and to be drawn out by that part, that hath a passage nearest each of them. In lib. de affect. he expressly commends Vomit. If pain arise in the Ears, it is good to wash in much hot water, and to apply a Fomentation to the Ears, and if by these means the attenuated Phlegm depart from the Head, and the pain cease, these things are sufficient; But if not, a Vomitory Potion is the best Medicine. Where you must observe, that the seat of Phlegm, the cause of the Pain, is above, and so according to Hippocrates said Rules, must be discharged that way. But in his Book de locis in Homine, n. 20. He commends Purging, and condemns Vomiting. If by this means the Pain assuage not, let cooling things, actually cold, be poured in, and let a Potion be given that purges downwards, and not upwards, because a Vomit will do no good. But here you must note, that the Application of cooling things, in this case, argues, that some Hot Humour is in fault, the original seat whereof is below, and that Hippocrates, consonant to himself, purges therefore downwards. And do but you consider the Cause; you have their directions before you.

II. Whether should we apply Repellents? We must listen here to the determination of Aesculapius 9. ad Almansorem. Before Repercussion be made, let these things be observed, The Matter must not have been critically discharged; Not be venomous; Not furious; Not much; Not immediately discharged from the Brain; Not very tough and thick; Not gathered by little and little; Not run to the out-part of the Ear: Because all these things forbid the use of Repellents; besides, to repell to the Brain is very suspicious.

III. Whether must we always use gentle Medicines? The excellence of a most exquisitely sensible part, and its proximity to a principal part, seem to intimate so much: Wherefore Galen, 7. method. doth not cure sensible Parts at once with violent Medicines, but by mild ones by degrees. Yet he, in the violent pains of such parts uses strong Medicines,

lib. 3. 287. 7. as Chalcitis, Nitre, juice of Onions, Goats Urine, &c. that is, when cold and gross humours cause the Pain, which are attenuated and heated by the help of such Medicines, and the Vapours raised by them are dissipated. But he abstains from such things, when the pain is the product of inflammation.

IV. Many Practitioners use Ben. Victorius Faventinus his Plaster of Onions, to assuage the Pain of the Ears, of whatever cause they come, indifferently, to the great damage sometime of the Patient, especially when the Pain is but beginning, and depends on a hot Humour: But when the Pain is owing to a cold cause, or the Inflammation tends to Suppuration, the remedy must be applied with good success. Take an Onion roasted in hot Embers, of fresh Butter 2 drachms, Oil of Chamæmil, Roses, each 1 drachm, Saffron 1 scruple, apply it warm.

Zecchius, consulti. 62.

V. N. was afflicted with an unspeakable Pain in his right Ear, he got no sleep, and was scarce himself: the Humour indeed at first ran, but after the Surgeon applied a Plaster and Clothes to his Ear, the running stopt, but not the Pain. A Physician was called, and advised Opium, upon which he slept two hours, and when he waked, his Pain returned. At length, by my Advice, he took some Pills of Extractum Rudii, & Extractum Rhei, morning and evening four days one after another; he bore the working well, when I had removed the Plasters and Clothes, the Matter began to run plentifully. Then I gave him a gentle Purge of Powder of Jalap 1 scruple, sharpened with 5 grains of its Resin, and so the Patient recovered in three weeks. Another was troubled with a grievous pain in his Ears, his Head ached so, he could not sleep all night, scarce knowing what he did. I advised him to lay aside all externals (the former was my precedent) and presently to take these Pills; Take of Extract of Hellebor made with spirit of Wine, 1 scruple, Pill. Ruffi half a drachm, Resin of Jalap 6 grains, mix them, make Pills for 2 doses. The first Dose gave him four stools, with some alleviation of his Pain. The next day he took the second Dose: It gave him six stools: After Noon his Ear began to run, and when it had continued running fourteen days, the Patient was well. Another was tormented with so grievous a Pain in his right Ear for five or six days, that he was ready to make himself away: Many Topicks were applied without benefit: Three grains of Laudanum were given him every night, upon which he slept with some ease, the Pain returning when the Virtue of the Medicine was expired: After some days a Swelling arose behind the Ear, which being scarified, the Pain changed its proper seat, for it diverted from the Ear to the Loins, from thence to the Kidneys, and at length fixt in the left Knee: The Humour attenuated with Sudorifics, crept to the fleshy substance of the Ear, from the Ear it passed to the Throat; Then matter ran out of the Ear, attended with Swoonings and Death. Therefore any one may gather from the Cases here related, that in this Ail outward Application does more harm than good, and that it is safer to follow Nature's duct, and to purge what way she inclines, than by Topicks to fix that, which seems made for Volatility: Experience also testifies, that in such cases a Physician may do more in one day with internal Specifics, that discuss the matter, than with all Topical Repellents, which hinder the peccant matter, that, when it is disposed to run out, it cannot obtain its end.

Cnosellus; here related, that in this Ail outward Application does more harm than good, and that it is safer to follow Nature's duct, and to purge what way she inclines, than by Topicks to fix that, which seems made for Volatility: Experience also testifies, that in such cases a Physician may do more in one day with internal Specifics, that discuss the matter, than with all Topical Repellents, which hinder the peccant matter, that, when it is disposed to run out, it cannot obtain its end.

VI. Whether is Vinegar, and Oxyrrhodina to be avoided? Vinegar seems hurtfull, because, if according to Hippocrates, it cause very much Pain, it must needs offend the Ears, those Nervous and Bloudless parts, which are drier by far than the Womb. But Galen, 3. 287. 7. disallows not Vinegar mixt with oil of Roses. Moderate Inflammations (he saith) and such as do not heat, may be cured by some such means, as Vinegar and oil of Roses warmed, and well mixt. For Vinegar cools, repels, penetrates and strengthens, by which means

L. 3. Acat. 39.

means it defends the Part from vehement Inflammation. It is true, that by its acrimony it makes the Nervous parts smart, therefore it must not be poured into the Ears alone; but mixt with oil of Roses, and in a small quantity it becomes harmless; and so when its edge is taken off, and its piercing virtue made dull, it mitigates the Pain, and brings down the fierceness of the Cholerick Humour. Besides, Vinegar is not so cold as it is reckoned, when, as Galen confesseth, it consists of contrary faculties, for, by putrefaction it acquires some Heat; and therefore it is not so astringent, nor so cold, as either to prick the Nerves, or thicken and repel the Humours in the Ears.

VII. Galen adviseth Opium to be poured into the Ears; and Paul and others dissolve it in Milk: but if (quoth Avicenna) any hurt follow the use of Narcotics, give Castor alone after it. Concerning this matter Faventinus speaketh thus; And beware of Narcotick Medicines, lest by their stupefying Coldness they destroy the Instrument of Hearing. Nevertheless I would not neglect them, when I were certain, that the Patient would die of the pain, if we gave him not a Narcotick: But because the benefit in delivering the Patient from Death, is greater than the hurt he will receive from Deafness; for this reason we are allowed sometime to give them. Some use Toasted Opium; but if this be never so finely powdered, it will signify little to ease the Pain. Again, whatever is dropt into the Ear, cannot get beyond the Tympane, but if they penetrate not, they can never affect the inner Parts, that are so various, and at such distance: Opium also is peculiarly an Enemy to the Sense of Hearing.

Schneiderus.

Frid. Hoffmannus, m. p. 298.

VIII. Johnston commends the juice of Crow-foot for the breaking of an Imposthume in the Ear; but this should hardly be used, because it is strong and corrosive: But instead thereof we should use the juice of Houseleek with Woman's Milk.

IX. When any extraneous thing is got into the Ear, the business must not be wholly left to Nature; because many dangerous Symptomes use to arise from the Suppuration of these parts: For seeing the passage of the Ear is endued with a most exquisite sense, the Humours, by reason of the vehement pain, may easily flow thither, and so break the Drum, whereupon Deafness follows. Sometime the Bone also, that is covered but with a very thin Membrane, becomes carious after such Suppuration. And sometime after it a fleshy, or schirrous Fungus grows in the passage of the Ear. Therefore we must, with all diligence, get out whatever extraneous thing may come into the Ear.

X. When by chance a Leech had crept into the passage of a Man's Ear, Severinus poured some blood on the out-part of the Ear, whereby the Leech was enticed, and left the Caverns of the Ear.

Fabric. Hil. danus.

Hearnius.

XI. 1. Whatever Medicines are to be put into the Ears, they must be warm, not very hot; nor very cold; for, being void of blood, they easily incline to their natural temperament. 2. New Medicines must not be put in, till the Ear be very well cleansed from the filth of the former. 3. Three or four drops at a time are sufficient. 4. After the Medicine is dropt into the Ear, the Patient must lye on the contrary side. 5. What is put in must not be unctuous, nor viscid, for such things, when they are got into the windings of the Ear, cannot well be got out again, and therefore Spirituous and Distilled Medicines, that are used by way of Evaporation and Fume, are the most proper. 6. Young Surgeons should be admonished, that in curing Diseases of the Ears, they should rather gently drop in some convenient Liquors, than violently force them in by a Syringe, lest the Tympane be broke, and an incurable deafness do follow. 7. Topicks

Sennertus.

must not be applied till Universals have been used, especially if the Disease be grievous, and the body abound with bad juices. 8. We must have a care that the Medicine be not sharp; because the Passage of the Ear is very sensible.

Sculetus. Armam. Tab. 36. Fabric. Hil. dan. Cent. 3. Obs. 1. Idem.

XII. The Ancients abstained from moist things, and such as were cold especially. For Archigenes, when he was to use a Fomentation for the violent pain, uses live Sulphur mixt with Water. Let the Rubens in Spunges (saith he) be well wrung out, and applied to the Ears, for they are easily made loose and lax by moisture. Therefore in Galen Vinegar is often mixt with Medicines for the Ears, at least while they are boiling, not so much for the sake of penetration, but that they may dry the more. But Avicenna saith, Enchirid. Med. pract. 3. When we fear the pain will cause Convulsion, we cannot excuse our selves from the use of Mollifiers. But to cause Suppuration, we must not in the Ears use very moist things, as in Abscesses of other parts; because the cold and dry temperament of the Ear must be preserved.

XIII. You may draw any Liquor, or Matter from the bottom of the Ear, if you dip a Sponge in Betony Water, and strain it out well again, and then put it in the passage of the Ear; and let the Patient lye on his sick side; for so the Sponge will soak up whatever is liquid; but the Sponge must be often changed and washed.

Fabric. Hil. dan.

XIV. A Melancholick Person of about Fifty years of Age, was troubled for some weeks with a grievous tingling in his Ears, and was cured in a few days with a few drops of Spir. cephal. Anhalt. put into them with a little Cotton. I have found the effect of it in strengthening the Brain, and dissolving a Vaporious and flatulent Matter, far beyond distilled Oils, which, by their exceeding heat, doe more hurt.

Thonerus. lib. 2. Obs. ult.

Medicines especially made use of by eminent Physicians.

1. Pound some Galls, bind them in a Rag, boil them in Wine, and pour in some of the Wine hot; it gives present ease. Bayrus, 1. 4. c. 1.
2. I cured one who had a sore Ear 8 years, so that all that time some purulent Matter ran out of the Ear, onely with Unguentum Egyptiacum. J. Wallaus. Med. pr. 2. c. 8.
3. One that had an Imposthume in his Ear, put into it Oil of bitter Almonds, mixt with Mucilage of Linseed; whereupon Matter ran out in great quantity, and so he recovered. Forest. lib. 7. c. 8.
4. Marcellus his Experiment is not to be despised; Mix, saith he, two ounces of Cows Milk with one ounce of Honey, pour some of it in presently, stop the Ear with Wool, and although the Ulcer were Cancrous, it will wonderfully heal. J. Riolan. medic. m. p. m. 135.
5. An excellent old Medicine for the Tingling of the Ears; Take of white Hellebore, Castor, each 2 drachms, Costus 1 drachm and a half, Rue 2 scruples, bitter Almonds 1 ounce, Euphorbium half a drachm; boil them all for an hour on a gentle fire, strain it, and drop it warm into the Ears. Grato. conf. 44.
6. Nitre dissolved in strong Vinegar, and often dropped into the Ears, quickly cures any noise in them. P. J. Fabr. 1. 3. c. 34.
7. The steam of Vinegar with the Gall of an Ox, and the Gall of a Goat with juice of Onion, are found good by Experience for a Noise in the Ears. Sennertus.
8. Worms will fall out by this means; Mix Henbane-seeds with a little Wax, cast it on burning Coals, and let the Patient, by a Funnel, receive the

Arnoldus Villanovan. 1. 1. c. 35.

the Fume into his Ear: Hold a Bason of Water underneath, and you will certainly see the Worms fall into the Water.

Bayrus. l. 4. c. 5. 9. Juice of Shepherds Rod, and Pellitory of the Wall, with a little Black Hellebore presently kills the Worms.

10. *Arculanus in lib. 9. Rhafis*, saith thus; This is a tried Remedy to draw out any thing that is got into the Ears; let a live Lizard, or one but

newly dead, be applied with his head to the Ear, and bound there for three hours, you will find the thing, whatever it be, sticking to the Lizard's head, when you remove it; and this is good to draw out any thing else.

11. A little Ball of Dogs Hair put into the Ear, is good to draw a Flea out of the Ear; for the Flea will presently creep into the Hair, out of Sympathy which it hath with Dogs.

A GUIDE TO The Practical Physician.

BOOK II.

Of Diseases beginning with the Letter B.

Balbuties, or Stuttering.

The Contents.

Stutterers must have their excessive moisture purged cautiously. I.

All do not falter because of the excessive moisture of their Brain. II.

A Medicine.

I. **S**OME Stutterers have their Tongue weakened through the moist intemperature of the whole body, or of the Brain. And they that have a moist Tongue are for the most part loose, the same Membrane being a coat both to the Stomach and to the Tongue. For this reason, when the Tongue trips, it portends a *Diarrhoea*: as if Hippocrates had said, *Such bodies should be purged with caution, lest they be cast into a Looseness.*

II. The disaffection of Lispers consists in Conformation, and not at all in Intemperature: for in the middle region of the Palate, i.e. in the fourth bone of the upper Jaw, in all persons that I have hitherto seen, who could not pronounce the Letter R, there are two holes, which are nothing so open and obvious, as in them that do not Lisp. Therefore those two passages are the immediate Cause, and the Disease will be in Conformation.

¶ In like manner we observe the holes near the Teeth (yet by all such so brought into the World with themselves) to be greater, through which the Phlegm trickling and moistening the tip of the Tongue causeth faltering, whereupon Men become Stammerers, and half-Tongued. Nor therefore must we say, that Men are Stammerers by reason of a Phlegmatick Head, or a moist Intemperature of Brain: For there is no Intemperature so dry, but so much

Phlegm may be gathered, as falling on that part may moisten the Tongue, and make Men Stammer. Sanctorius, Meth. lib. 3. cap. 9.

A Medicine especially made use of by an eminent Physician.

Let the Mouth be often washed with Spirit of Black Cherries; for it greatly strengthens the Muscle of the Tongue, and the innate fixt Spirits of those Parts allotted to Speech. Pet. Joh. Faber. univ. sapientie, l. 3. c. 14.

Brachiorum affectus, or Diseases of the Arms.

The Contents.

Pain of the Arm cured with an easie Medicine. I.
Its Swelling cured, which came upon letting an impure Body bleed. II.

The Cure of it shrunk. III.
Medicines.

I. **A** Goldsmith, who was Scorbutick, was troubled with a violent cutting Pain in his right Arm, so that he could neither eat nor sleep. I prescribed divers things to no purpose, at last the following Bag took the Pain quite away. Take of Grommel not excorticated 3 handfulls, of common Salt one handfull, of Chamæmil Flowers and Wormwood each 1 handfull, of Bran 2 handfulls; heat them upon a Tile, put them in a Bag, and apply them hot. Ger. Christ. Wincklerus, Misc. curios. an. 96. obs. 94.

II. A

Hearnus, comm. in aphor. 32. Sect. 6.

II. A Man above Fifty years old, who was cacochymick, and subject to great obstructions in his Bowels, had, without either Purging his Body, or advising with a Physician, and when he had no occasion to bleed, got himself let blood in the Cephalick of the right Arm, the next day he had some small pain about the place of incision, which gradually encreasing, and growing more violent, a great afflux of serous Humours did follow. When I was called, I found his whole Arm incredibly swelled, from his shoulder to his fingers ends; there was an Inflammation with Pustules, as in a pustulous Ring-worm, out of which a serous and sharp Humour ran in abundance; he was restless, his stomach and strength were gone, he was in a Fever, and in much pain, and that not without fear of a Gangrene. Notwithstanding I undertook the Cure in this manner; When I had put him in a right course of Diet, I gave him a stool (for he was constive) with a Suppository: After Supper I gave him a little Laudanum, with Cinnamon Water, and *Confectio Alkermes*: The day following I gave him an Infusion of Rhubarb, Agarick and Senna, with a few drachms of *Elect. Diacarth.* But that Potion scarce wrought at all; the next day therefore I gave him a drachm of *Pil. Coch. & de Hermodactyl.* with a few grains of Trochiscs of *Albandal & Diagrydium*: I applied to his Arm things to assuage the Pain, maintain the native heat, consume excrementitious Humours, and to resist Putrefaction: Then I made use of an opening Apozeme for several days, and when at set times I had purged him with our lenitive Phlegmagogue, and with Hydrogogues, he was perfectly restored. Hence it appears, how dangerous it is to move any thing in bodies that are impure and full of ill Humours: Wherefore *Galen* was in the right, that Wounds should be judged dangerous, not onely for the Excellence of the Part affected, or for their greatness; but for the impurity and cacochymy of the Patient: for we often see most grievous and deadly Diseases do arise from the least wound, nay, from a little worm; while the Humours flow from the whole body to the part that is hurt, as to their common sink, and so destroy the innate heat of that part, and excite various symptoms.

Fabricius
Hildanus,
Cent. 4. Obs.
71.

III. A Person of Quality about five and forty years old had his Arm shrunk; He took an Extract of *Grana Acanthalidis*, and Pulp of *Coloquintida* for fifteen days, by means whereof the Humours that were gathered there, were dissolved and expelled; In the mean time the part was outwardly fomented with this Decoction; Take of Mallows, Violets, Calamint, Chamæmil, Melilot, each 1 handfull; Let them be boiled with a Neats-foot in Water and Wine.

P. Poterius,
Cent. 1. curat.
79.

Medicines especially made use of by eminent Physicians.

1. A certain person, when he had anointed his Arm that ached, with the Juice of the Root of Devil's-bit, was presently eased of his pain. ¶ Some who have had violent pain in their *Periosteum*, especially at night, have reaped much benefit from the Oil of Earth-worms, and of a Fox. You may first apply *Aqua Vite*, after that Fox Oil alone, and last of all you may anoint with Dogs-grease as hot as you can by the fire.

Pet. Forest.
l. 29. obs. 28.

2. I have often experienced this Plaster to doe a great deal of good; Take of pure Gummi *Caranna* 1 ounce and an half, of *Tacamabac* 3 ounces, of *Ammoniac* and *Galbanum* dissolved in Vinegar, each half an ounce; *Bdellium* 6 drachms, yellow Amber 1 ounce, Mastick, Frankincense, each half an ounce; Turpentine and Wax each what is sufficient. Spread it on Leather, and apply it to the part grieved. It must be used for three weeks or a month.

Bronchocele, or the Throat-Rupture.

The Contents.

It hath not one onely Cause, nor Cure. I.
One ceasing, when the Swelling broke of it self. II.
By Application of an actual Cautey. III.
Caution must be used in cutting of it out. IV.
If Medicines prove ineffectual, we must have recourse to Incision, or a Seton. V.
Medicines. (See Strumæ.)

I. *Celsus* defines *Bronchocele* to be, A Swelling in the neck, betwixt the skin and the *Aspera Arteria*, wherein sometimes dull flesh, sometimes some Humour like Water or Honey is contained. *Platerus* makes the cause to be Wind breaking in under the skin, and the general Membrane under, and adhering to the skin, in the forepart of the neck: But the cause of that Aërial Collection he makes to be the loosening or separation of the skin with its Membrane (which is thicker and redder in that place than elsewhere) from the seat of the *Aspera Arteria*, and fore-Muscles of the Neck, into which space, when made, the Air or Wind, to avoid a vacuum, breaks in, and not onely by filling it raises the skin and Membrane into a Tumour, but by continuance distending it, much encreaseth it, whence it is rightly called *Bronchocele*, as if it were a Rupture of the Throat: And he makes the cause of the separation of the Membranes to be violent straining, either in going to stool, or in labour in Women. There is truth in both opinions, although *Sennertus* thinks it scarce probable, that Wind alone can procure so lasting an evil. ¶ I saw an example of the first kind, Anno 1660. in my own Maid, *Petronella Definod*, a faithfull servant, who died of a Consumption and Dropsie in her Brest and Belly: In the process of her Disease she had a huge Throat-Rupture, which had disfigured her Neck for ten years: I ordered the Swelling to be opened with a Razor; there was underneath glandulous flesh, swimming in great store of purulent Matter, which had flowed thither from the Brest and Lungs. ¶ I had an example of the latter kind in a noble Matron, who, upon her straining in Travel, and holding her Breath, contracted that Ail on a sudden: She went with it two years, but at length it dispersed of it self, without any Medicines or remainder of it behind. ¶ That driers may properly be prescribed for this Disease, the example of a Small-coal-man in Geneva doth shew, whose Neck was beset with one of these Swellings as big as his head: but by his continual stirring in, and carrying of Coals, and by inspiration of the Dust, he obtained a perfect Cure; and, at this very time, his Dewlaps hang at his Neck, as upon an Ox. *Arnoldus de Villa nova* his Powder is very Efficacious, and deserves commendation, while the Disease is new; Take of Sea-Sponge, *Pila marina*, Pepper long and black, Ginger, Cinnamon, *Sal Gem*, Pellitory of Spain, Galls, Sponges, *Bedegar*, each 1 drachm, pound them all together, except the Sea Sponge, which must be burnt, and its ashes mixt with the rest, and sieced; let him hold a little of this frequently in his mouth, both night and day, he may take a little of it often in a day. ¶ Amongst topical Medicines this of *Ætius* discuffeth, which hath, Of Quick-lime, Gum-Ammoniac, *Bdellium*, Shells burnt in an Oven, Verdigrisee, live Sulphur, each alike quantities, mix them up with Vinegar, and then make them up with Sewet, or Turpentine, and apply it. ¶ Also *Unguentum Valesii* is good; Take of Euphorbium 1 ounce, Sulphur, Sandarach, each half an ounce, Wax and Oil as much as is sufficient. Make it into an Unguent, with which anoint the Neck, and apply the Plaster above prescribed: For (saith he) in good ones of a years standing, we wrought by way of Resolution, as we said but

G 2

now,

now, and thereby we had honour, and obtained benefit.

II. One called Blandin had his neck wonderfully swelled with the Throat-Rupture; upon it there grew a painfull Tubercle, which being brought to Suppuration by Steven Dentand, a skilfull Surgeon of Geneva, and it running good matter for several days, the Swelling wholly fell, without a Relapse.

III. A Collier importunately dunned a Smith as he was turning a hot sharp Iron on his Anvil, for Money for a sack of Coals which he had bought of him. The Smith being earnest at his work, after several threatnings, if he gave him any farther disturbance, told him, he would run his Iron into his swollen Throat. Notwithstanding the Collier urges him, whereupon the Smith enraged, runs the red-hot Iron through his Swelling. The Collier drops, and the Smith secures himself by his heels; but the Collier being carefully looked after, recovered both of his Burning and Swelling.

IV. We may question whether the matter of the Throat-Rupture be contained between the broad Muscle and the skin, or lye hid under the broad Muscle; for the matter gathered here cannot be got out, because insinuated into the Spaces of the Muscles: If it lye without, it may be cured and rooted out: It uses to begin from Wind, that distends and separates the skin from the fleshy Membrane, or the broad Muscle it self is separated from the parts under it.

V. But if the Disease will not give way to Medicines (among which *Ætius* commends *Edellium* mixt with Honey; and Quick-lime mixt with Hog's Lard; Goat's dung dissolved in Vinegar; Ly well mixt with Honey, &c.) by *Rogerus* his Counsel, two Setons are to be applied, that the Humour may by degrees run out, and what remains, must, by little and little be consumed with eroding Medicines, as with Powder of Affodils, and the like. In fine, if it be not implicated with the Veins, Arteries and Nerves, it must, with its Bladder, be taken out by Incision, as we have said of the Glands, and as we have done three or four times. ¶ But if it is not cured by these things, nor dissolved, then we must come to putrefactive and eating Medicines: For, as *Galen* saith, *14. Artis parvæ*. The Cure of the Throat-Rupture is performed either by dissolvers, putrefiers, or by Surgery, namely the Knife. And it is said there, that because Putrefiers and Corrosives are a long time in working, are troublesome to the parts, and especially torment the weak; Therefore it is good to cut them as far as the skin, and (if it can be done) to draw them out bag and all, and if any of the Bag remain, then to apply Corrosives (*Butter of Antimony* is excellent for this purpose) and Putrefiers, afterwards Mundifiers, Sarcoticks, and things to heal the Wound must be applied: But the skin, with the adjoining Coat, is eaten away by Causticks, which being done, if it be an Humour it runs out, if any thing thicker, it is drawn out with the fingers, then the Sore is healed with Lintments. ¶ But this Cure is half Chirurgical, and threatens danger of a *Fistula*. But the Cure which is performed by Surgery, by drawing out the Matter contained in the Tumour by Incision, is shorter, but more difficult, and rarely hath a good issue: But *Rogerus* bids two Setons be made with a red hot Iron, one length-way of the Swelling, the other a cross, and that they be removed twice a day, till all the Matter be got out. But this seems rather to have place (according to *Valescus*) when some Warrish Matter is contained in a Bag, or some other Phlegmatick Matter which can run. ¶ I saw, Anno 1663. a Throat-Rupture, which threatned Suffocation by its bulk, through compression, and straitning the Wind-pipe of Captain *Rolin's* Wife, a *Newenburger*, diminished by help of a Seton, which I advised to be made in the lower part of her Swelling.

Bubo, or a Swelling of the Glands in the Groin or Armpit.

The Contents.

Digesters should be strong. I.
Maturation better than Digestion. II.
The way of curing a pestilent one. III.
Mercurial Ointment is dangerous. IV.
Dispersing or opening is not necessary in every one. V.
A safe Method of Cure. VI.
In a Venereal one, whether, and what Vein should be brea-
thed. VII.
It must be cured by Suppuration, and not by Dispersing. VIII.
It must be opened in time. IX.
Emplastrum de Vigo cum Mercurio is hurtfull. X.
Defensatives must be made use of about a malignant one. XI.
How a simple one may be distinguished from one malignant. XII.
Medicines.

I. WE must observe, that what Digesters we use, must be stronger than in other Inflammations, seeing the Glands are colder, and more ignoble parts, and have no exquisite sense.

II. If the Tumour digest not, it must be turned into Pus, and the Bubo must be ripened; which is generally the safest way: For except this be done, as I have often observed, after a little time a new Bubo usually rises, either in the same, or in some other part.

III. The Physicians of Zurich in Switzerland published a Book of the Plague, wherein they propose a way to cure a pestilent Bubo never till then in use, viz. to take up the skin under the Bubo with a pair of Nippers, or with ones fingers, run a red hot Needle through it, and put some root of black Hellebore in the hole. I had rather make the hole with a good cutting Needle, than with one red hot.

IV. There are some that anoint their Body with Ointment of Quicksilver, not knowing, that it being cold and moist, must drive back calamitous infection of the Venome with the Humours, and bring death to the infected Inwards, as I have observed hath happened in several. *Sigonius*, D. M. using this Remedy for himself, to digest a pestilent Bubo in his Groin, presently perceived his strength to fail, and shortly, as his Bubo disappeared, he died.

V. Some pestilent Buboes, when they would yield to no Remedies, at last we left them to Nature, especially seeing they created the Patients no trouble in their walking, nor pain, nor indangered life. Nor indeed do I think it necessary to open all such Tumours, seeing Nature, in a long tract of time, can best digest them: When, on the contrary, the hazard of an incurable Ulcer may be run by unseasonable and violent opening: Yet these things should be managed with great judgment, as the nature of the thing shall require.

VI. Pestilential Buboes should, if possible, be discussed, and if they cannot be discussed, they must be brought to ripening and suppuration. Now the cure is to be performed by the same Medicines, wherewith the Swellings of the conglobated Glands are usually cured, always with respect to the pestilent poison, for whose sake Treacle, Mithridate and the like, which are good for it, ought ever to be added to other things. To this purpose distilled Oil of Hartshorn, and other things, consisting of a volatile oily Salt, may be mixt with common Medicines. I have observed that *Unguentum Martiatum* mixt with Treacle, is excellent for dispersing, and that *Emplast. Diachyl. cum Gummi*, promotes Suppuration. Unless the violence of the Pain be urgent, I would not precipitately use Scarification of the Buboes, much less Blistering and Cupping: But when the Buboes are great and burning, and the Patients strength firm, I could allow Cupping and Scarifying, but never Blistering,

Blistering, from which I could never yet apprehend what good could be expected, or did ever follow: For the pain which is then increased, together with the great heat, and a kind of *Erysipelas*, can doe the Patients no good, who are already sufficiently weakened with the violence of the Disease. But by gentle Medicines, outwardly applied, the sharpness of the Humour is qualified, when there is any in the *Buboes*, the Cure at least is promoted by degrees, if so be that things convenient inwardly be not neglected, by which the Discussion, as well as Suppuration of the *Buboes* may not a little be promoted: As soon as the *Buboes* are suppured, the opening of them must be hastened, either with a Penknife, or some breaking Medicine, though I prefer a Penknife; after the *Bubo* was opened, I have put in, with good success, *Balsamus Sulphuris Terebinthinatus & Anisatus*, with Unguent. *Basilicon*, and Treacle: for by this means I quickly cleansed the Ulcer: Moreover, by means of this same Balsam it heals up more happily and quickly, if you apply but a little *Emplastrum Diapompholig*, or some such like to hasten the Cicatrice. ¶ I use to treat a Pestilential *Bubo* in the manner following; At the very first I clap on a Vescicatory, although the Tumour be of no considerable bigness, and neglect Cupping-glasses, which I therefore reject, because they cause pain and a Fever, draw out the good Humours as well as the bad, and do yet alter the whole blood more: Within 7 or 8 hours I cut the Blister, and apply *Emplastrum magneticum arsenicale*: Certainly its virtue is such in this case, that I know not a more noble Medicine, as will appear to any one that uses it: The Description of it is in *Hartman*. I have experienced these good qualities in it, that if it be applied to a hard skin, it produces not the least Eschar, and in the mean time draws out the Malignant Humours so egregiously, that a *Bubo*, as big as a Walnut, is taken away in four or five days time: But this does not always succeed so quickly, and this is the reason why a Blister must be first drawn, that the Humours may the sooner be evacuated. Nay, in robust Bodies it will produce no Eschar, unless by help of a Vescicatory, not onely the Cuticle, but some part of the skin also be first corroded: But in children, and more tender bodies, it is able to raise a Scab of it self, without any blistering premised. This Scab is the true seat of the extracted Poison, wherefore it is found pretty thick, and the skin onely superficially corroded, which is a thing truly worth consideration: For this, as I think, is the reason, why this is sooner separated than any other Scabs raised by Art; for in 24 or 36 hours it hath fallen off, by the help onely of a *Spatula*, without any precedent Scarification. It may be taken away without any, or but a very little pain, if to your Antipestilential Plaster, whatever you use, you add a little Unguent. *Basilic*. or Treacle. Otherwise this Unguent excellently promotes the falling of the Eschar. Take of Virgin Honey, Ducks grease, each 1 ounce, Soot 6 drachms, Stratsburg Turpentine 1 ounce, Yolks of Eggs No ij. Treacle 3 drachms, Oil of Scorpions what is sufficient. Mix them and make an Unguent. But if when the first Scab is fallen, the Tumour be not sufficiently abated, you may raise a second and a third with *Emplastrum Magneticum Arsenicale*, and then proceed as you did before. You may heal up the Ulcer with *Emplastrum de Minio*, or some other drying and cicatrizing Plaster; but do not make too much haste to heal it, lest the Poisonous Humour still remaining in the Body should cause a new Disease, or Death at last.

Franc. Sylvius de le Boë, Appen. ad Prax. Traët. 2. Sect. 677.

Barbette, Traët. de Pe. ste. p. m. 191.

VII. If there be a Venereal *Bubo* in the groin, you must not bleed in the Arm; For there would be danger, lest the morbidick matter should be drawn upwards. I have known some, who just upon the appearing of the *Bubo*, after letting of blood and Purging, have fallen into a stubborn Pox, if not perpetual. But if the *Bubo* give no hope of Suppuration,

and several days have past, and the Pain and Swelling do not encrease, then you may safely let blood below; for the matter is drawn downwards, and by the approach of hotter blood to the *Bubo*, sometimes it is easily suppured. But when you have used Suppurators a long time, if the thing succeed not according to your desire, then you may freely breathe a Vein in the Arm.

VIII. In the same, since the Humours want violence of motion, there is no necessity of Revulsion, but it is rather better to draw all the Humour to the place affected; as in pestilential ones, that all the force of the poison may expire by the *Bubo*: for when it is otherwise, more grievous Symptoms and Diseases spring up. Which is the reason that I have always perswaded my self, they are in a grievous error who try to dissolve them; for although it be a safer way of evacuation, yet in this case it is the cause of much mischief; seeing, in dissolving them, that matter onely vanisheth, which is contained within the *Bubo*. Whence it comes to pass, when nothing of the peccant matter in the whole body, and especially in the parts about the Liver, and in the Liver it self, is diminished (as is usual in suppured *Buboes*, by which the matter of the whole body runs out, and is purged away, so that then the Body is more purified) that the matter left within causeth falling of the hair, Pustules, Sore heads, and grievous Pains. For which reason I reckon it most advisable to endeavour suppuration in all these, as a present remedy for this worst of Diseases.

IX. *Buboes* that are caused by thick, tough and cold Humours, are ripened with difficulty, and require a long time to cure: For sometimes when Nature is not strong enough to drive such matter to the outer skin, it remains between the *Peritonæum* and the Muscles, hence it continually sends Vapours to the Liver, sometimes it causes large *Sinus's*, and divers symptoms, for the matter polluted with this Infection returns to the Liver, and infects the mass of Blood, and other parts. ¶ A certain person had a *Bubo* in his right groin, who deferred opening of it, till the malignant matter fell upon the fourth and biggest Nerve of all that move the Hip; whereupon there was violent and continual pain in the Hip, attended with Convulsions, a continual Fever, &c. after that there was great Leanness and Weakness. Many things both inward and outward were tried, but in vain; for the *Bubo* did scarce appear outwardly, onely the Groin was hard; there was no pain almost; for the violence of that in the Hip had stunned it. At last the *Bubo* was broken by help of a Caustick, out of which, in six or seven days time, there ran above Ten pounds of Matter: And he difficultly escaped by help of the *Pep-per Bath*.

X. They that use *Emplastrum de Ranis cum Mercurio*, are most impudent and audacious Asses in this Art, for they drive the Venome inwards, and greatly endanger their Patient, as both Writers and Experience do clearly inform us.

XI. If there be suspicion of a Malignant *Bubo* from its green colour, or blackness and inflammation, such as come of Melancholy turn'd into black, thick and rebellious choler, so that from its more plentiful influx into the part, there be danger of a Gangrene and Mortification; then the places round about the Abscess must be defended with Repellers, but the Abscess it self not at all.

XII. *Buboes*, as they rise from blood, stagnating in the conglobated Glands, and tending to Inflammation, so as a saline or acid Acrimony is joyned with the blood, they shew their peculiar malignity. From Phlegm joyned with the blood *Buboes* rise more Oedematous; from common Bile, more like an *Erysipelas*; but from an austere humour more hard and schirrous: from a corroding Acrimony malignant ones;

Epiphanius Ferdinandus Histor. 17.

Mercatus, de indicat. Med. l. 1. c. 4.

Hildanus, cent. 5. obs. 65.

Barbette, Traët. de pe. ste.

Parvus, l. 21. c. 31.

ones; which Acrimony notwithstanding is often allayed, both by the blood it self, and by Phlegm mixt with it; wherefore the malignity and Acrimony can seldom be deduced from the *Buboes* alone, but from other Symptomes usually accompanying them, and in the Plague indeed from Carbuncles and black Spots; but in the Pox, from the *Gonorrhoea*, cancrus Ulcers of the Genitals, &c. Therefore *Buboes* alone, since they never are the diagnostick signs of a Pox alone, neither from them alone can its Essence be derived, but from other Symptomes accompanying them. Except some will have Venereal *Buboes* not to be extended length-ways the thigh, but athwart, and that they resemble the Site of the Spermatick Vessels, as some do teach, in which thing notwithstanding I think they pronounce more out of prejudice, than from accurate observation, while they imagine that different Glands are affected in the Plague, and in the Pox: except may be it happen, that seeing there are many Glands about the Groin, in the Pox those especially be affected, that are nearer the Spermatick Vessels, whether the *Preparantia*, or the *Deferentia* are: Afterwards the Poison rises through them, and insinuates it self partly into the whole mass of blood, and partly into the parts adjoining, and so into the Glands themselves, and infects them.

1. Balsam of Sulphur is an excellent Remedy for *Buboes*.
2. Emplastr. dia Sulphur. Rulandi, is highly commend- ed for promoting of Suppuration.
3. In a cold *Bubo* I use this Plaster among my Se- crets; Take of Linfeed Meal 2 pounds, of old Cheese mashed 1 pound, mix them, let them boil in a suffi- cient quantity of the Decoction of the bones of an Hog's Legs, make a Plaster and apply it.
4. I have often found the benefit of a Vescatory of *Cantharides* in a pestilential *Bubo*, for it draws the Poison to the out-parts. Take of Sowre Leven 1 ounce, *Cantharides* finely powdered No xx. Treacle, Mithridate, each 1 scruple. Mix them, make a Cataplasm, and apply it four or five inches be- low the *Bubo*.
5. If a Sapphire be leisurely drawn round a pe- stilential *Bubo*, drawing it round against the Sun or the Light, then there will be a black Circle, by which the Poison exhales forth. And they use to bind it on, and draw it about for half a quarter of an hour, then it suffers not the Poison to spread beyond the Circle, but it grows black round it, and being dried to an Eschar it will fall off.
6. A certain Physician applied this thing follow- ing with great success to get out the Poison. Take of *Diachyl. compos.* 1 ounce and an half, of roasted Oni- ons, roasted Garlick, each 2 ounces; Figs, No xx. Le- ven, Mustard-seed, each half an ounce, root of Mal- low, Marsh-mallow each 1 ounce, *Galbanum*, Gummi Ammoniack dissolved in Vinegar, each 3 drachms, Ointment of Marsh-mallows 1 ounce and an half. Mix them.
7. They easily dissolve and vanish away, either of themselves, or by anointing with a Man's fasting spittle, or oil of Scorpions.
8. In a Malignant *Bubo* we must apply *Diachylum cum gummi*, and black Sope, whereby I have seen most stubborn *Buboes* suppured.

Bubonocèle, or Groin Rupture.

The Contents.

- One impatient of a Groin-Rupture, taking it for a Venereal one. I.
The Gut must be put up betime. II.
A mortal one. III.
Whether a Maid cured of a Rupture, if she Marry, will prove barren? IV.
Medicines. (See Hernia.)

I. A Country Man labouring under a Groin- Rupture, went to a Barber-Surgeon, who taking it for a Venereal *Bubo*, perswaded him to have it opened, which the poor wretch consented to, and when the Excrements came out, he presently fell in a Swoon: I being called, presently put the Gut back with my finger, having applied the White of an Egg with Dragons-blood, and then making some compression with a Linnen-cloth four double, I bound it pretty strait for four days, then I used A- quapendents Cerecloth for the Rupture; and the cut parts grew together in ten days.

Marchetti,
Observat. 55.

II. A Matron Forty years old, subject to a Rup- ture for several years, when the Gut had slipped into the cavity of the Groin, which it had made, and she did not presently put it back, began to be pain- ed, afterwards she Vomited, and went not to stool; all this while concealing the cause, that is, falling out of the Gut, at last she brought up her Excre- ments at her Mouth. I being called the Sixteenth day of her Disease, and inquiring the cause, found a hard and painfull Swelling, as big as ones Fist, in her right Groin. I foretold the Disease would be mortal, because some part of the Gut was cor- rupted. It's true, by the help of Fomentations the Gut was put back, and much Excrements discharg- ed, and also a piece of the half rotten Intestine, about a finger long, whereupon the Patient found ease; yet the next day, which was the Nineteenth of her Disease, she died. The Cure might have been easie, if the cause of her Disease had been known to her Physician at first; but her imprudent Modesty was the cause of her Death. Except this woman, it was never my hap to know another die of a Rupture: for the part affected in Women does not easily ad- mit any large Dilatation, or Sinus to be made by the Gut, as it does in Men.

Fabricius
Hildanus,
cent. 6. Ob-
servat. 37.

III. A Woman Forty years old, formerly my Pa- tient; after carrying a heavy Pail full of Water, complained of a pain in her Groin. This was fol- lowed with a Groin-Rupture on the left side, which, in a short time after, having broken the skin, burst out, whereat all the food she took, and Worms, came out. When the Wound was healed, the Rup- ture remained, the Pain in her Belly continued, and she was troubled with Wind continually, especially when she lay down, the Guts then returning in- ward. She thought her Belly was full of little Ani- mals, courting this way and that; But, by handling her, I perceived this her torment was owing to Wind, which proceeded from some days Obstruc- tions; she Vomited also every Morning. When she had taken a Clyster, the Obstruction removed, and her pain asswaged; yet at certain times an appa- rent Swelling returned, with a rumbling: When it hid it self in her Belly, and she had a rumbling, she was much tormented: but when it came out in a great lump, she was free from torment. Before the Gut could conveniently be put back, and the future mischiefs provided against, I ordered, that when she had broke the Wind, which distended her Guts, the Excrements, the fuel of putrefaction, should be Purged out, the Worms should be killed and brought away, with Remedies proper for this Pest. But

Bartholinus,
cent. 1. hist.
3.

But while the Remedies were delayed, the poor Woman died of the violence of her Pain.

IV. It is Queried, Whether a Maid 22 years old, Marriageable, of a middle stature, of a good habit of Body, if she should Marry, would she be Barren, by reason of a Rupture in her Groin, but well cured? And, if she be not Barren, Whether for the same reason she would not be in great danger in her Travel? It seems to me, that for that Reason alone she will not be Barren, because an Incision there comes neither to the Womb, nor to its neck, nor to any part deputed to Generation, as is evident

from *Aetius*, l. 16. c. 103. Therefore, since in such an Operation the foresaid parts are not hurt, nothing hinders but she may conceive. And since the Cicatrice in a Girl 13 years old, at which time she was cured of her Rupture, is long since grown together, and well cured; it will not break; and by consequence, when she has conceived, she will be in no danger for this in her Labor. This is clear, not from Reason alone, but from Experience likewise; for such Women have both Conceived, Gone with, and happily Brought forth Children without any danger.

Pet. Forestus, l. 26. c. 6.

A GUIDE TO The Practical Physician.

ses. III.

Purging hurtfull. IV.

In a Melancholick one we must Purge frequently. V.

The use of Spaws. VI.

For whom Sweating is proper. VII.

A Cachexy caused by the fault of the Kidneys. VIII.

From the fault of the Lymphatick Vessels. IX.

A White Dropfie from anointing with Mercury, cured by U-
rine. X.

Medicines.

I. **L**ETTING Bloud with a Lancet may sometimes be proper in those Cachexies, where there is an obstruction of the Liver, and a Plenitude, because perhaps the bloud being so in motion, and that quick-
ned, some of the corrupt Humours in the Vessels of the Liver will come out with the bloud: But especially if there be a Cacochymie in the bloud, it will be convenient to draw it out. ¶ The opening the Hæmorrhoids, as it is a Revulsion by the Mefaraick Veins, will be very good against obstructions of the Liver, Spleen and Mefaraick Veins; so also as it draws out the Cacochymie gathered there.

II. Letting bloud is sometimes necessary for a Cachexy: Which I experienced in my self, when after a Quartan Ague I was so far gone in a Cachexy, that I was sore afraid of a Dropfie. And certainly I was cured by no other means than by frequent bloud-letting, so that in ten days time I let my self bloud five times; at first the bloud came out exceeding foul, at last very pure, which was the conclusion of my bloud-letting. I have tried it in several others.

Botallus, lib.
de curat. per
S. M.

III. Physicians proceed amiss in curing the Cachexy of several persons, while at the very first they endeavour to promote the stopped Months, by letting bloud in the Foot, without any preparation of the Humours, or clearing the obstructed passages: For Nature discharges not the bloud by the Veins of the Womb, till the innate Heat have recovered its former Vigour, and Crudities be in a great measure consumed, which being done, we may proceed to bleed in the Foot, and to give Medicines to promote the Menses. And for the most part it falls out, when Crudities are concocted, and the Oeconomy of the whole body restored, that what Natural Evacuati-
ons were suppressed, do then return of them-
selves.

Enchirid.
Med. Pract.

IV. We should not give Purgatives to Cachectick persons; because it is most certain they hurt the Liver, and weaken the Ferment of the Bile: But we should give Lenitives repeated, equal to them; for a weak Agent reiterated is able to doe as much as a strong one can doe at once, and with less danger. ¶ I find our Physicians often commit this Error, insomuch that they abstain not from most violent Purgers in Cachectick persons, and so bring those bodies, that should have lived longer, to an untimely end. ¶ Some sick persons will Purge almost every day, because of some small alleviation they find thereby: But this is very bad for them, and they die in a short time; for it is very sure the bowels are exceedingly hurt thereby.

Freder. Hof-
mannus, m.
m. l. 1. c. 7.

Idem, l. 2.
c. 6.

V. Seeing

V. Seeing a thick and feculent Melancholick humour turns not easily into Sweat, more frequent Purging is necessary in this Cachexy than in a Phlegmatick one: for this may without the help of Catharticks be almost all concocted and consumed with drying Medicines: But the Melancholick Mud gathered in the Veins or Arteries of the Spleen, as by degrees it is concocted, so it must gradually be taken away by Catharticks.

VI. A certain great Drinker had so inflamed his Liver, that continually, even while he was fasting, or but just late to table, before he had scarce eaten one mouthfull, he was forced to drink, which I have observed in several to be a certain sign of a Dropsie coming upon them from the too great drought of the Liver, depending upon the heat; some fore-runners whereof I saw in his cachectick face. Because he desired to drink the Spaw-waters (for he refused other Medicines) he fetched them sometimes from *Griesbach*, where the Well is, and kept them at home, and according to my advice, when he had over heated himself with Wine, he accustomed himself to drink of them, to quench his preternatural thirst, which the Wine had caused. I gave him leave to go to the Wells, and to drink the Waters, as others use to doe. After this manner the use of the Spaws did both him good and others that laboured of the like intemperature of Liver; which the Vulgar abuse, thinking them to be good in most desperate Diseases, and drinking them by Quarts, whereby the natural Parts and nervous Kind (for which sharp things are bad) are hurt; besides, they are very bad for the Breast, and therefore for all that are troubled with a Cough and Shortness of breath. Sometimes I have prepared artificial Spaw-waters, which I have given for a Cachexy, and they have done good. ¶ The drinking of natural Vitriolick Spaw-waters continued for some Weeks, is very good to correct the Heat of the Liver, if it be used in time, before the Dropsie invade a man, and the Water be gathered in the Legs and Belly: for when it already falls out of the Veins, by reason they encrease its store, they will doe no more good, but will rather encrease the Swelling in the Dropsie, especially if (as they usually then do) they piss but little, and yet in the meantime drink much, which therefore, I have observed, hath hurt a great many people.

VII. Sweating with a Decoction of *Gualacum* in a Stove or in Bed cures a Cachexy. But in a Cholerick one you must sweat in a Stove, with a gentle heat: In a Melancholick one with a little more intense: And in a Phlegmatick one with a most intense Heat, that is, as great as the Patient can endure without fainting. This Cure is proper for such a Cachexy as happens to Maids or Women from Grief, eating of crude things or drinking cold liquours, but not for elder persons in whom it is bred by the use of strong Wine, Hippocras, Muscadell, Salt and peppered Meats, and such heating and drying things: for since in this case the Liver is exceeding hot and dry, and that there is great store of the Atrabilarious humour in the first and second region, that is, in the Veins of the Liver, Spleen, Mesentery, and in the greater Veins and Arteries, Bathes are more proper than a Stove, for a hot and dry Liver requires to be moistened, and not to be dried: And an Atrabilarious humour is but enraged and irritated by using hot things and profusion of Sweat.

VIII. It is worth observation, that a Cachexy in persons troubled with the Stone in the Kidneys, has had its original from an Ulcer in the Kidneys, when the purulent matter by reason of the obstruction in the Ureters regurgitating into the Kidneys, and infecting the Blood, hath infected the whole habit of Body.

IX. It often falls out, that a Man's Body becomes swollen, turgid and languid; and then the ti-

morourfulness of the Physician, grounded on no reason, predicts danger: But they may very properly be cured in a short time by Sudorificks used internally and externally. The cause of this Evil hath not its rise from the Intemperature or weakness of those parts, that the Ancients called *Noble*: Besides, it may easily be distinguished from the Dropsie; which the said parts do cause; for although the Patients be very sluggish and lazy, yet they are oppressed with no anxiety of heart, they breathe freely and from an open Breast, and their Belly swells not much: The watry matter is gathered first in the face and limbs, and if the tumid parts be prest with your finger, experience will shew that the parts are not so full as in a true Dropsie; wherefore some that are ignorant of the true cause, ascribe this Swelling to Wind. The Lymphatick Vessels being compressed, broke, or some other way obstructed, so that the natural motion of the *Lympha* is hindered, do cause the Ail.

X. When *N.* who was troubled with the Pox and a Water Rupture had been cured of both his Diseases by anointing with Mercury; after the same example he ordered one *Aldr. de Aldrichetti*; a strong Woman of a full Age, that was swollen with the White Dropsie, to be likewise anointed: She made much Urine without any Salivation; yet she felt a little pain in her Neck, and perfectly recovered.

Medicines especially made use of by eminent Physicians.

1. In an inveterate Cachexy I anointed the Belly and Feet which were swollen more than ordinary; with the following Liniment: Take of the tops of green Dwarf-elder; green Cranes-bill, Sauce alone, Flowers of Roman Chamæmil each 2 ounces, fresh Butter 1 pound, let them boil well. Strain them out and add of distilled Oil of Tartar rectified, Oil of Wax well rectified, Oil of Caroways rectified, each 3 drachms. Mix them and make a Liniment, to be used as above said. And take of this Cordial often every day: Take of Cinnamon-water 3 ounces, Oxymel of Squills prepared according to *Zotser* 2 ounces, Spirit of Vitriol dephlegmed 24 grains. Mix them for use. This water, which I always kept as a secret, was wonderfully commended by all people.

2. The Essence of *Crocus Martis* and a Mixture of it, do in curing a Cachexy excell all other Remedies.

3. The Water distilled off fresh Walnut-tree roots cut into little square pieces, steeped in Whitewine 24 hours, sweetened with Sugar-candy and exposed to the Sun for some days, taken in 3 ounces weight using exercise after it, cures the Green-sickness in Maids.

4. Take of the finest filings of Steel 1 ounce, *secula Ari* 1 drachm and an half, Ambergryse half a drachm, Essence of Coral, of Pearl each half a drachm, Amber prepared, Cinnamon each 4 scruples, Sugar what is sufficient. Mix them, and make a Powder. It is the best remedy for pale and depraved colours, as for Cachexies in Women, Men, Maids younger or elder; if the body be prepared and purged 15 days before, one after another. I have had admirable experience of this Powder in curing all Cachexies.

5. Chalybeate Salt is very good for a Cachexy.

6. When the Body is purged, Wormwood taken any way is excellent good to strengthen the Stomach and Liver, and absterge the humours. And this is a good Powder; Take filings of Steel, sprinkle them with water of Wormwood or Ash, wherein their Salts have been dissolved; leave them so long till they contract rust; Take of this *Crocus* 3 ounces, burnt Harts-horn prepared half an ounce, Magistery of Coral, of Pearl each 1 drachm and an half, Cinnamon, Crystals of Tartar 1 drachm, Sugar what is sufficient to sweeten the whole; Make a Powder.

Schroderus.

The dose 1 drachm. And this Chalybeate Wine is good, especially in a pertinacious obstruction of the Bowells, and suppression of the *Menses*, whence a Cachexy ariseth. Take of filings of Steel 3 ounces and an half, White-wine 4 pounds, infuse them in a Glas 8 days in the Sun or some hot place, shaking it often every day. Let the Patient take 4 or 6 ounces of this Wine two hours before dinner, shaking the Glas, and when he hath taken it, let him walk for two hours, if he be able. As often as you pour out one glass, you must pour in another, till half the Steel seem spent, then you must add no more.

Sennettus.

Calculus Renum, or the Stone in the Kidneys.

The Contents.

Signs and the Nature of the Stone. I. a.
 What Vein should be breathed? I. b.
 When a Purge should be given? II.
 Whether Cassia be proper? III.
 Diureticks should not be added to Purgers for prevention. IV.
 Whether strong Purgers be convenient? V.
 Of what things Anodyne Clysters should be made? VI.
 Whether their Quantity must be small? VII.
 Whether a Vomit may be given? VIII.
 When Diureticks may be given? IX.
 They must not be mixt with Food. X.
 The Qualities of Lithontripicks. XI.
 We must begin with the milder. XII.
 The use of them must be continued. XIII.
 They must not be too hot. XIV.
 Their Abuse must be avoided. XV.
 The way of making them up. XVI.
 Whether Spirit of Turpentine be proper? XVII.
 Attenuatives are not always proper. XVIII.
 What must be done next, when the Stone is got out of the Kidneys? XIX.
 Stone in the Kidneys, accompanied with vomiting of blood, cured. XX.
 If accompanied with pissing of blood, what must be done? XXI.
 Lenient and mollient Clysters are very good. XXII.
 Whether Asses milk be good? XXIII.
 Whether it may be given one in an actual consumption? XXIV.
 Whether Pease-pottage may be given? XXV.
 The use of Astringents does good. XXVI.
 We should rather cool the Liver than Kidneys. XXVII.
 Coolers, especially in old men, often doe harm. XXVIII.
 Outward Coolers are of no use to some. XXIX.
 In prevention Bathing suspicious. XXX.
 What such Diet should be used? XXXI.
 A Draught of warm Water before Meal is good for prevention. XXXII.
 The turning of the Stone into the Gout is safe. XXXIII.
 Whether Nephrectomy be possible? XXXIV.
 Stone in the Kidneys mistaken to be the Colick. XXXV.
 Medicines.
 I. a. Gravel not subsiding in the Urine, but sticking to the sides of the Chamber-pot, signifies not a calculous disposition, but exceeding heat of the Liver. Spigellius saith, he hath sometimes found the blood in the Veins full of small Gravel. Nor does the subsiding Gravel necessarily indicate the Stone, but sometimes the material cause onely of the Stone, (for many that are free from the Stone do make Gravel) yet it intimates a disposition to the Stone. When Gravel that used to appear is afterwards suppressed, and pain is felt, and the Urine white and thin, it is a sign the Gravel is concreted into a Stone; and when it is made with pain and strangury, it is a sign of the Stone. ¶ Gravel that is bred in the Veins is mixt with the Urine and with the Sediment. But what is in the Kidneys, U-

Plempius, in Insitius.

Epiphanius, Ferdinandus.

reters and Bladder, presently resides as the Urine is made. ¶ Gravel frequently proceeds from adustion of the humours, which is bred in the Liver and Veins, and sticks to the sides of the Glas, nor does it sink to the bottom, as that which comes from the Kidneys. Besides, it breaks with rubbing in ones fingers, and appears of a Saline Substance, whereas the other neither yields to the fingers, nor can it any way be dissolved. And finally, because this Gravel hath a Saline Substance, it is dissolved in warm Urine, and no way appears in it while it is yet hot; but when the Urine is cold, it coagulates and sticks to the sides of the Urinal, just as Crystals of Tartar, which are dissolved in hot Water, do, when it is cold, coagulate and stick to the sides of the Vessel. So that the nature of this Gravel and Crystals of Tartar is very like. Riverius.

I. b. Hippocrates, 6. Epid. and in his Book *Of the nature of Bones*, orders bleeding in the Ham. Galen, on the contrary, 6 Aphorism, 36. advises bleeding in the Arm, if there be a Plethora, and violent pain, and the Disease be new, and he advises well: For if the humours flow from the whole body to the Kidneys, such a Remedy must be chosen as may make a Revulsion from thence; such as Bleeding in the parts above: If the Disease be inveterate, or bleeding in the Arm have preceded, then it is proper to bleed in the Ham. Leeches also applied to the Seat are very good, according to Aphorism 6. 10.

II. We must diligently take notice, that a Purge must not be given till the Pain be something asswaged: For even a strong Cathartick given while the Pain is violent, often does not purge, because at that time all the parts contract themselves, and do not assist the Medicine. Riverius, Præf. l. 14.

III. Some commend Cassia for the Stone; but I would caution the careful Physician, that some have found themselves exceeding ill upon using it, and have encreased their Disease: One complained to me, that heat of Urine always followed the taking of it. ¶ Petrus Pigray, l. 7. c. 4. writes, that Cassia agrees very ill with those that are troubled with the Stone. ¶ Two ounces and a half of Cassia given one in a continual Fever raised such a flux of Urine, that for three days together he made his Urine so hot, that every time he made it, he thought a red hot Wire had been drawn through his yard. Fabr. Hildanus, l. de Lithot. c. ult.

IV. Nephritick persons should have some familiar Medicine, that may help them to a Stool. For those who are loose and troubled with Fluxes, have not the Stone and Gravel; provided notwithstanding the Purges be not made up with Diureticks. I speak this, because at this present there are several who use Receipts that purge both by Stool and Urine. When there is mention made of Medicines to divert the Matter, there is no need of a Diuretick: Wherefore they doe very ill who in time of Prevention and for Revulsion's sake do use Cassia; for Cassia is both purgative and diuretick, therefore not to be used in diverting the Matter, and I look on Valeriola to be of this opinion, 6. Enarrat. Saxonia, loco cit.

V. In the Stone in the Kidneys although Hippocrates order violent Medicines, such as Spurge, to move the Stone; yet I think it safer to use Lenients, that may onely dilate the parts, then more violent ones, which perchance may draw greater plenty of humours to the Parts affected; Wherefore as in prevention we must use gentle Medicines, so I think we must use the same in the Cure. Mercatus, de Præf. l. 1. c. 6.

VI. Crato consil. 136. prefers the simple Decoction of Speedwell before all more generous inward Medicines for the Stone. The use (saith he) of a Clyster made of the Decoction onely of Speedwell with Sugar will doe more good than any Medicines taken by the mouth. You may put in the Decoction some fat of a Loin of Mutton, of a Rabbit, or a Capon, that so it may make smooth; if you can get none of these, you may take some fresh Butter. Therefore young Physicians may take notice, that a great Medley of many Simples is not always necessary to make a Clyster.

a Clyster. I can safely attest, my Patients have often found more benefit and ease in the Colick or Stone from a simple Clyster of Milk and Sugar, in which after *Crato's* example I boiled either Speedwell or Chamæmil-flowers, not Roman, but the common, that is more temperate than the Roman; than from Clysters of more ample furniture, made of Pennyroyal, wild Marjoram, Rue, Calamint, &c. Because these hot things by discussing do raise Wind, whereupon the Pain encreaseth, which is mitigated with Anodynes properly so called.

S. Pauli,
Quadrif.
p. 512.

Zecchius,
Consult. 50.

VII. We must take notice, that in Nephritick Pains Clysters must be given in less quantity than in other Distempers, lest the Quantity by distending the Intestines press the affected parts circumjacent, and exasperate the Pain.

VIII. Whether is a Vomit proper in this Disease? There are many young Physicians, who commend it for prevention, to expell the tartarous matter, before it be derived either to the Reins or Bladder: Some admit it in the very fit; because Nature seems to shew the way by reaching and vomit. *Hippocrates* saith, 6. *Epidem.* that men are better after eruginous Vomit. In my Judgment Vomit conduces by straining to the expulsion of the Stone or Gravel, as it does to the Delivery of a Woman, namely, by the violent commotion of the whole Body, and compression of the Muscles of the Belly. But we must take diligent heed, lest a Vomit be given to all persons without distinction of those that cannot bear one, and so Disease be added to Disease. *Severinus* advised me to this Remedy for a pain in my Bladder, but, I was very near a Pleurisie upon it. Mr. N. by his prescription took the Antimonial Wine, with great success, and lived very healthy after it.

Tho. Bartho-
linus, Cent.
1. Epist. 55.

IX. As Diureticks in the Cure of this Disease are fit and necessary to get the Gravel and Stone out of the Kidneys; so for prevention and in time of Health, we must abstain from them, lest while they provoke Urine they by use open those ways, and make a Passage to the Kidneys, whereby all the crude and bad humours that are bred in the body may tend thither, and afford matter to breed Gravel and the Stone. ¶ I warn my Patient that he carefully abstain from diuretick Medicines, and such as expell the Stone; for unless this be done, he will be certainly troubled with the Stone. ¶ They that in calculous persons use hot Diureticks, commit a mistake; because such Medicines bring filthy matter with them, and open the Passages: Secondly, they displace the Stone, and make it unequal and rough. Lest the Reins or Bladder should be hurt by the asperity of the Stone, Sagacious and Prudent Nature hath clothed it with a mucous and slippery Phlegm, lest it should pinch the live part. Diureticks do much harm, because they strip the Stone that was covered with viscid Phlegm, which by reason of its raggedness doth so prick, that in a short time it causes a mortal Ulcer, attended with cruel Symptoms. A certain Mountebank gave a Wretch troubled with the Stone most violent Diureticks, which caused exceeding dreggy Urine, the viscid Phlegm being scraped off, which was as a bed to the Stone: He presently felt himself better; but in a little time, the Stone being naked and sharp, ate and pierced through the sides of the Bladder, upon which there presently came an Ulcer, and that a Gangrenous one; and I never saw a man die so violent a Death.

X. In the Stone both of the Reins and Bladder, Diureticks to break the Stone must be given a long time after meat, and on an empty Stomach, and if it may be done, after the body is purged; for Diureticks are quickly carried to the Kidneys, and they drag along with them the Food crude and in-cooked, so they rather load the Reins and Bladder, and encrease the matter of the Stone. Therefore they doe very ill, that boil Parsly-roots or some other Diuretick with their meat and eat it for their Dinner or Supper:

Frid. Hof-
mannus,
m. m. l. 1.
c. 18.

XI. All Stones, at least those that I have yet found, are dissolved in the acid Spirit of Nitre, whence I conclude none can imagine that the coagulation of Stones, can proceed from an acid; therefore from something contrary to it. Now if a man do but consider the various things that promote the concretion of natural things, he will find the virtue lie in austere things, upon which score they give glutinosity and toughness to Fluids; to which if the earthy and saline volatile parts be joined, something not unlike the Stone will arise. Therefore I incline to the opinion, that the earthy matter, and saline volatile joined with the glutinous do by the help of the austere humour grow into a stone: But the virtue of the coagulating Austere is infringed by the sharp Acid, such as is found in the Spirit of Nitre. ¶ When larger Gravel comes away, and sinks to the bottom of the Urine, and is laying the Rudiments and Growth of a Stone, we must beside volatile oily Salts use things that dissolve the Stone, among which we deservedly ascribe the first place to Spirit of Nitre, seeing in it Stones are so easily and so manifestly dissolved and broken. And the Spirit of Nitre may conveniently be dropt into ones common drink, Beer, Wine, Broths, &c. to make them a little sharp, and so be used a considerable time, whose excellent Effect all will admire. ¶ Diureticks to break the Stone must, 1. Be apt to turn to Urine, to wit, (as *Helmont* saith) that they may touch the place affected. 2. They must have power to dissolve the Stone. 3. They must possess it in a specific Propriety. 4. They must be subtil, that they may spread every way. 5. They must be amicable to nature, lest they destroy all. 6. They must not be very hot. You should rather give such things as consist of an absterive virtue from a volatile Alkali and an acid, and that by their gentle sharpness do incide and cleanse the filth of the urinary passages, as also by their sweet fragrancy affecting the Reins do hinder the dregginess of the Ferment, and so prevent all occasion of the Stone. Such things also are good as asswaging the Pain of the Kidneys, do better fit them to expell what is hurtfull, such as Saffron, and Cassia and Rheubarb deprived of their purgative Faculty. ¶ I will relate what I have observed concerning Spirit of Vitriol in the Stone of the Kidney and Bladder. Diureticks are of two kinds, one aperitive, and the other incisive. Aperitives draw the matter to the Kidneys, and therefore if these be affected, are very suspicious, because we draw the matter to the part affected: But Incisives carry not the matter to the Kidneys, but onely by inciding subtilize, and so the matter being made subtil passes the Kidneys. Hence it is (and I ever use it with success) that if in the beginning I give Spirit of Vitriol to break the Stone or cut the gross humour, I quickly see a happy Issue. And the Spirit of Vitriol, though it be diuretick, yet it onely incides, upon which subtiliation while the matter passes out, the Urine appears more copious, and it is truly a Diuretick by accident, not that it carries ought to the Kidneys, but because the matter, when it hath no impediment, finds an easie passage. And that is attempted in vain after the third or fourth day, which may be done the first, without which the Pain is prolonged three or four days to the great damage of the Patient; for then we must stay for universal Evacuation, which in this case is not necessary in the beginning, but may very conveniently be celebrated when the Pain is over.

XII. Of which Diureticks nevertheless distinction must be made, that in the first place the milder be used, and the more temperate, before we arrive at the sharper, which do enflame the Arteries of the Liver and Reins.

XIII. In the use of Medicines that break and expell the Stone, we must take notice that they must not be used once or twice onely, but oftner, till the obstructed passages be opened: And while they

are given, the Reins and Bladder must be fomented with Baths, Fomentations, Unctions and Cataplasms, that they may work the better: And also some liquours, that are of thin parts, such as vinous White-wine, must be given now and then, and internal Emollients, Laxatives and Smoothers of the passages must be made use of, that the ways may be open, and the acrimony of other Medicines may be qualified.

Riverius.

XIV. Medicines that attenuate the Stone without violent heat, conduce much to health: for the hotter sort of things consume the finer parts, and leaving the grosser do harden the Stone, and draw new matter to the Reins and Bladder from the whole Body: Therefore rather let them be of tenuious parts and cold.

Heurnius.

XV. Some in the retention and interception of the Stone in the Ureters do commend the Powder called *Pulvis Lithontribos* and some stronger things, which before purging the whole body do drive many bad humours from above to the Kidneys, whereby the Stone is not only firmer fastened in the Ureters; but internal Inflammations are also bred, and Death it self follows, which I have tried.

Fabelius Hildanus.

XVI. *Gainerius* hath taken notice, that we must observe first to join piercing Remedies with those for the Stone, as Cinnamon, Nutmeg. 2. To add such a thing as may strengthen the virtues of the Medicine, to the end they may play upon the Stone with their whole strength, as Maffick and Gum. 3. That they have fineness of parts to pass the better. 4. Something that takes off acrimony may be added, as Roses, Liquorish, Linseed.

Heurnius.

XVII. Whether is Spirit of Turpentine proper for the Stone in the Kidneys? It is good, for it is a dispersing Medicine, penetrates deep, and hath an excellent virtue in purifying the Bowels, dissolving gathered Tartar, and discharging it by Urine; yet lenitive Purgers should be made use of before we come to the continual and daily use of it: Although in the use of Turpentine it self in substance this is not requisite, because it hath it self a purgative virtue, especially when it is mixt with powdered Rheubarb, according to *Crato's* description in *Scholtzius*, *cons.* 152. It helps by its temperate heat, whereby it befriends the parts destined to concoction, for which reason it is good for those that are troubled with the Stone, as it helps concoction, that so the peccant matter may the better be separated from the Blood. You may see in *Amatus*, *cent.* 1. *curat.* 63. the History of a Monk who every morning for several months swallowed a piece of Turpentine as big as a Nut fasting, and was so cured of the Stone and Gout, when other Medicines would do no good.

Gr. Horstius, Probl. Dec. 1. 8. q. 1.

XVIII. They are in error, who always use attenuating and inciding Medicines, as if there could be no Gravel without a fulness of gross humours, and as if there were not some very cholerick persons to be found who have their blood and other humours very thin, and are troubled with the Stone. For I am of the opinion that there is no one living, but hath so much grossness of humours, that, if it stay in the Kidneys, may cause the Stone: And that there is so much Phlegm in a man that is not phlegmatick, as may make up one Stone.

Sanctorius, Meth. 1. 3. c. 7.

XIX. When the Stone is voided, although all danger be over; yet I use for two or three days following to procure a perfect absterion and cleansing of the Reins, by giving a *Bolus* of our Turpentine washed in Mallow-water with Liquorish powder, and drinking upon it an Emulsion of Melon-seeds, made with Mallow or Barley water, but very thin.

Fortis, cons. 96. cent. 3.

XX. A certain person fell into grievous pain in his left side under the bastard Ribs, attended with vomiting much Blood, as often as he stooped it returned upon him, so that he grew very weak upon it. Dr. *Mabius* judged there was some large Stone lodged in the left *Hypochondrium*, and that by moving

it the Blood was extravasated in so great quantity, powred into the Stomach, and then vomited up. He durst not prescribe things to force the Stone, lest when the Vessels were unstopt, they should open wider, and by farther vomiting of Blood his life might be endangered: Therefore he gave him calcined Harts horn for several days in some fresh broth: He ordered the pained part to be fomented with Mallow leaves, Chamæmil flowers and Linseed boiled. And so his Vomiting ceased, the Stone was moved to his back, and then to his bladder, it stuck in the neck of the Bladder, and put him to cruel pain. Then he gave his anodyne Salt in a decoction of Mallows: he ordered Mallow leaves and Linseed boiled in Milk to be often applied to his Loins and Privities, anointing his Privities with oil of white Lintree. And so within 6 hours he voided a Stone as big as a Bean, and the Patient, through God's Mercy, was restored.

Frid. Hofmann, m. m. p. 253.

XXI. If in the Stone of the Kidneys the Patient piss much Blood and often, and so two contrary medical Intentions do continue, the case will be hazardous; for it is the most difficult thing to find a Remedy in the Art, which will perform opposite operations, namely, open and bind, break and close: And therefore, setting aside all other things, we must presently have recourse to the Remedy by *Aristotle* called *Sacred*, namely, the Bath-waters, wherein the vitrioline virtue is most eminent, than which no safer or better Remedy can be thought or used in the present case. For such Waters expell violently and efficaciously, and therefore are lithontriptick, and upon score of the Vitriol staunch blood; besides that in strengthening all the Inwards, they very much cool the Liver and Reins.

Fortis, cons. 95. cent. 3.

XXII. In the cure of the Stone many examples teach us, that much caution is necessary: For strong Diureticks do not only encrease the Pain, the Stone being violently moved, and not removed; but they cause pissing of blood, excoriate the urinary passages, and sometimes impact the Stones into the narrow passages; nay, and raise Convulsions and Epilepsies, while the Stone is violently driven in, and not driven quite out, as I have observed. Therefore we have eased those of their pains that have had large Stones in their Bladder, only by lenient and emollient Clysters, so that for several years they have lived without any evident trouble in fits of the Stone. And no wonder, since emollient and abstergent Clysters do bring away the mucous matter always in a manner joined with the Stone, and clear the urinary passages of Obstructions: they bring away Gravel also, and make way for the Urine. Some years ago I experienced this in my self, when I was troubled with a most violent pain in my left flank, I discussed it only by taking three mollient Clysters in one day, the Gravel being loosened, and the viscous thick matter joined with it scoured likewise, and brought away with the Urine for several days together. And by these gentle means so much was done in cleansing the urinary passages, that from that time to this I never fell into any such pain.

Oethzus, apud Skenchidam.

XXIII. There are some that think that Asses Milk is good for People troubled with the Stone, because, in that it exceeds all sorts of Milk in subtilty and serousness, it possesseth rather an opening than a stopping faculty: But if in Bodies prepared for it, the Stone be bred of Cheese; If all Milk consist of three substances, Cheese, Whey and Butter, and therefore whatever things participate of Cheese, they do retain this faculty more or less, according as the caseous substance abounds more or less in them: the Consequent is, that the Stone may be bred by the use of Asses Milk, though not so easily as by a thicker sort. However a Milk of much Serum does the Bowels sometimes more good by reason of its serous substance, whereby it deterges, than by its caseous substance hurt, whereby it should obstruct: nay, it cures

cores obstructions, as frequently it happens in the milk of Camels that have newly foaled, which is very good for a Dropsie, as *Avicenna*, l. 2. c. 442. saith. But this happens to their Milk upon account of their Pasture; for Camels feed upon Spurge, Widow-wail and the like, from which the Milk acquires a purgative faculty, and by reason of the *Serum* very detergent. Now Womans Milk and Asses are exceeding like, and both of them moderately partake of Cheese. That Woman's Milk breeds the Stone, *Galen*, lib. 6. *Epid. Sect. 3. com. 15.* and *Avicenna*, lib. 3. *fen. 18. tr. 2. c. 16.* do shew. *Galen* indeed 6. de *sanit. tuend.* allows Asses Milk to the calculus; but then it is for preservation, and for the removal of those inconveniences, which the Stone, while it is expelled, usually leaves in the body, that is, of an Ulcer in the parts which serve for expulsion of Urine, these being exulcerated by the ragged substance, or greatness of the Stone in its passage; and of the dry-temperature introduced by an extenuating diet, watching, vacuation and pain: Asses Milk corrects this by moistening, cooling and nourishing; it cures the Ulcer by cleansing, mitigating pain, and by glutination: *Ætius* allows of it; but after cutting in the neck of the bladder, and that the Stone is got out. See him, *cap. 5, 8 & 10. lib. 11.* And I say, that Asses Milk of it self cannot deterge and expell Gravel: because *Serum* does not purge the Reins and Bladder on its own account, seeing this office belongs properly to Diuretick Medicines: But by accident it may, that is, given in great quantity, whereby running by the Urinary passages, it may carry with it all manner of Excrementitious Humours it finds in its way, if so be it pass by way of Urine, and be not kept in the body; for if it be kept, and be not purged out by the Urinary passages, it cannot do any good. There might be also another way of giving it, that is, mixt with Diureticks, as the Ancients used.

Gr. Vir. Aug.
genius, tom.
1. lib. 2.
Epist. 1.

XXIV. If the Patient be consumptive, and there be an Indication to break or diminish the Stone, Asses Milk cannot be convenient, because it neither breaks nor diminishes the Stone. Nor can the extirpation of the Stone, and the cure of the consumptive-body concur in this *Materia Medica*; for the Consumption requires the Milk to be kept a long time in the body, that it may moisten, cherish and refresh all the solid parts: But the Stone requires it to be expelled much sooner by the Urinary passages, because, if detained, it would cause grievous inconveniences.

Id. m. ibid.

XXV. For those that are troubled with the Stone in the Kidneys, Broths may be made of Pease, and seasoned with Anniseeds, Fenilseeds, Juniper Berries, &c. And that the pains of some Nephritick persons are exasperated by such Broths, and others on the contrary are preserved by them, neither of these matters wants a Reason. For we must know that they onely are ill after eating of Pease Pottage, whose Pelvis of their Kidneys is beset with the Stone, covered with a slimy Mucus, which while the Pease Pottage does as it were rub off by its absterging Quality, these sharp stones prick the Ureters, whence comes grief and other symptomes, which draw the sixth pair of Nerves of the Brain into sympathy. So likewise even Turpentine it self, than which there is not a better Medicine against the Stone and difficulties of Urine (even those which the filthy Pox causeth) sometimes does encrease nephritick pains. But this Pease Pottage doth preserve others from nephritick symptomes, and those especially who have not a slimy, viscid and tough mucus turned into Stone in the Kidneys, or those from whom it forces gravel or little stones, the Kidneys not being Ulcerous. And thus not onely both these sorts of people, but all in general may be secure from the flatulency of the Pease.

S. Pauli 2^{us}.
dript.
Botan. p.
435.

XXVI. *Trallianus* approves of Myrtle to evacuate the Stone: Yet it may be questioned what way we

may safely use this Adstringent Medicine to expell the Stone. It consists of contrary faculties; for it does not onely bind, but hath also something of Acrimony in it by reason of its tenuious and hot parts. This is the reason why *Dioscorides* saith, that Myrtle provokes Urine. In the mean time we must note, that Astringents are used against the Stone and difficulty of Urine, both joyn'd with diureticks, that these may the longer be detained in the Kidneys: and sometime by themselves alone, that strength may be added to the weak Kidneys. ¶ I have heard from great Practitioners, that most men suffer this torture for their flaccid reins; hereupon Astringents came in use, as Syrup of Lemons with Water of the herb Horsetail, &c. ¶ Seeing none but hot Kidneys breed the Stone, and that they are much weakened by strong Diureticks, it is no wonder if by the use of the Brier Sponge, called *Bede-gar*, the Reins be strengthened, and thereby more fit to expell the Stone. ¶ If in the cure of the Stone we could well distinguish Medicines, we should have fewer troubled with it. For they that perpetually use Diureticks, properly so called, especially the first ways not cleansed, when they have thus brought the calculous matter to the Part affected, they make that which is ill worse. How much better do they that once every quarter in the year do scowre the first ways, as they call them, and then they take Almond-Milk for several days, And for the Cure, before all things they purge gently, afterwards they use Diureticks, improperly so called, that is, cold ones, which restore the tone to the Kidneys, as Syrup of Lemons, Chamæmil, &c. with the Water of Sloe-flowers, Strawberry, Violet, Mallow common and Marsh, Horsetail, Toadflax, Plantain, &c. some of which are astringent, and not diuretick: others are diuretick onely for their watry substance.

XXVII. Where we must note, that cooling Cataplasms and Inunctions should be applied to the Liver before the Kidneys, when the heat of the Kidneys proceeds from it; or when some strange Salt, bred by the digestion of the Liver, hath crept, by means of the bloud, into the Kidneys, then this being inclosed, and because not vital, troublesome to the *Archæus*, in process of time grows hot: hence proceeds this heat of the Kidneys.

Frid. Hof-
mannus, m.
m. 4. l. c.
12.

XXVIII. Empiricks are in an error, that cool miserable nephritick old men, who are deprived of heat, giving them Spaw-waters, and Whey; because they believe, excess of Heat must necessarily concur to the production of the Stone, and they urge, that heat must necessarily be a mean to dissolve the thin parts, and leave the gross. But a moderate heat is able in process of time to harden and condense the clammy matter that is settled, as is evident from *Galen*, 6. *Epid. 3. 15.* Heat, saith he, if it be but moderate, is sufficient to harden this matter, seeing in warm Waters that spring of themselves, though but a little warmer than ordinary, tophi are seen to grow. So Stones grow in the bladder, which is far colder than the Kidneys, both by reason of its nervous substance, and of the Cavity, into which, after making of water the air gets, lest there should be a Vacuum.

Sanctorius,
meth. vii.
err. l. 3. c. 7.

XXIX. Outward Coolers applied to the Kidneys in fat and fleshy Bodies are of no use, because their virtue cannot reach the part affected, and by onely condensing the outer parts they are apt to encrease the heat inwardly.

Fortis.

XXX. There are some that prescribe a Bath of sweet Water, which I have ever suspected, as too much loosening: Instead whereof the Reins should be anointed with Unguent. Rosæ, Mesues, and *Infrigidans Galeni*, and Water-Lily-leaves applied to them.

Idem consult.
98. cent. 3.

XXXI. In meat and drink, seeing thence the matter of Gravel and Stone takes its beginning, that we may prevent breeding of it; Moderation must be used, and the food we eat must be of good juice, but

but we should especially accustom our selves to temperate Meats, and therefore we must seldom and sparingly use salt-meats; for it is a principal Rule in the Cure to abstain altogether from very salt things, as also from the earthy and dry, since from such the matter of this earthiness does arise; and from very sharp and hot things, seeing by the Gravel compacted into a Stone, the Kidneys are heated and dried. And therefore we are rather solicitous in prohibiting all salt and spiced meats, than crude and clammy ones, and such as are accounted to breed phlegm: seeing these do indeed breed a thick juice, which creates obstructions; but they cannot be converted into an earthy matter, unless some other earthy matter be mixt with them.

Platerus.

Zecchius,
consul. 13.

XXXII. This must never slip your memory, that nothing is better to bring away the Stone in the Kidneys than warm Water, or Chicken, or Veal, or Mutton Broth, if four or five ounces be drunk pretty warm immediately before meat, morning and evening. ¶ That the great heat of the Kidneys may be remitted, which is as the efficient cause of the Stone's returning, I commend the taking of boiled fair Water, to the quantity of six or seven ounces, before every meal, twice, or at least once a day: for nothing renders the Kidneys so free from Recrements, and so temperate. And their fiery heat is at length extinguished with the warm Water, that they can never after breed a Stone.

Idem consul.
17.

XXXIII. It is my advice, that when other things do no good, the Matter be retracted to the Joints: for the turning of the Stone into the Gout is most easie, and of this into that, and it is less dangerous to be troubled with the Gout than with the Stone: for the Gout pain never endangereth Life by its trouble; but the Stone in the Kidneys and Bladder, by their many Agonies, and those incessant, kill the miserable Patients. Therefore the matter must be diverted to the Limbs by Frictions, frequent Bathings, hot Inunctions, Sinapisms and Blisters.

Saxonia
Pract. c. 36.

XXXIV. Cutting for the Stone in the Kidneys is indicated by Hippocrates, lib. de intern. affect. l. 15. But when it swells, and bunches out, about this time you may cut upon the Kidney, and when you have taken out the Pus, you may cure the Gravel with Medicines that provoke Urine. Whence it is manifest, that cutting for the Stone in the Kidneys was known to the Ancients. Avicenna also makes mention of it, but with Bacchanellus I think it impossible, because way must be made through the Muscles, through the Back, through the great Bones, through the Nerves and Arteries and great Veins. I think this cutting can then onely be administered, when according to Hippocrates, the Kidney is swollen and elevated, or when it is suppurated: for in this case Nature prepares a way for her self, and those that have been so cut have recovered, as Schenckius out of Celsus relates, &c. And I also observed it in a young man, from whom two Stones with matter came out, through an Abscess in the Loins, that opened of it self: but in any other case I believe it altogether impossible. It were an excellent thing if it could be done with safety; but no man is obliged to impossibilities. But if this be done by Nature, May it therefore be done by Art?

Dom. Pan-
rol, Pen-
ult. observ.
42.

I Answer, that many things are done aright by Nature, which in no wise can be done by Art; We have an example in Hydropick persons, in whose Legs, if Ulcers arise of themselves, Health appears; but if they be made by Art, they corrupt, and death follows. Ambrosius Paræus, in his Chirurg. magn. lib. 24. c. 16. relates, how a Nobleman of Mantua, who was troubled with the Stone in the Kidneys, was condemned to be beheaded; but at the request of the Physicians in Paris, with the Magistrate's leave, he was cut, the Stone taken out, the wound healed, he cured, and this was his punishment. But if this operation be performed in the Loins right against the Kidneys, it is joyned with great and imminent danger, because by that way you must come

at it through the Muscles of the back, the Nerves, the Aorta and Vena cava, with hazard of fainting and death. Which if it be tried to be done by the flank, and by drawing the guts on one side, way be made to the Kidney, although indeed there be less danger in this (as *Roussetus de partu caesareo* observes) yet the conflux of the blood into the Cavity of the Abdomen is not without some, and a Cicatrice in the Kidney is very difficult, so that for these causes, it is either not to be attempted at all, or at least with the prognostick of death premised.

Ben. Sylvati-
cus, cent. 3.
consul. 55.

XXXV. I knew a certain Woman, whom several Physicians affirmed to be troubled with the Colick: But I at the first visit (because she was very numb, and there were other signs of the Stone) judged it to be the Stone, which nevertheless they said was false for several reasons. So I was discharged, and they persevered in the Cure, and continually gave her hot and dry things, till she changed life for death. When her body was opened, a great Stone was found in her Kidney, and I regained my credit.

Gerardus
Bergensis, de
aric. & re-
num morb.
curat.

Medicines especially made use of by eminent Physicians.

1. The following Medicine speedily brings away the Stone by Urine. Take 7 cloves of Garlick, 9 grains of Pepper: bruise them small, give them to drink at once with old Wine in the Bath.

Ætius Te-
trabi.

2. This Powder breaks the Stone wonderfully. Take of the seeds of Marsh-mallow, Violets, Mal-low, each 5 grains, of Gromel, Liquorish-root, each half a scruple, of *Lapis Judaicus* and *Spongæ* each 3 grains, of the powder of the stones of Dates, Cher-ries and Medlars each 1 scruple, Melon Seed half a drachm. Make a Powder. The dose is 1 drachm in 2 ounces of small White-wine, or *Oxymel*, or in 3 ounces of a Decoction made of Elecampane in Water and a little Vinegar.

Joh. de Al-
tomari, de
med. hum.
corp. malis
c. 54.

3. I have cured almost 600 of the Stone in the Kidneys by the following Syrup. Take of the Roots of Saxifrage, Butchers-broom, Lovage, *Eringo*, Rest-harrow, Anise, Fenil, Parsly, Grass, each half an ounce, Horse-Radish 2 ounces, of the Leaves of Betony, Burnet, Tops of Marsh-mallow, Nettles, Pennyroyal, Rocket, Calamint, Knotgrass, Pellitory of the Wall, each half an handful, Winter-Cherries No. xx. *Sebesten* No. xv. Bark of Baytree-root 3 drachms, Seeds of Basil, Burdock, Parsly, *Seseli*, Millet, each 3 ounces, Raisins, Liquorish, each 3 drams. Let them be boiled in *Balneo* from 10 pounds till 6 remain. Of which with Sugar 4 pounds, clarified Honey 2 pounds, make a Syrup, spice it with Cinnamon 1 ounce, and Nutmeg half an ounce. The dose 3 ounces, with 6 ounces of the Decoction of *Eringo* for 15 days, 5 hours before dinner; but universals premised.

Horat. Augu-
stinus, Epist.
med. l. 12.
Ep. 1 & 2.

4. I found ease by no diuretick, except Bean-shell-water, which brought away Gravel; so that more may be attributed to this Medicine in bringing away the Stone than to *Millepedes*.

Tho. Bar-
tholinus.

5. Eggshells, when the Chickens are hatched, are given with singular success, either to break or expell the Stone. Several reckon this Lithontriptick among their Secrets.

Idem;

6. It does a great deal of good in loosening the Urinary passages, if Chervil chopt very small and fried in a pan with Oil of Scorpions, be applied to the part grieved. ¶ When the ways are loosened nothing is more effectual to remove the Stone, than if 1 drachm of pure Nitre, i. e. *Sal Prunella*, be given in Rhenish-wine warm, by which Medicine alone I have often brought away the Stone of the Bladder from Children. ¶ Crabs-eyes are of tenuous parts and diuretick, they break the Stone, and force it away by Urine, especially the Liquor of them, which prepared after this manner is the best; To Crabs-eyes finely powdered and put in a Glass, pour some

Beverovicus
de calculo, c.
12.

Id. Ibid.

Acetum

Acetum Terebinthinatum, stop it, and digest it for a night in hot Ashes. The next day pour off what is dissolved, and pour on more, repeating it so often, till you see all the Crabs-eyes dissolved. What Vinegar you have got, filtrate and evaporate it, the Salt will remain in the bottom. Bruise it, and dissolve it in a Cellar into Liqueur. Eight or ten drops given with Horse-Rhadiſh-water are far more efficacious

than they are in substance. ¶ *Quercetanus* his Nephritick Water is very good; Take of the juice of Horse-Rhadiſh, Lemons, each 1 pound and an half, Water of Betony, Saxifrage, Silver Weed, Vervain, each 1 pound, *Hydromel*, Malmſey-Wine, each 2 pounds. Let them stand four or five days upon a gentle fire in *Balneo*. In these Liqueurs mixt together steep of Juniper Berries bruised 3 ounces, of the Seeds of Millet, greater Burdock, Saxifrage, Nettles, Onions, Anise, Fenil, each 1 ounce and an half; of the four greater cold Seeds, Marshmallow each 6 drachms, *Spec. Lithotrip. Elect. Ducis & Justini*, each half a drachm, burnt Eggshells, Cinnamon, each 3 drachms, Cloves 2 drachms, then strain them well out, distill them in Ashes. If you take 2 drachms of this Water, it doth wonders in suppression of Urine, breaking and expulsion of the Stone, to which if you add its own Salt in a convenient quantity, it will become a far more excellent Medicine.

Idem p. 179.

Balthasar
Brannerus
de calculo.

J. Caf. Claudius.

Crato, l. 6.
Conf. 79,
l. 80.

7. The following Syrup is an excellent Remedy, leaving no calculous matter behind in the Kidneys, if after Purging 2 spoonfulls of it be taken twice or thrice every week in the morning. Take of the juice of Speedwell half a pound, of ground Ivy 3 ounces, of Purslain 1 ounce and an half, let the expressed juices, when they are strained, be made into a Syrup.

8. This is a familiar Medicine with me; The extract of *Millepedes* made with hot Water. The dose 2 ounces.

9. Draw the juice out of Purslain, dry it and make it into Pills, give 1 drachm of it, it expels the Stone to a wonder. ¶ The distilled Water of a Man's Urine, or a Bull's, if the Patient doth not loath it, conduces wonderfully to the breaking of the Stone, and provoking of Urine. ¶ Let the Patient eat 9 or 10 Hazle-Nuts well picked before dinner and supper; for I have found by certain experience, that not a few, who have been afflicted with the cruel tortures of the Stone, for a long time, by eating of Hazle-Nuts have been cured. ¶ Strawberry-water with the Kernels of Hazle-Nuts bruised, taken in a morning, so as you can sleep upon it, is good for prevention. ¶ In a most grievous pain and heat of the Kidneys, I have found this plaster help to bring away the Stone with a great deal more ease; Take 9 Crabs, boil them in a sufficient quantity of Water or Milk, bruise them, and boil them, and squeeze out the Juice. Steep the Crum of a White Loaf in this Juice, add the Yelks of 2 Eggs, fresh Butter and Oil of Violets what is sufficient, mix them; spread it on a linen cloth, and apply it to the Reins and Ureters. ¶ For the Stone, Take of the best Malmſey-Wine 3 pounds, Peach-Stones No 100, Bitter Cherry-Stones No 200, fresh Elder-flowers 8 ounces: Bruise them, and let both them and the flowers be infused in the Malmſey-Wine, but let there be two several Infusions, one for the Stones and another for the Flowers; let them stand a day in Infusion, and then distill them. Drink four or five ounces of this Water, it quickly breaks the Stone, so that it is voided by Urine. ¶ I prefer *Eringo* Roots candied, or steeped in White-wine, and Syrup of the Juice of Speedwell before all, though I am not ignorant that the Roots of Brier and Rest-harrow doe much good, when the Stone is manifest. ¶ In the Stone of the Kidneys the following Cataplasim, I find, doth wonderfully assuage pain, and force out the Stone with great benefit and success.

Let Pellitory of the Wall be boiled with Parsly-Roots, let the Roots when they are squeezed out be cast away, and add 8 or 9 Onions roasted in Ashes, pour on some Oil of bitter Almonds, and in very grievous pains Oil of Scorpions. ¶ For the Pain of the Kidneys, caused by the Stone, there is nothing better than a Decoction of Speedwell, and the inspissated Juice does as well.

Crato in consiliis.

10. There is a fungus growing to Stones, called *Lyncarius*, which dried, powdered, and given in Diuretick-Wine, doth so purge the Reins, that a Stone will never grow again there, which is confirmed by manifold experience.

Claudius De calculo.

11. The Sap of the Birch-Tree hath a wonderful property by nature, while it admirably moistens our Balsamick Spirit, that is the coagulation of the Stone, and by its radical moisture doth hinder, that by its dryness and heat it does not coagulate the useles and volatile *Sordes* of our Liqueurs.

Pet. Joh. Faber.

12. One kept the following Clyster for a great Secret. Take a pound and an half of decoction of Miller, and give it.

Jacob. Fontanus.

13. In the Stone this is a more powerfull Remedy; if a Hare be cut in pieces, put in a new pot, well luted and baked in an Oven, and then powdered. *Atius* and *Sextus Platonius* do prove this to be a very proper Remedy; for if this powder be put in Water or Wine, and the Stone be put in also, you will see the Stone dissolved in a short time. And we have experienced it not onely good to break the Stone, but to prevent it, to which powder we add some Turpentine, Liqueurish Juice, or Oxymel of Squills.

Christ. Gualt. rinus, Conf. Med. 125.

14. Fresh Oil of Hazle-Nuts, drawn by a Press, is commended, by the daily use whereof, a certain Physician attests he hath seen several Stones voided. The dose is 3 ounces.

Casp. Cal. de Heredia.

15. Motherwort is an excellent thing in all diseases of the Kidneys: for according to *Montagnani*, it is a secret Medicine, that hath a power beyond all others to purge away Urine and the Stone.

Fredet. Hoffmannus, m. l. 1. c. 12.

16. The blood of a young Fawn dried and given in a drachm weight, wonderfully expels the Stone, according to our own experience.

Wolf. Hoffmannus.

17. The Root of the herb Vervain bruised, and drunk in good Mede a little warm, doth not onely help those incredibly that are troubled with the Stone, but quickly reduces whatever it is that hinders the Urine.

Joh. Mercurius.

18. Juice of Lemons hath helped many in the Stone, which when carefully cleared, and taken in Malmſey-Wine, I have experienced not hurtfull to the Stomach, but most effectual to purge the Reins. However, if the Stomach should receive any harm, let the Juice be distilled by an Alembick, and then it is a most safe thing.

Christ. Gualt. rinus, Conf. 126.

19. The flower and seed of Star-thistle are highly in request among the People, whose force and efficacy in purging the Reins and Bladder, we daily find more and more, if 2 ounces of its distilled Water be taken in the morning.

Ind. Mercatorius de Calculo, p. 756.

20. Let the Patient take Sugar of Roses an hour before meal the whole year through; for it is an excellent Remedy for the Kidneys.

Joh. Bapt. Manius, c. f. 194.

21. A certain Noble Matron found the admirable virtue of Golden-Rod, first made known by me, in innumerable Nephritick persons with happy success.

Carolus Fris.

22. Take Wheat and boil it till it swell or burst, put it hot into a bag and apply it: You may trust this as a secret.

Hercul. Saxonia.

23. Goats Blood mixt in a Mortar with Barly, and applied as a Cataplasim to the Part grieved, doeth much good in ease of the Stone, or any Tophus in the Reins or Bladder. ¶ If the Stone in the Kidneys be hard, and not to be broken, and by reason of obstruction Urine be stoppt, the herb *Eacony* drunk with Wine and Honey is very good.

Alex. Trallianus, l. 3. c. 34.

Idem. c. 33.

24. Sennertus commends *Lignum Nephrcticum* and *Lapis Nephrcticus*, taken either inwardly, or onely worn about one.

Medicines.

I. **W**HETHER can the Stone in the Bladder be broken with Medicines? Many utterly deny it, many affirm it but coldly: I with *Galen*, *Hippocrates*, *Dioscorides*, *Rhafs*, *Avicenna*, and infinite Classick Authours (who prescribe many Simples and Compounds, acting by their tenuity, acidity, asperity, and by their Diuretick virtue) do hold, that there are things in Nature which break the Stone. What hinders it I do not see, since there is a dissolving Salt, as well as a coagulating one, and that the virtues of things must not be denied in Plants, Herbs and Stones: We see also how soft Water, by continuance, doth hollow the Stone, that Iron is eroded by virtue of Simples, and that there are Simples which soften Stones, and why not break them. We read in *Ætius*, l. 2. how *Philagrius* cured the Stone in the Bladder with Goats-bloud, and a Hedge-Sparrow mixt together: How a Jesuite at Rome cured a Printer's Son with *Millepedes* rightly prepared: How *Rhafs*, lib. 9. cured an old Stone in the Bladder with his Pills, with which *Horatius Augenus* and his Father, and other Physicians, cured several of the Stone. If the fore-cited Authours commended their Medicines, and they had no such Virtue, What did they in so weighty an affair, but put a cheat on Mankind, which to say of *Hippocrates* is Blasphemy, who, according to *Macrobius*, never deceived others, nor himself? *Bartholomæus Turrianus* in *Iatroch.* lib. 4. f. 269. broke a Stone that was then designed to be cut, by giving a little powder of Crystal to drink, or rather the dissoluble substance thereof; which same Liquour *Th. Maffetus* mentions,

de jur. & præstant. Chymicorum. Now Crystal is made soluble, if it be calcined in a Potter's Furnace at least nine times, then it becomes of a brittle substance, and put in a Cellar, it melts like Oil of Tartar: Or let the Crystal Stone be heated in the fire, and quenched seven times in the water, or Spirit of the Lesser Nettle. According to *Johannes Prævotius*, the Stone in the Bladder is broken by a Plaster of White Onions, boiled, and applied to the bottom of the Belly. If therefore Histories be extant of persons troubled with the Stone, that have been cured by Medicines, the chief Remedies must be tried, before the Patient commit himself to the greatest hazard. *Gul. Laurembergius* his History of a person cured of a great Stone by the use of Sows; and *Horatius Augenus* his History of another Patient are well known. But such examples establish no rule: they onely convince men of the possibility, which we do not deny: Several circumstances also cannot be known, as whether these were onely gravelly coagulations, and not flinty. In this therefore, or the like case, I can approve of no sort of true Diureticks, if the Stone be great, hard, and like a flint; for neither thus can we hinder its increase. The distance of the place is far, and the ways by which the Medicines pass, many; if they be weak, they lose their virtue before they come at the Urinary passages; if strong, they carry matter from the whole Body to the Bladder; nay, these doe more hurt, for by their acrimony and tenuity they take away, and wash off that Lentor and phlegmy matter, that like Mucus usually sticks to the Stone, and serves it for a bed: this gone, the Stone is made sharper, raises more intense pains, and hurts the Bladder more. A Patient of mine experienced this, who having used Diureticks for two years, found no benefit, whether he took Chymical or Galenical things, nay, he rather daily found more pain. *Crato*, Physician to three Emperours experienced the same, who seriously dissuades men in the pain of the Kidneys from those Diureticks, that force the Stone. His Eminence Cardinal *Cornarius*, when he had a fit of the Stone, and was afflicted with difficulty of Urine, being unwilling to observe the Dissuasion of his Physicians, went (contrary to *Mercurialis* his advice) to the Bathes that work by Urine, when he took the Waters his pain increased, and he died. *Guarinius* saith, *Conf.* 300. That scarce ever any one saw the Stone broken by Medicines. Yet I broke the Stone in the Bladder of a Boy twelve years old, and brought it away piece-meal by this one Medicine; Take of purple Violet Seeds half an ounce, of Water of Strawberry, Rest-harrow, Alkekeengi, each what is sufficient; make an emulsion according to *Art. rios.* an. 76. Add of prepared Sows 1 drachm, Goats Bloud 2 pounds, Species Lithontriptic. 1 Scruple, Spirit of Turpentine half a scruple, mix them, let 2 Spoonfulls be given frequently. He voided pretty large pieces, and inclining to blackness, so that one shell seemed to have grown over another.

II. *Mercatus* makes four Classes of Medicines that break the Stone, and he reckons those in the third, that he thinks do improperly break the Stone, and he saith, they doe good onely by absterging and rubbing the surface of the Stone. And he teacheth that all are such, which by their asperity absterge, and as it were rub, for when two rough bodies rub one against the other, they wear: Hither belong the *Lapis Spongæ*, *Lyncis*, powder of burnt Eggshells, &c. Some do reject the use of such things, because it is scarce likely, they should break the Stone in the Bladder, and not hurt the intermediate parts: But we must observe, that such things are not given whole, but reduced into subtil powder, yea dissolved and reduced into Magisteries, where their efficacy does as much depend upon their Saline Spirit which gets into the Stone, and dissolves it into Atomes; just as Metals and Minerals are dissolved in *Aqua fortis*, and Coral, Pearl and the like in Vinegar.

Sennertus. gar. For which reason the use of such Medicines should not be neglected.

III. All things premised that should be premised, we must of necessity come to some effectual Diuretick, that may be able not onely to cleanse and wash the Reins, but to run to the Bladder also, that it may make the Stone to move and swim as it were in the hollow thereof, that so it may more easily come to the neck, and either be forced out, or taken out with an Instrument by a skilfull Chirurgion. Neither let *Avicenna*, nor the advice of almost all Physicians, deter you from this work, because forsooth the use of Diureticks must wholly be avoided in the Stone of the Bladder, by reason they deprive it of its mucilaginous coat, and therefore may cause more cruel and bitter Pains. Indeed the Objection might have place, if the Debate were about prevention, which requires diversion from the Bladder: but while we are treating of the Cure, that is, of discharging a Stone, that is as yet but small, Diureticks, yea the stronger sort, are requisite, before it be so large that it can get no more into the Neck of the Bladder, much less pass the *Urethra*.

Fortis, consuit. 13. cent. 4.

IV. Some are of opinion, and that not without reason, that the Stone may be broken with liquours injected by a *Catheter* into the Bladder. For seeing these liquours are nothing altered, nor lose any thing of their virtue in their passage, as Medicines which are taken at the mouth do; but that they reach the Stone in the Bladder, they may exert their whole virtue upon it. You may try the virtue of such liquours without the Body of Man, upon some Stone that hath been cut out or voided from the Bladder. *Gardan* requires these Conditions in such Waters, that they break the Stone, and doe no harm to the Bladder: And he commends a Water made of the Ashes of Scorpions, Parsly, Roots, of Butchers-broom, Crabs-eyes, Pigeons-dung, Pellitory of the Wall; and he had rather have it made of many things mixt together, than of one Simple. ¶ *Rolsincius*, *conf.* 3. l. 9. intimates that they are Cheats, who boast of any thing they have done by Injection with a Siphon. ¶ *Zecchini* judges such Injections are to no purpose.

Sennertus.

V. I knew a person that was for a whole year and a half treated by his Physicians as one that had the Stone, because he had the Pathognomick signs, a Weight or Load about the *Pubes*, Strangury, Disury, Falling out of the Arse-gut, Itching of the *Glans*, &c. He takes a Journey into *France*, intending to commit himself to a Lithotomist. When he had been at *Paris* two months, and drunk strong Wine, in the third month, and for forty weeks, he voided by Urine a great deal of clayish matter: And from that time he was very well, nor felt he the least of it any more; only he ever after used a Diuretick drink, i. e. small Wines.

Ph. Salmuth. cent. 1. observ. 25.

Riolanus, Antropogr. lib. 2. c. 24.

VI. A bad conformation of the Bladder is very rare, yet it may be; and you must carefully observe in searching for the Stone, if, when all the Pathognomick signs are there, you cannot find it with your *Catheter*. For in some a double Bladder hath been found, in others it hath been divided by a Membranous Partition.

Schellingr. ad l. 1. c. 50. Holler.

VII. We are often deceived by the Likeness of the Stone, as in a Nobleman, who, after he had been tormented with his Urine eight months, the Physicians and Chirurgions doubting whether there was not a Stone, having used Medicines to no purpose, was cut for the Stone, as Lithotomists use to doe. He was eased of his pain; yet they found no Stone, but Flesh in the Neck of his Bladder, which by degrees was consumed with convenient Medicines.

VIII. Within the *Urethra*, upon the Caruncle, that closes the Extremities of the *Vasa ejaculatoria*, you will find a thin Membrane circumtended like a Valve, at the orifice of the Neck of the Bladder, which hinders the reflux of the seminal humour into the Bladder, and that no drops of Seed hang about

those places. You must have a care, when you put in your Probe, that this Membrane be not torn; for it is easily broke by putting a *Catheter* into the Bladder, or a Wax-candle for the cure of a Caruncle.

Riolanus, Antropogr. lib. 2. cap. 27.

IX. When a Stone grows to the Bladder it is very hurtfull, for whether you take it away or leave it, you either way kill the Patient. I saw an example of such a dangerous Accretion in a dead body, whose bladder contained a Stone wrapped in a Membrane, and so close knit with Fibres to the coat of the bladder, that I could scarce pull it thence without tearing of it. ¶ As a Lithotomist was taking the Stone from a poor Wretch, he pulled out bladder and all; for it was so grown to the Stone by so many and so strong bands, that no skill was able to separate it. Let Lithotomists here consider how easily the Wax-candle may deceive them, and how little they ought to trust to the putting in of an Iron Probe: for a resisting Hardness is an infallible token to them that there is a Stone: But the Stone wrapt in its coat, neither resists the touch nor struck upon gives any sound, wherefore they must not trust to these experiments alone, but should call other Signs to their assistance. But what shall the Lithotomist doe, when he hath found such a Stone, cut the *Urethra*, and laid the neck of the bladder open, as it should be? Shall he take it out or leave it there? He must take it if it will come, he must leave it, if there be reluctancy. Nor indeed do all, that are inclosed in a coat, grow to the bladder, but some of them fluctuate freely hither and thither, and come out as easily as if they had not been covered with any Membrane at all which I saw in two Women. But if the bladder be ill conformed, whether for a membranous partition that divides it, which *C. Bauhinus* observed; or an *Ectophysis* sticking to it, as in the famous *Casaubon*; or for its complicated Membranes growing closer to the *os pubis* than that Section can be made without evident hurt to the bladder, such a position of this part as I once indeed observed in one that was designed to be cut, then there is no less need of circumpection, as one may see in the example here instanced, upon whom the Lithotomist had certainly done his office little to his own credit, had he not, being frightened with this perverse situation of the bladder, in prudence desisted: for this Stone was implicated in so perplexed an error within the contorted bladder, that (as Anatomy informed me) *Æsculapius* himself could not have got it out without manifest danger of life. ¶ One man's bladder contained two encompassed so close by its corrugated coats, that it was scarce capable of an ounce of liquor besides them.

Nic. Tulpæ lib. 3. observ. 5. & 6.

X. Although Stones that stick and are fixt, can hardly be pulled away, and the greater number of these that are troubled with such do dye; yet the Cure is not impossible, seeing it is observed daily that several such have recovered: amongst which I saw one, from whom a two ounce Stone was taken, inclosed in a bag, which rarely happens.

Adgenius, Epist. 2. l. 4.

XI. Many Errors are wont to be committed by vulgar Lithotomists in taking out the Stone; the First is, When they allow the Patient the days next preceding, and in the whole course of his Cure to live as he list, neither premitting Diet nor Preparation, whence many Inconveniences and Death do follow, for all things run from a plethorick and cacoymick Body to the place affected: Therefore let Diet, Preparation and Purging go before, &c. 2. They think they have done the business, when before cutting they have purged their Patient with Antimony, *Mercurius vitæ*, &c. But these violent things debilitate the Strength and native Heat; whence the Patient often dies after the operation. 3. Some for a few days before the operation give a full draught of a decoction of Rest-harrow-roots or Millet-seed morning and evening, to bring the Stone to the neck of the bladder; but many mischiefs flow from

Fabricius
Hild. c. 23.
de Lithot.

from thence, for much humours are carried from the whole to the urinary passages, whence follow after cutting dangerous Symptoms, Inflammation, Gangreen, Convulsion and Death. Wherefore onely gentle purgative Potions must be given, because if Lenitives do purge also by Urine, how much more will strong Purgers, which have also a diuretick virtue, do it?

XII. Lithotomists, when they have got out the Stone, often commit many Errors, which want rectifying. Some think the Wound should be drawn together with one Suture or two, that it may the sooner heal: but they do ill, 1. Because a Tent cannot be put in as it should, nor the blood gathered in the bladder (whence come many Symptoms) be got out: 2. It is known that after the Stone is got out, there often remains Gravel, Phlegm, clotted Blood and Matter, which not taken out doe much hurt. 3. Suppose there be no such things; yet it is certain that the bladder afflicted so long, does crave time to purge out the gross and viscid Phlegm, that it daily breeds; but this must needs be done by the open Wound; for seeing the urinary passage is long and turning, therefore it cannot be voided that way, especially when the expulsive faculty is weak. II. Many Lithotomists immediately after the operation clap the Patient in a Semitecupe (in which they boil indeed appropriate herbs) and keep him there half an hour for the easing of his pain, and heating his body which was cooled by cutting: But so there is imminent danger of an hæmorrhage (the Vessels being opened) which is attended with fainting and weakness, and is one cause of Death after operation. Thus they offend against Aphorism 5. 23. Then after bathing much Vapours ascend, another cause of fainting: It is the property of the Bath also to draw, whence a great quantity of humours is drawn down in a manner violently from the parts above, from the Loins especially, which were stirred by the operation, and other Symptoms follow, all the ways and passages being loosened by using the Bath; so that all the excrementitious humours flow to that Wound, and hinder the healing of it. III. Some Lithotomists reject the use of Tents, and doe all their endeavour to heal it quickly: The Physician indeed should cure quickly, but safely also; now there is no safety, unless the Wound be kept open by the help of Tents, for some days after cutting; and the bladder be cleared of gravel and phlegm, which would grow together again by reason of the heat and inflammation left in the bladder; whereupon the latter Evil is worse than the first; for a Gangreen doth easily follow. IV. The Error of a renowned Chirurgion must be remarked, who writes, that 'tis sufficient when the Stone is taken out, if the Wound be closed with clean Lint, for the Urine is enough to heal the Wound by its detersion and consolidation, wherein it excels, if so be (he adds) that no symptoms supervene. And he says well, for how will you obviate the Symptoms, Pain, Swelling, Inflammations, &c. which usually follow Wounds joined with contusion? But if you would prevent them and Death that would otherwise certainly follow, keep the Wound open with Tents, which would otherwise so close with the swelling, that neither Urine nor the viscid humours, blood nor matter that remained after cutting, can run out: Besides, Urine cannot serve the turn of a Medicine, when it has got an acrimony and corrosive faculty from pain and a preternatural febrile heat. They that have tried it know that Urine retained is the chief cause of the Symptoms which usually follow cutting for the Stone: therefore a prudent Chirurgion will provide it an easie passage, by the help of Pipes and Tents. V. Nor is their error less, who make it their business by frequent traumatick Potions to cleanse the Bladder of Impurities, Phlegm, Gravel, &c. expecting hence a perfect Cure of the Wound: But who can believe that these can pass to the Bladder, or bring any be-

nefit, when Diureticks (though endued with subtile parts) cannot, according to *Galen, Art. Med. c. 96.* penetrate thither? VI. There are some who presently after the operation give a little Powder in a Glas of Wine as a singular help, and not in the beginning onely, but in the whole course of the Cure, hoping from thence for an abatement of Pain, a Repulse of the afflux of humours, stopping of blood and suppuration: But Wine, that is hot and sharp by nature will not stop a flux of blood, for which work cold and dry Medicines are requisite: and it will not assuage Pain, nor promote Suppuration, as being hot, it rather being fit by its acrimony to enrage than appease a Wound, which office is onely granted to hot and moist things, and those void of all acrimony.

XIII. Authours propose three places, by which the Stone may be taken out; 1. The orifice of the Bladder (as is usual in Women) by which *Alpinus* testifies, *lib. 3. cap. 4.* that in *Egypt* he hath seen a Stone taken from Men, the *Urethra* being dilated by blowing. 2. That part of the *Hypogastrium* that we call *Pubes* in a larger acceptation; which place *Roussetus, lib. de Partu casu. c. 7.* proves to be commodious and to be preferred before the rest, after he had heard how it once happily succeeded with *Pet. Frantoni*, who notwithstanding does not himself approve of this way. 3. The ordinary place, and that which is received hitherto by all Men, in Men and Boys is the *Perineum*. But *Mr. Collet*, a Lithotomist of *Paris*, descended from a Family of Lithotomists, uses the great Apparatus, whatever age the Patient be of, because he thinks, by thrusting the fingers into the *Anus*, and also by the violent squeezing down of the belly (which according to the old method they used in Children) that not onely great pain was caused, but besides that, an Inflammation and Gangreen of the said parts. They testify as much, who have at any time had the experience of a search for the Stone by the fingers thrust into the *Anus*; for they plainly declare, that neither the cutting, nor taking out the Stone put them to so much pain as the Search did. How much more must this hold true in Children, in whom these parts are exceeding tender and frail?

XIV. Cutting for the Stone may by no means be performed while the Moon is in *Scorpio* (according to *Ptolemy's* rule in *Centilog. c. 20.* Do not cut any part with an Instrument, while the Moon is in the Sign, under whose dominion that part is,) as among others it happened to a Religious Person, who being cut at this time died. For seeing at that time the Moon doth fill the *Pudenda* and Parts adjoining with her great Humidity, which being placed below are forced to receive the flood from above; certainly if they be cut, they will easily be obnoxious to putrefaction, and death must attend them.

XV. In the beginning of August, Anno 1675. *Franc. Sabourin*, a *Poitevin*, a skilfull Chirurgion in *Geneva*, committed himself to Lithotomy. Some months before, he had gone to *St. Claude*, to which Town the way is very rugged through Rocks and uneven ways, whereby his Reins grew hot, and the first occasion of his illness sprung; for upon this he voided Gravel and had tokens of a Stone being bred in his Bladder. Upon his own proper motion he drank the Waters called *Vicomitenses* for three weeks, whereupon the heat of his Kidneys abated, but the Stone in his Bladder began to torment him more, to wit, the mucus being wiped off which inwrapped it, and rendred it less troublesome. Out of mere impatience he called from *Lions* a most experienced Lithotomist, *Labutte* by name, and joined with him *Messeneau*, a most skilfull Chirurgion. The Lithotomist falls to his work; but first foretold the danger because of the season, although no Heat had troubled us that whole year, and the Sun seemed every where as if he had forgot his Office; witness the Harvest protracted to the latter end of August, and the Vintage to November. The Operation suc-

Hildand.

Microtech.
p. 131.

D. Panarolus,
Pom. 3.
obs. 11.

on succeeded well enough, for presently a ragged Stone as big as a Pigeon's egg in shape of an Almond appeared, and was taken out without violence: Death notwithstanding followed on the seventh day (a Gangrene arising in the *Perinæum* and *Scrotum*) and it was ascribed to that unlucky Star. Which indeed I do not deny; but I think the greatest part of his Fate must be ascribed to the ease coming out of the Stone, by reason less blood came from the Wound, than the condition of the Patient, who was a plethorick Man, required. For presently, as the Operation was over, an astringent Cataplasin, according to custome applied, did repell the blood inwards which was found in the Bladder clotted and black, in great quantity, whence a Mortification was brought upon the neighbouring parts.

XVI. In these times the most usual way of taking out the Stone among vulgar Lithotomists is by that they call *Apparatus parvus*. When the Patient is bound as he should be, the Chirurgion puts the middle finger of the left hand into his *anus*, and with his right hand presses his lower Belly down towards his Bladder. Yet his Belly is not to be squeezed with a bare hand, but he must hold a soft Cloth several times doubled in his hand, or some Tow: because when the Belly is this way pressed by the hand, the Muscles oftentimes happen to be hurt and bruised, upon which Pain, Swelling, Inflammation, &c. do follow. When therefore he hath found the Stone with his finger put into the *anus*, he thrusts it to the Neck of the Bladder, then he makes his Incision upon the Stone, and with his fingers put into the *anus* he endeavours to force it out: which indeed in some, especially when the Stone is small, succeeds well; if not, they get the rest out with hooks. How dangerous this Operation is, any wise man may gather, when he considers, that in performing it, the Chirurgion may easily cut through the parts adjoining to the Neck of the Bladder, or the Neck it self; yea, and sometimes, the very Muscle of the Bladder; whence proceeds, 1. A great Hæmorrhage, by reason of a multitude of Veins meeting in the place, and raising a dangerous flux of blood. Then it is to be feared, the Patient cannot hold his Urine, or that a *fistula* remain in the part affected. It is observed also that in this operation the Bladder it self, because when evacuated, it falls within it self, yea, and the *Intestinum rectum* likewise have been both wounded, and so cut, that the Lithotomist (as *Peter Franc* observes) hath hurt his own finger with his Knife, and then the Urine came through the *Intestinum rectum*, and on the contrary the Ordure through the Wound. Therefore though this way was used by some of the Ancients; yet I would persuade the Operatour to find a more careful way. ¶ However I saw it twice successfully performed upon the self same Boy, by Mr. *Covillard* of *Monte-limar*, a most expert Lithotomist. He, anno 1655. took out a Stone as big as a Pigeon's egg, in a very short space of time, so that the whole Operation was over before you could say a *Pater noster*. The next year the same Boy relapsed into the same illness, by reason of a Petrified *minera* remaining in his Kidneys. This experienced Chirurgion, putting his finger into his *anus*, told them there lay nine Stones in the Bladder; he gathered them on a heap to the place designed for Section, which lying under the Knife, when the Incision was made, came out in the aforesaid number, some as big as Beans, others as Pease. But the Boy, through the calculous disposition in his Reins and Bladder, died consumptive the year following.

XVII. The Operation in a Patient, of a good habit of Body otherwise, and in perfect strength, if he fall into skilfull hands, is ever very safe, on this condition, that the Incision be rather too large than too little, when one is not certain of the bigness of the Stone: for if it be too little, the parts are

torn in getting out the Stone, and so an Ulcer arising, a Fever sometimes hastens the man's End.

XVIII. I would have Physicians know, that the outer extremity of the Neck of the Bladder does not appear in the same place in all Women: For it is seen inmost under the *Nympha*, above the outer straits of the neck of the Womb, few have it lye inwards in the upper part of the *pudendum*. Therefore there is a necessity to dilate it, whenever you would put ought into it. And it is worth the while to consider, that this passage, and the whole neck to the bladder may very well be so stretched by a dilating Instrument, as to admit ones Thumb without difficulty; if perchance a Stone should pitch there, or that so great dilatation should be requisite on any other necessary occasion.

XIX. It is certain that the Stone grows in Women as well as Men. A certain Nun could not make water for 12 days, the passage of her Urine being stoppt by a Stone, where also there was a confluence of much water. Wherefore when this mischief could neither be conquered by the Brass-pipe nor Medicines, I bethought my self of a course, unusual indeed, but very opportune. I cast a hook upon the Stone, lest it should slip back into the Bladder; then with a piece of Iron blunt at the end, I struck upon the Stone, till at several blows it broke into pieces, and then with what care I could, not to hurt any thing inwardly, I drew out both the hook and the Iron, upon which both the Urine and the Stones being voided, she presently recovered.

XX. When a small stone, forced out of the Bladder into the *Urethra*, stops the passage of the Urine, it may be taken out three ways, by a Knife, a Hook, and Suction. *Hildanus* advises to spare the Knife, as much as may be, because a hard Scar always remains in the cut place, hindring the dilatation of the urinary passage, whereby also there will be an interception of the Stone that is bred afterwards, which requires a new Incision there or very near it; which Wound is often followed by a *Fistula*. But if the Stone stick near the *Glans*, you may cut without fear, because in the fleshy end of the Member a less and softer Scar doth succeed, than in the middle duct of the Membranes. Whether notwithstanding we must proceed, unless Diureticks, mollient Potions, and sitting in a loosening Bath, have been ineffectual. From the Hook there is danger of scratching the smooth coat of the *Urethra*, instead whereof you may use the *parva terebra* of *Paræus*, l. 17. c. 40. or *Hildanus* his *tenaculum*. Stones, in *Tulpius* his opinion, though never so ragged, may most safely be got out by Suction, although *Hildanus* disapprove of it, because thus the Bladder's passage is rather contracted than dilated, and store of humours and blood is drawn to the *Penis*, whereby the Evil is increased. There is a fourth way invented by the *Egyptians*, of which *Alpinus* treats, de *Med. Egypt.* lib. 3. cap. 14. It is the blowing up of a man's yard with ones breath, the part next the belly being tied strait, so the *Urethra* being dilated, there is a passage open for the Stone, if it be a little one; for a great one sticks. Sometimes it is got out onely by the help of a *Catheter*; a trial whereof (saith *Tulpius*) when a Lithotomist was about to make not long since, with it alone he brought a Stone out of the Bladder, as big as an Olive Stone, more than half way the *Urethra*: where when it stuck fast, he happily got it out by help of an Incision made underneath.

XXI. The Stone, if it be a little one, is more difficultly got out of Men than Women: Yet no violence must be offered, because the Bladder is a sensible part, as also are the Privities, which when much afflicted raise Convulsions and mortal Inflammations. As it happened to *Vetus*, who when he had a Stone pitched in the passage of his yard, he got it drawn out with great violence and trouble.

Wierus, de
seru. p. 95.

Ant. Ben-
ven.

Hildanus,
lib. de *Litho-*
tom. cap. 13.

Hereupon his lacerated Member conceived an Inflammation and Mortification, whereof he died. This operation may be tried, when the Stone is small and will pass with ease; if it will not come away so, you may proceed to cutting.

XXII. We meet with another way of getting out the Stone. The Chirurgion, with his fingers put into the anus drives the Stone to the fore part of the belly, then by a hole cut in the *Musculus rectus*, according to the duct of the Fibres, above the *Os pubis*, he takes out the Stone by the help of a Pair of Nippers. If the operation be performed this way, a dribbling of Urine need never be feared; and besides, a larger space is allowed to take out the Stone. But in the mean time this operation is in itself dangerous and troublesome; for if the Lips of the Wound made in the Bladder be not united to the Muscles of the Abdomen, an Exulceration of the Bladder follows, which does not onely create notable Pain, but is esteemed more incurable than the Stone it self. ¶ *Roussetus* out of one *Franc* commends Cutting for the Stone in the Groin, whence it is called the *Franconian Cutting*, in Children especially. Nor is *Hildanus* averse to it in larger Stones, which cannot be brought to the *Perineum*; for it is taken out there with less pain and danger of an Hæmorrhagy. The healing of the Bladder need not fright a Man, because it hath carnosus Fibres, by the benefit whereof its innate Heat is cherished and its Wounds cured. There are several examples of a wounded Bladder being happily cured. And since the very Stomach and Womb may be wounded and cured without damage, what danger there can lye in this Cutting of the Bladder I do not see, so that an expert hand undertake it.

XXIII. In very old Men, who labour of a most cruel Dylury from a great Stone, that cannot be taken out without manifest peril of Life, that we may alleviate the miseries of Life, we cut the *Perineum* after the same manner as is usual in taking out the Stone, and keep open the hole with a little Pipe. As long as Life is prolonged, the Pipe is stopped with a Cork, and a Sponge is applied to receive what drops, if there be any thing. When they have a great desire to piss, they pull out the Cork, then put it in again, and so the torment of Micturition in persons troubled with the Stone is mitigated.

XXIV. If Stones must be cut out of the *Urethra*, and can be got out no way else, they are to be held fast with the fingers both above and below, nor after the Wound is made must they be let go, till the Stones start out, or be taken out with a pair of Pliers: For if they be let go, the Wound of the *Urethra* is so hid by the Skin that covers it, that it cannot be found again, by reason of the convex superficies of the *Urethra*, and the lax Skin over it.

Medicines especially made use of by eminent Physicians.

Don. ab Al-
tomari. 10.

1. *Alexander* approved of Kid's or Goat's blood applied hot outwardly as an effectual Remedy invented and proved by long time and experience; but far more, if you smear it in a hot Bath often and at certain Intervals.

Horat. Au-
genius.

2. A most excellent Remedy to break the Stone; Take of *Millepedes* prepared 1 drachm, *Aqua vita* half an ounce, Broth of red Chich-pease 9 or 10 ounces. Drink it warm an hour before Dinner.

Job. Baveri-
us, cons. 4.

3. *Petroleum*, wherein *Lapis Lyncis* hath been boiled, strained and injected by a Syringe, wonderfully breaks the Stone in the Bladder, the yard being about that instant embrocated with a decoction of Mallows.

4. I made use of this Medicine in my self for the Stone in the Bladder. Take of prepared Sows, Sponge of Wild-rose-tree, Seeds of Purple-violets, each 1 ounce, *Spec. Lithontript.* 2. drachms. Make

an Antidote. Two drachms of this were taken in 10 ounces of diuretick decoction, and 2 drachms of Spirit of Juniper. I took this at five by the clock every morning for some time: and a little after great store of reddish Urine came away with Flakes in it like Fishes scales, which was the coat or crust loosened from a larger Stone; by the continual use of this I was freed from the Stone. ¶ This is a noble and royal Nephritick liquor communicated to me by an illustrious Prince, of which *Paracelsus* in his Book *de Tartaro* makes mention, though but obscurely. Take of White-tartar powdered, dissolve it into liquor in a Glass in a Cellar, which hardened again, at the fire must be calcined and powdered. Take of this Powder 1 ounce, pour to it Parsly-water 2 pounds, mix them, and let them stand till the Powder be dissolved, which done, let it be filtered twice or thrice through a Paper, that it may become a clear and pellucid liquor, which with Chips of Orange-pill cast into it, is tinged into a Citrine colour, and kept for use. The Dose is 1 spoonfull in 5 or 6 ounces of White-wine, with which I use to give some Strawberry-water.

Guilhelmus
Laurember-
gus, de calc.
p. 17.

5. This is a Secret in the Stone; Take of Whites of Eggs boiled in Water, mix them with Oil of Nard and Maltick, add of the Powder of *Lapis Judaicus*, half a drachm ground fine upon a Flint, with a Decoction of Millet and a little Cummin. Take a little of it strained morning and evening. Several have been cured by this when they could find no benefit by other Medicines.

Maroldus,
Pract. Med.
p. 249.

6. A certain Physician told me, he had cured several after this manner. He took a Hare with young, he cast away all the Inwards, then he filled the belly with the Dam's blood and burnt it to Powder in a new Pot, of which with as much Sugar he gave a little in a Spoon, in a short time the Patient voided the Stone in little pieces by his yard. ¶ A certain experienced Man took a Hare, and casting away the Inwards, he filled the Belly with the Skin, Saxifrage, Millet, *Lapis Lyncis*, *Lapis Judaicus*, *Lapis Spongia*, Cinque-foil and Goldenrod, and burnt it to Powder in a new Pot: The Dose was 1 spoonfull, with a little Wine, or the like, every day; it broke, and forced away the Stone in the Kidneys and Bladder.

Whether we may repell in a Canker in the Breast? XXIII.

A Phlegmone resembling a Canker. XXIV.
Medicines.

I. A Canker can difficultly be discerned from a Scirrhus, except thus, that is, If you lay some lenient and emollient Medicine upon the Tumour, and after two or three hours if you see it either diminished or quite gone, there is no suspicion of a Canker: But if the Swelling abate not, but grow into a Spongy substance, it is for certain a Canker.

Walrus,
Meth. med.
p. 21.

II. It is observed, that there is a double poison in a Canker, one Putrefactive, another Corrosive. If you apply hot and moist Medicines (which use to promote pus in Imposthumes and Ulcers, that are capable of ripening) then it will degenerate into deep Putrefaction, and will corrupt all near it with Rottenness: But if you would correct this foulness by Causticks, the other Poison that in Cankers is Corrosive will rise and burn all things near it.

Hernius,
com. ad aph.
38. Sect. 6.

¶ A Matron that had passed her 50th year, her Menfes leaving her, was taken with a Swelling in her right Pap, at the first hard and without pain: Some years after, when it increased and caused pain, she made use of a Surgeon, who, when he had applied Emollients and Suppuraters for almost a Month, as the pain increased by degrees, the Swelling broke, which presently turned into a malignant, painfull and foetid Ulcer, which at length proved mortal.

Hildanus,
cent. 3. obs.
89.

¶ An occult Canker often lies hid a long time without any harm, but when provoked, it eats the skin: And when that is open, either of it self, or by the unskilfulness of him that hath it in hand, ever after it will be kept within no bounds, but like a ravenous wild Beast devours whatever comes in its way. And by how much the more freely the vapour contained in it exhales, by so much the more violently doth the humour flow likewise, which will encrease the Swelling: into whose intimacy, if the circumstuous Air, which was excluded before by its coats, do indeed penetrate, presently there follows both a greater putrefaction, and a more luxuriant rankness in the part affected: which, if you do but endeavour to hinder, either by Instrument or sharp Medicines, you do but twist ropes of Sand. The Daughter of Geropius Becanus carried in her left Temple, for above Fifty years, a hard and uneven Carcinoma, but without an Ulcer, or any great harm: however, the pain and itching, by little and little encreasing, she imprudently applied to the Tumour, I know not what Caustick Medicines, which corroding the Skin, it quickly degenerated into an Ulcerated Carcinoma.

Nic. Tulpius
lib. 1. obs.
47.

III. There scarce occurs any one disease this day in Surgery, about which greater errors are committed than in the Canker; Do you ask the cause? The Disease and the Essence thereof is not sufficiently clear to them; and in the Cure they too strictly observe that Axiome of Physicians, *Contraries are Medicines for their Contraries*. For when they see the Tumour very hard, they endeavour by Emollients and Resolvers (contrary to Galen's opinion) to amend that hardness; afterwards, when the Tumour is degenerated into an Ulcer, they consume the Lips that are hard, with Escharoticks and Corroders, they correct the filth and stink of the Ulcer with *Egyptiacum*, and such things, all which, how unreasonable and pernicious they are, many examples do shew.

Hild. cent. 6.
obs. 81.

IV. Carcinoma's, or Cankers, if they be cured to the bottom, can be cured no other way than, if they be Ulcerous ones, by burning; if not Ulcerous by cutting. For that there are some which may be cured, is evident from Hipp. lib. 7. Epid. about the Man that had a Carcinoma in his Jaws burnt, and was cured by him: And others, that neither can be cured, nor ought to be meddled with, appears from Celsus, because they are but provoked, and do in-

crease till they kill. And the difference lies not in the kind of the Disease, but in the Quality of the humour; for in the very several sorts of Melancholy some are sharper or milder than others. If therefore you perceive by any symptoms that a Man's Melancholy is so fowre, as that it is much irritated upon a slender occasion, perchance you must not dare to touch it: But if by other symptoms you perceive the Melancholick humour, that is in a Man, doth incline to an earthy or sanguine nature, you must try to burn it with Causticks; and then if the thing succeed well, you must proceed presently to fire, especially if the evil be in a part, which the disease can easily and speedily eat away, such as the Jaws: For in such cases, although you be not sufficiently ascertained whether the humour be able to bear this Remedy, you must try even with danger to burn it; because if the cure should be neglected, the disease might eat away the part, though coming of no ungentle Humour. Therefore you must try even with danger to cure a Disease, that would certainly kill.

Vallesius, l. 7.
E. id. p. 893.

V. Purging should rather be used in the beginning, according to the redundance of the Humours in the Body, if perchance the encrease of the Canker may be hindered by it, than that we should accommodate it onely to carry off Melancholick Humours, as they commonly doe, who think Melancholy to be the cause of it: which indeed (for a costive body may be better treated) can upon this account especially doe no good, because it cannot take away the cause of the Canker, that is poisonous besides. It is granted, that other poisons, as that which causeth the Pox, may be discharged the body by strong Purges often repeated, which it is not safe to doe in very weak bodies, that are troubled with the Canker, nor if it should be done, would doe any good.

Platerus,
Tom. 2. p. 704.

VI. Galen. 4. aph. 47. acknowledges he cured a Cancrous Tumour, that came in the breast of a certain Woman, by violently and often Purging her of black Choler in the Spring and Autumn. And by the like method of cure I also freed a certain Noble Countess of a Carcinoma in her Breast.

H. Montanus.

VII. We have no reason to question the repetition of Blood-letting again and again, for there is a fault in the Blood, upon its being vitiated the Tumour depends. And though a Cacochymy should rather be discharged by proper Purgers; yet when there was hot, exult and melancholick Blood in the whole, it ever pleased Galen, 3. de loc. affect. 7. & ad Glau. 11. and Hippocrates also, to abate its plenty by breathing a Vein; which is the more convenient, if heat and redness be perceived in the part, a token of the Fire's being onely kindled, and not that all is in ashes.

Forstis, con-
sul. 86.
cent. 4.

VIII. Cordials, especially those that resist poison, will doe more good in subduing the strength of this poison, than such as are accommodated to other humours; And these are the chief of those things that are given inward in this case, and should rather be used than vulnerary Potions; which nevertheless some, that they may try all things in a desperate disease, do prescribe in an Ulcerous Canker: And they most esteem of one that is made of a Decoction of Winter-green, and Ground Ivy in Wine, for the Canker in the Breast, and for all others.

Platerus.

IX. If in the part affected the peccant matter be but in a small quantity, then there is no inconvenience in strengthening the Part; because, when the Part is strengthened, that little which is left is easily dissolved by Nature. This Rule is gathered from Galen, 14. Meth. cap. 9. where he saith, *That in the beginning of a Canker the excrementitious humour, if it be but little, may be repelled to the principal parts; because unless it be suddenly repelled, the Melancholick humour does presently distend the veins, which when distended, the Canker is rendred incurable.* But that

Sanctorius
lib. de Rem.
Invent. c. 13.

that it is so, appears from *Galen*, 6 apb. 38. where he saith, the Roots of the Canker are Veins that are distended by melancholick Bloud, which unless it be removed, the Canker cannot be cured.

X. Sometime the Pain is most outrageous, which will not allow one to take any rest or sleep; wherefore we are often forced to have recourse to Narcotics, which, in this case, by reason of the intense heat of the humours, doe less harm. For once I saw a Woman, that laboured of a Canker in her Breast, who every night for four months took four or five grains of *Laudanum* without any hurt, and to her great comfort.

Riverius, praef. l. 15. c. 10.

Mauritius Cordus, in lib. 1. de morb. mulier. Hipp.

XI. A Noble Woman had all the right-side of her face, for a long time, beset with an Ulcerous Canker: She, after she had made use of several means prescribed by the Physicians of Italy, France, Germany and Spain, was at length eased by this common Barber-Surgeon's remedy; she cut young Chickens into thin and broad pieces, which she applied to the part affected, changing them often every day. Some use the Flesh of young Pigeons.

XII. Septicks, unless they be tamed by frequent washing in the juice of Purselain, Lemons, Nightshade, or Housleek, may not be applied to any Ulcer; and then they must be mixt in a small quantity with some gentle Unguent, and used onely to a part that is far from a principal one: for I have observed them, especially Arsenick, and sublimate in a greater quantity, and not tamed, applied to Ulcers near the heart, as to a Cancer in the Breast, that they once carried off a Woman in 6 days: About three hours after the Powder was srewed on her Breast, she, just as if she had swallowed it, was taken with a Shivering, then with a Vomiting, and frequent Faintings, with a languid Pulse; which symptomes encreasing by degrees, her extreme parts growing cold, and her Face and whole Body swelling beyond measure, she was miserably murdered. ¶ Have a care you do not use *Fredo's* Medicines for the Canker, for they consist of Arsenick: but that Arsenick is a destructive Medicine in cancerous affections, is certain. ¶ Therefore *Penotus* must not be haikened to, who, *lib. de vera prepar. et usu med. Chym.* extolls his Medicine made of Arsenick to the Skies: But he, good Man, was seduced by others, and never made trial of it himself; as neither did *Philippus Mullerus* of his, which he describes in *Mysteriis et Miraculis Chymicis*. The original of the Cheat and Error is from hence; Because *Theodorick* and *Lanfranc*, whom *Guido* follows, distinguished a Canker, into a Canker an Imposthume, and a Canker an Ulcer. The Canker an Imposthume is the disease so called by *Hippocrates*, *Galen*, *Avicenna*, and others, rational Physicians and Surgeons: But the Canker an Ulcer (so *Guido* calls it) is, when by reason of Ulcers or Wounds, irritated by sharp Medicines, bad melancholick humours become adust and troubled, and are drawn from the whole and parts adjoining to that place, where they putrefy, grow hot, and acquire an acrimony and poisonous quality, whence there is an encrease of the evil disposition, and it becomes a Canker: So *Guido*. But such Ulcers, though malignant, and oftentimes stubborn, are not yet Cankers, nor ought to be confounded with a Canker, whose Contumacy far surpasses the Malice of all Ulcers. Moreover in the Canker an Ulcer, or rather in bad and malignant Ulcers, I have known the Powder or *Arcanum* of the Physician of *Norimberg*, as also my *Escharotick* Unguent, to agree well with several; but in a true Canker neither of them can be used.

Fabricius Hildanus, cent. 6. obs. 82.

XIII. A plate of Lead smeared with Quicksilver is no contemptible Medicine for Cankers, that are not Ulcerous: for *Galen* testifies, that Lead is a very usefull Remedy for malignant and inveterate Ulcers: And that such Leaden Plates smeared with Quicksilver, are a kind of *Alexipharmack*, whereby the evil disposition of Malignant Ulcers is subdued and spent, when they elude the virtues of o-

ther remedies, *Guido* is witness. When this sort of Remedy was prescribed, the Lady M. for a Canker as big as a Walnut in her left breast, it's true, it did not cure her; yet it hindered the encrease of her illness. But growing weary of it, when she had committed her self to a certain Physician, who boldly promised her a speedy cure, she proved by the loss of her life, how dangerous the cure is, which is undertaken after the manner of other Ulcers: for when her Physician had thrown this Remedy out of doors, and applied remollient, heating and drawing things, the Swelling increased to such a bigness, that her breast, through mere distension, burst in the middle, whereupon an haemorrhagy arising, that could not be stoppt, the poor Lady expired in the Armes of her Physician.

Parvus, lib. 6. c. 30.

XIV. An occult Canker had invaded a Matron's right breast, after two years time it rose to a manifest Tumour. The Physician that was consulted ordered a Plate of Lead to be applied, and every other day to smear it lightly with Quicksilver; according to the example of *Galen*, *Guido*, *Parvus*, &c. But through the carelessness of those that lookt after her, the Plates did more harm than good. In the mean time the Canker encreased, and came to Suppuration; therefore the use of the Plate was laid aside. The Swelling broke of it self, and her torments ceased a little; but by and by they returned more violent and pungitive, the Canker encreasing in all its dimensions. It deserves admiration, that the Mercury which was formerly imbibed from the Plate, should drop so visibly, and in a pretty quantity out of the *Carcinoma*, which shaded the adjacent parts with its shining, nay, and sweat at the shoulders through the whole skin. I ordered a Plate of Gold (which Mercury uses to follow) to be applied, and a tent of Gold for the Ulcer.

Bartholinus, cent. 1. hij. 7.

XV. The Canker is taken away both by Medicines and the Knife. The Knife is better than Medicines; for eroding and sharp things cause pain, and this a greater flux of Humours. Yet the latter way of cure is sometimes proper; for erosion must be made in the Interstices of the Fingers, and in the Groin, because the tendons and membranes in these parts would make cutting very painfull. Among the caustick Medicines there is the *Holofericum Fernelii*, and Vinegar some use, that is better, the Ly of Sope boild up to a consistency: Arsenick, which pleases some, displeases me: Lest an Inflammation should be raised in the Neighbourhood, apply a defensive round about. Thus indeed a Canker may be taken away by Medicines; but it is better to cut it out with a Knife: This cutting is either speedy or slow. I saw a Canker so quickly cut from the Breast, that in the time of the operation I was scarce able to speak three words: But when a Canker is come to a great bigness, then this speedy cutting is not proper, for much good flesh is taken away, and a great hole is made, out of which the spirits can more freely pass, and thereby the Patient is more weakened. In this case, to recruit strength, Cataplasms steeped in Wine are applied: In less Cankers we may make the Section all at once, except in those of the Lips. But it must be all taken away; therefore first let the Operatour take the part affected, and these adjacent, in his fingers, and try well, whether all that is amiss may be taken away. A Canker once cut out doth often come again. 1. When all was not cut out, through timorousness, either in the Operatour, or in the Patient. 2. Because the Arteries that emit this vitious bloud, by reason the less Arteries are cut away from the part affected, must contain more bloud than before, and therefore when they are open, will discharge that bloud upon some other part, whence comes a new Canker. 3. Because there is so much malignity latent in the Body, that a Canker will always grow afresh. A Canker

Canker is easily cut out of the flesh; difficultly (but it may be done) out of a Membrane and Tendon, so that these parts be such as may be taken all away. For this reason, a Canker that possesses the intercostal Muscles, cannot be cut, because of the *Pleura*, that is joined to all the ribs. A Canker in the bone is most difficultly of all cut: Therefore this disease requires a Caustery. The dissection of the Canker must not be made at a great distance, as is the custom in a Gangrene; yea, if it may be done, we must cut off no good flesh.

Walrus,
meth. med.
p. 128.

Amatus,
cent. 3. curat.
32.

XVI. I have known some Women, who had Cankers in their breasts, that by a good order of life, without any trouble of Topical Medicines, lived a long time, as well as if they had been troubled with no Disease.

XVII. Although no peculiar Operation be owing to a Lip which is troubled with a Canker, other than what is due to a Canker in any other part, namely, the extirpation of the Disease, with the part it is in; yet let me caution young Operatours, that the way described by *Aquapendent*, to wit, to doe it with a sharp piece of Money, or hard Wood dipt now and then in *Aquafortis*, is by no means to be approved of; because the *Carcinoma* will be enraged by such a Liqueur.

Van Horne,
Microt. p.
120.

XVIII. I will add the observation of the excellent *Scultetus*, that a pair of Scissers is very incommo- dious to cut away part of the Lip, troubled with a Canker. The reason is, because something of the Ill is always left; whence it comes to pass, that it breaks out again, which he saith he observed twice in the same Subject.

Bartholinus,
cent. 1. Hist.
7.

XIX. I cured an old Man of 84, of an exulcerate Canker in his nether Lip. I cut it out by the roots with a sharp Incision Knife; the blood ran violently out, which, when I had let it run on purpose about ten ounces, I staunch'd, without any Sealing, only with a little burnt Cotton and Astringent Powders. After the use of Digesters good Matter ran out (a token that the whole substance of the Canker was taken away.) Afterwards with a Camphorate Ointment of Cerus made in a Leaden Mortar, I brought a Cicatrice in twenty days time. But three years after a new Canker arose in his Jaws, of which he shortly died, contrary to my own, and all mens expectation, when it was not likely at these years, that an adust, Melancholick Humour should breed again, and cause a new Canker in another place. I was confirmed in this opinion, because I had seen a Woman of 70, that had an Ulcerous Canker in her Nose, to whom I prescribed the same Ointment, rather to ease her pain, than to cure her, who yet, beyond all hope, in a month's time, was perfectly cured. I also cured a Man of 40 of an Ulcerated Canker, as big as a Pigeon's Egg in his nether Lip, after the same manner, i. e. by cutting; with the addition of preparation, and purging of the Melancholick Humours, and yet there arose no Canker in any other part of the body. So therefore sometimes we need not cast away all hope of curing those diseases.

P. Marchet-
ti, obs. 29,
p. 30.

XX. A Canker in the Breast is sometime occult, sometime Ulcerous and manifest: besides, the disease is sometime in one part, sometime the whole Breast is affected, yea, sometime it creeps farther, and gets into the Glands under the Arm-pits. Keep your hands off such, for the cure is in vain, as also experience shews that to be which promises a recovery by Medicines. Truly there is no cure here, but what is heteroclitie (as *Aquapendent* saith) that with the Disease taketh away also the part affected, which is the most usual operation. But *Hieronymus* is too scrupulous, in that he would first take away the pain, and hinder the profusion of blood: for the pain is but momentary, and only small Arteries are cut.

Van Horne,
Microt.
121.

XXI. In the operation, first of all two Needles, or a double Thread are drawn across through the

Breast: Yet the Patient is not always to be tormented with the double pain of crossing the Needles; sometimes the *Carcinoma* is onely taken hold on with the left hand, viz. when it is pretty moveable. After the same manner you may conveniently take away remarkable Wens or Cankers, that grow in any other part of the body.

Idem, p. 127.

XXII. And the vessels that are cut must not be feared, but Medicines which stop blood must be applied.

Idem, ibid.

XXIII. In Cankers of the Breast it seems as if we should prescribe Repellers, to intercept the greater flux of humours, if we observe the part affected to swell daily, this being a token of a continual afflux, that should be repelled another way; and the part affected must be strengthened with moderate astringents, that it may not be so liable to receive the flux of humours. On the other hand, we have *Hippocrates* his Rule, *It is better not to cure occult Cankers*. Nay, if according to *Galen*, evacuators be more convenient than repellents in the *Parotides*; lest the matter should be driven into the Brain; how much rather should we abstain from Repellers in a Cankrous Breast, that is so near the Heart? Wherefore it is my opinion, that if we were in the beginning of a Disease that is but coming, then we need not abstain from some of the weaker Repellers, mixt with weaker Digesters. For which purpose it is my custom to make use of Oil of Roses complete, beaten up in a leaden Mortar, with a leaden Pestil, to a moderate consistence: for by the benefit of this Liniment I have more than once conquered Cankers as they were beginning. But we may not proceed to the stronger Repellers, neither in the beginning, because if the Spongy substance of the Breasts be condensed, the blood has recourse to the Womb, where it breeds a Canker: nor in the progress of the disease, because they hasten exulceration.

XXIV. *Magius* being called to a certain Nobleman that had a Swelling in his right Breast, which they took for a Canker, judged it rather to be a *Phlegmone*, because it was of no long standing. First of all therefore he ripened this Swelling with Wheat-flower boiled (as *Galen* teaches) in Water and Oil, and when signs of its ripening appeared, he opened it with a Knife; which being done, good matter ran out. But before opening, he felt some palpitations within it, which also argued the Tumour to be no Canker. Then he used Digesters, as *Turpinus Schenckius*, fine mixt with the yolk of an Egg, and cured his Patient.

Medicines especially made use of by eminent Physicians.

1. I have often used this Unguent for the Canker with good success; Take of Unguent, *Diapompholyg.* 3 ounces, *Venice-Treacle* 1 ounce, *Saturn* calcined with Nitre, and washed in Plantain-Water 2 ounces, Juice of Herb *Robert*, as much as sufficeth, to the just consistency of an Unguent. Keep it for use.

G. Fabricius,
cent. 6. obs.
7.

2. An Unguent of green Frogs is very good for a Canker (see the preparation in *Sennertus*.) ¶ Also the Broth of Craw-fish boiled in Ases-Milk, drunk five days successively, and this course repeated seven times, composes the pain of a Canker in the Breast.

Hier. Fabri-
cius, Cibi-
urg. l. 1. p. 1.
c. 27.

3. There is a Salt made out of the *Caput mortuum* of the preparation of Spirit of Soot, that is a most excellent thing in an Ulcerated Canker. This Salt is drawn off with Vinegar, and in some cool place is dissolved into a Liqueur again, and with this Cankrous Ulcers are several times anointed; The poison is drawn out visibly like a steam: Then the Oil of Soot gently sprinkled upon it, and frequently, brings a crust over it like a skin, which falling off in five or six days time, shews that the Ulcer is healed.

Job. Hart-
mannus,
prax. chym.
p. 18.

A. Fabricius

4. Fabricius asserts from certain Experience, that the following Water is admirable in curing Ulcerous Cankers. It is made thus; Take sucking Puppies, put them in Wine, and distill it half off in Balneo; then take the Puppies out, and boil them in a sufficient quantity of Golden-Rod-Water, or in common Water with Golden-Rod in it; when the Decoction is made, add the Water that was distilled off the young Dogs, and boil them together till the flesh come from the bones. Then distill them all in Balneo. Keep the Water for use. Wet dry clothes or rags in this, and apply it to the Ulcerous Carcinoma: For upon certain experience it heals the sore by cleansing and drying. I should add in the Decoction Leaves of Burnet, *Carduus Benedictus*, and Ash, which are commended by all Men for the Canker. ¶ This is one Man's Secret; Take of Quick-Lime wrought up thick with Honey, and burnt to powder in an Earthen Pot, and powdered, 3 drachms, Vitriol, Alum, Orpiment, Verdigrease, Sal-Gem, each half a drachm. Make a Powder, strow it on, and it cures the Canker.

Vigerius
oper. chi-
rurg. l. 1. c.
25.

5. The powder of a Milstone, or the Clayey Ruff that comes from a Grindstone, when you grind Tools upon it, applied either by it self, or mixt with Oil of Myrtle, and with the Juice of Nightshade, or Plantain, anointed upon the place is good to strengthen it after the cure of the Canker. ¶ The Oil of Eggs, rubbed in a Leaden Mortar till it grow thick, doth operate powerfully in easing the pain, palliating a cure in an Ulcerous Canker.

6. The Head of a Puppy a month old cut off and dried and powdered, mixt with Honey, and laid on an Ulcerous Canker, is said to kill it; or, wash it with Ivy-water, and then lay Ivy-Leaves upon it. ¶ Oil of Olives, with the Flowers of Wheat gathered in the Spring, set in the Sun for several days, is good to anoint an Ulcerous Canker. A Country fellow did stupendous things with this.

7. Mother of Time, black Hellebore, Fumitory, and things compounded of them, as *Pilula de Fumaria*, *Confectio Hamech*, &c. are especially commended for evacuating black Choler. ¶ The Fish of boiled Cockles, and Crawfish is good to ease the pain. But there is an Oil distilled from green Frogs per descensum, which is excellent both to give ease, and cure the Canker. ¶ Lead is highly commended by all men: Therefore all Medicines for this Disease are most conveniently prepared in a Leaden Mortar, with a Leaden Pestil. An Ointment of Lead may be made thus; if two thick Plates of Lead have Oil of Roses poured on them, and rubbed so long one against the other, till it acquire the form of a Liniment.

8. In a Canker that was not Ulcerous I have often used this Repelling and digesting Medicine. Take of old Treacle 1 ounce, Juice of Crawfish, Lettuce, and Oil of Roses each 1 ounce, Yolks of Eggs roasted in Embers, N^o 2. Camphire half a drachm. Mix them together in a Leaden Mortar. Make an Unguent.

Too hot, too cold, or too astringent things must not be put in them. XXVII.
They are most proper in essential diseases of the Head. XXVIII.
Medicines.

I. Physicians do not all agree, what Vein should be opened in diseases of the Head; yet it is altogether necessary a distinction should be made; and we must take good notice what the Laws of Evacuation from the whole, what those of Revulsion and Evacuation from the part affected do require. For in the beginning of the Disease we must not have respect onely to the Head, but to the whole Body also, and to the part whence the flux of Blood comes; and we must so order Blood-letting that it may doe good and not hurt, that is, that we may hinder the blood from running to the Head. Therefore in the beginning such a Vein should be opened, as may both evacuate the abounding blood, and draw it from the Head; but we must by no means in the beginning open a Vein in the Head it self. But if the fullness come from the whole Body, we must bleed in the Arm: if abundance of blood, and the disease of the Head proceed from suppression of the *Menses*, or *Hæmorrhoids*, we must consider the quantity of the abounding blood, and the greatness of the Disease in the Head, that depends upon it: For if the quantity of blood be less, and the Disease will give truce, we may bleed in the foot first, and that several times, because these Veins make both Abatement and Revulsion. But since these Veins in the feet, as being small, do evacuate the blood but slowly, if there be a great quantity of it, and the Disease be violent, and therefore present help be required, we may first bleed in the Arm, and

Sennertus, l.
1. p. 1. c. 3.

and then take care to recover the course of Nature. At length, when the Body is evacuated; and the Flux ceased, if the Illness go not off, a Vein may be opened in the Head.

Riolanus,
Anthropogr.
in fine l. 6.

II. The Circulation of the Blood teaches, how we may succour the Head, when sick: For if the Blood ascend to the Brain only by the Carotides, and descend by the Jugulars, to bleed often in the Arm will doe good: And Cupping bloody and dry, frequently applied to the top of the Shoulders, the Neck and Poll, hard rubbing of the Limbs both above and below, will conduce to the revulsion and derivation from and evacuation of the part affected. ¶ But Experience shews, that opening the Saphena does better and sooner quiet several cephalick affections, especially the Head-ach, than any Vein in the Arm: Perhaps the Reason may be brought from the same Circulation of the Blood, because the mouths of the Arteries lye here more open to the Veins, the Blood that is drawn thence is of a more arterious nature: The same Reason may be given for the *Sabatella* in the Hands; of the Efficacy whereof no one doubts.

Martianus
comm. in
Hipp.

III. Hippocrates, 2. Epidem. Sect. 6. v. 36. proposes a Vomit, for taking away a fulness of the Head, whereby it is successfully and quickly purged: and those that vomit know as much, for when they vomit, great store of Humours run out at their Mouth, Eyes and Nose. Wherefore, 4. Aphor. 18. Diseases above the Diaphragm, that want Purging, signifie, they should be purged upwards. And, lib. de loc. v. 173. sect. 2. In a Defluxion from the Head a Vomit is good. Therefore farewell they, that are so fearfull of a Vomit in Diseases of the Head, and think the Head is stuffed the fuller by it: For although in the very act of Vomiting it seem to be a little filled, yet because such fulness is from Vapours, which, as soon as the Vomiting is over, do vanish, we cannot say, the Head is filled by Vomiting. ¶ Extraneous Ferments, wherever in the Body they be bred, and the deeper Seeds of Diseases, can never be got out without the use of Vomits: but Vomits are found very beneficial in the Diseases especially of the Brain and nervous kind: for by this sort of Physick not only the filth of the Stomach and Bowels, that corrupts the Chyle and Blood, is plentifully discharged; but the Glands likewise, which are planted in the Bowels for Emunctories of the Blood and nervous Juice, are squeezed out, the choledochal vessels, and other receptacles of Excrements are abundantly evacuated, inasmuch that these being emptied are more ready to receive the recrements and superfluities of either humour, that would otherwise be apt to overflow the Head.

Willis,
Pharm. rat.
cap. 2. sect. 2.

IV. Galen's advice, lib. 1. *κρίσις* must be observed; that in all Diseases of the Head, whatever humour be the cause, Medicines that purge Phlegm must be mixt with the rest.

V. Paulus, lib. 7. cap. 4. writes, that they who give a Purge at night or after meat, doe harm, the Food corrupting, and the Physick working less than it should: Reason seems to confirm this, for so concoction is interrupted, distribution of the Aliment vitiated, and the Physick works imperfectly, its purgative virtue being weakened by the Food: But Experience contradicts it, which shews, that Pills given after Supper do purge the Head very well, without the forementioned Inconveniences; as J. R. Saltzmannus declares, in Hildanus, cent. 3. obs. 72. I light (saith he) not long since on Damascenus, and upon that Aphorism of his, wherein he orders, if you have a mind to purge the Head or any other remote part, that you give Pills after meat. But our Methodus medendi is contrary to this which persuades us to give our Purges, especially such as purge any particular humour, upon an empty Stomach, or if they are very strong to take a little Broth before them. I shall not here give reasons; But Experience confirms Damascenus his rule, for oftentimes in several cases our

chief Physicians give Pills after Supper with great success, as I after their example have done several times. And, to speak the truth, I have not yet observed a more present Remedy to purge the Brain from all superfluous humours. And, which is wonderful, they are given in a much less Dose than those that are taken in the morning fasting: They are taken an hour or two after a light Supper, sleeping upon them: About four, five or six by the clock in the morning they work gently, and without any grievous symptom, viz. reaching, vomiting, loss of appetite, gripes, or any other: And they may be repeated sometimes every night, sometimes every other night. And thus several have been purged by a little Dose, who before could not be moved with twice as much; when they took it in the morning fasting.

VI. It is also the opinion of many, that the Head is emptied better by Pills, than by Potions or Bolus's, because they draw more violently from the distant part, through their long abode in the Stomach: This indeed is certain, that Pills do purge the Head effectually; but they have this not from their form, but from the strong Medicines of which they are made. This mistake had its rise from a false supposition, that Purgatives taken into the Stomach, did draw the bad humours from the whole Body thither, which is not true (for were it so, Plasters to the Navel, and Purgatives held in ones hand, or smelled to, would not purge) but they doe it by transfusing something of themselves into the Body, whence there arises a commotion and fermentation of the humours, upon which the expulsive faculty being provoked, and driving the humours with the Purge headlong into the Guts, excretion follows.

Scennertus

VII. Do not purge the Head of a man in a Fever, lest he go mad; for purgative Medicines heat the Head, and the Heat that is in the Medicine joining the febrile heat, causeth Madness, saith Hippocrates, lib. de loc. in hom. Which to me seems very consentaneous to reason, and therefore if a man have a violent Fever, and especially in his upper parts or have his Head inflamed, or if his Head ake, or he be phrenitick, or if he have a great Ulcer, which cannot safely be irritated, I avoid Physick as much as I can, knowing for certain, that it affects the Head: Sleep shews this, which presently seizes them that have taken a Purge. If I can, I content my self with sharp Clysters and a low Diet.

Vallesius, 2.
Epid. 6.
p. 225.

VIII. In an Intemperature of the Head with Melancholy, always some Moistner must be mixt with Purgatives: Nor may a Purge be prescribed till the body be first moistned.

IX. The Ancients said, that Sneezers and Apoplegmatisms were indicated by excrementitious humours gathered in the Ventricles and substance of the Brain. This latter Age thinks not that these parts do empty the humours gathered there by the Nose and Palate; nor that what is evacuated, is excrements of nutrition gathered in the Meanders of the Nostrils and Membranes of the Palate and Jaws; but in some mens opinion they are bilious, phlegmatick, melancholick and ferous humours, derived thither partly by the Arteries from the whole body, and partly from the Salival ducts. For this reason they are indicated by the cacochymick impurity of the blood, diluted with much Serum, that its flowing into the Brain, its farther mixture with the circulated blood, and its approach to the more noble parts may be prevented.

Rolfinceus,
meth. med.
specialis.
p. 605.

X. If you make use of Sneezers, to unload the Brain in its Intemperature with Phlegm, you must abstain from violent ones, as Powder of white Hellebore, Root of Lily Conval, and the like, because of the great agitation they cause in the Brain, convenient onely for such as are in a Lethargy or Apoplexy; it is sufficient if you onely put a Fibre of the Root into the Nostril, and then pull it out again.

K

XI. Some

Quercetan.
Therm.
dogm. re-
fili. c. 13.

XI. Some think, that the use of Ptarmicks does rather encrease than hinder a defluxion of humours from the head to the breast, and that this should not be used but in case of extreme necessity, and universals premised. But in my opinion they are grievously out, seeing in great and sudden suffocating defluxions they are very properly and successfully used. For Nature hath ordained these Channels for the emptying of the Brain, whom Art imitating doth so promote, that in an open and free passage through this same way the course of the ferous humours is expedited and turned back. Avicenna uses a certain vaporous Sternutatory, made of very strong Vinegar, in which he dissolves a little Calor, the steam whereof causes violent sneezing.

Riverius.

XII. As much Extract of Tobacco, made with *Aqua vite*, as a Pease, laid on the Tongue, brings off a great deal of Phlegm. Exceed not this quantity; for if it get into the Stomach, it will cause grievous vomiting.

XIII. As often as the Head is indisposed by outward Cold of the Air, Water or Snow, or the Nose doth run, or they be troubled with a defect of animal Spirits, so often I have observed my Patients successfully and quickly cured, if, as quickly as may be, that be driven out of the Head again which was got into it, or any other part of the body, and was hurtful to them. And this either by one Sweat, or, which I prefer, by several; but they must be spirituous and volatile: because they must be such as not onely alter and correct the cause of the Cold and of other evils attending it, but amend whatever amiss is introduced into the body, contained or containing. For this purpose I commend the following Receipt: Take of Water of Fumitory, Fenil, each 2 ounces, simple Treacle or any other Aromatick water 1 ounce, Spirit of Sal Ammoniack 20 drops, Oil of Cloves 3 drops, Bezoaricum minerale half a drachm, Laudanum Opiatum 2 grains, Syrup of Red Poppies 1 ounce; mix them. Let the Patient take two Spoonfuls of this Medicine, and when he is moderately covered expect a Sweat, which he will facilitate and obtain his desire, if every half hour he take as much of it, till the Sweat burst out, for then he must use it more seldom and sparingly; he must use now and then some plain broth, with a little Wine in it, to repair his strength, and make him the more able to sweat the longer; for nothing does them so much good as a gentle Sweat sometime. As often as the natural and competent Secretion of the animal Spirits is hindered by an inward or aguish chillness, or by any other, that without an Ague fit doth now and then seize a man; so often by the like Sudorifick rightly used, the Sweat arising sometimes sooner, sometimes later, the desired Secretion of the animal Spirits, so necessary to humane felicity is sooner or later restored: for by help of this or the like spirituous, volatile and aromatick Medicine the hurtful and cold Vapour is dissolved and dissipated in Sweat or insensible Transpiration, which caused that dulness in the sense and lifelessness in motion. And whoever in such an internal or external Cold do think to cure by Bleeding, Vomiting or Purgings, they cast their Patients into greater hazards, even of Life it self, as I have observed more than once, &c.

Sylvius,
Trac. med.
l. 2. cap. 1.
sect. 31.
ad. 36.

XIV. The natural temperament of the Brain seeing it is very moderate, we should therefore use both inward and outward Medicines for the Head, with great caution, lest while we change its native temper, we bring some great mischief on this most noble part. Wherefore their boldness is not to be approved of, who attribute so much to those Waters called *Aqua vite*, being made of violent hot things, that they affirm all Diseases of the Head may be both prevented and cured by the use of these same Waters; not considering, that most Diseases of the Head do come rather from hot causes than cold, especially in those persons that are either

in their youth or manhood. Besides, in our Germany the way of most mens living is such, that there is scarce one in a hundred who gathers not a particular Plethora in his Head: Whence it happens, if the use of *Aqua vite* be prescribed to one of these men, that it, seeing it is altogether vaporous, immediately gets into the Head, and disturbs it, being full of various humours, and disposes it either to the Epilepsie, Apoplexie, or to dangerous Catarrhs. But that this opinion does not want experiment, you may understand from this, that those Apoplectic persons to whom these *Aqua vite* are given, do almost all of them dye or grow worse, as I have often observed, and do find it observed by others.

Oethaus, a-
pul Scheu-
kium.

XV. Some prescribe an Issue in the Coronal Suture to be made with a Cautey, and do commend it for drawing out and evacuating the humours from the Brain and its Cover. Although this is very familiar in some mens practice; yet I have known it succeed but ill with several, so that I have ordered many Issues, thus made in the top of the Head, to be stopt up, and that, convinced of it by reason as well as by experience: For the Blood transfers more Feculencies towards the place, where it used to lay its Recrements, and discharges them all thereabout, and especially in the part affected (as being weaker and more susceptible of them) whence it happens that the Disease is oftner increased than cured. For the same reason, namely, to derive the humours from within the Head to without, some dig fontanels in the Bregma, above the Coronal Suture, and others behind in the head, at the beginning of the Lambdoeidal Suture: but the same Exception is against this as against the former. But much better certainly doth an Issue in the Arm prevent the morbidick matter that used to be discharged on the Brain, one in the Leg makes Revulsion of it, and one made a little below the Head derives it thence. Therefore for the more grievous Diseases of the Brain or its Meninges in Infants and bigger Children, we cut a hole in the nape of the Neck; in grown Persons and old Men we make Cauterics on each side the Spine between the Shoulders, and there we make Issues big enough to receive several Pease, with great benefit. As for holes cut or burnt behind the Ear, or a Seton drawn through its carnosus lobe, I have seldom observed them to doe any good, but often to create much trouble; inasmuch as the Solution of continuity made in these parts doth not run much ichorous matter, nor long: for although the hole be stopt with a Pease or Pill, yet the skin will grow over it in spite of Wills ones Teeth.

XVI. Avicenna, lib. 3. fen. 1. tr. 2. c. 33. proposes Incision of the Arteries in the Temples, or burning them with Cauterics, for the interception of Vapours which ascend with the arterious blood through the Arteries; and he describes the manner, and things necessary for such an operation at large. And he orders three Cauterics to be applied to the Head, that the humours may be drawn from the Brain; two upon the Temples, to intercept the humours and vapours ascending from below, and one in the Nucha, or behind, between the Head and the Neck. But Jacobus de partibus doth not without reason add in his Commentary, Since most Patients will scarce admit of gentle Remedies, who will endure to be so often burnt? And therefore he advises the Physician, never to attempt the use of so many Cauterics, except they be earnestly requested by the Patient and his Friends: because it is a question whether by the use of them the Disease will determine, and it may be feared, when the Ulcers are healed, the Disease will return.

XVII. Whether is the application of hot things good for the hot intemperature of the Head? This hath been tried especially by our modern Chymists, who in a hot cause use the most subtille Spirit of Wine outwardly, that the Pores may be opened, and

and the hot Spirits drawn out by a similitude in substance; and this hath place in a hot Intemperature coming from a hot cause, but not in all; which is effectually performed by Camphire, drawing out the hot vapours by reason of its likeness, so making way by the tenuity of its parts for other Medicines, and not as is commonly thought: For Physicians being convinced by the evidence of the thing it self do well conclude it to be hot. Upon the like reason Snow and cold water are applied to the Limbs benumbed with Cold, and not cold but hot things to a Burn; so the Fish of Cockles outwardly applied fokes up all moisture.

XVIII. Three things must be observed in washing the Head, viz. that contrary to the common custome, the Head must so lean back, as that the Eyes may look upwards. To use bitter Almonds instead of Soap, and not to rub with too hot Cloths, nor overheat the Head with too violent rubbing.

Zecchius,
Consult. 27.

XIX. Washes prepared by Art doe the Head more good, and are used with less danger than Bath-waters. Some are of opinion that the Head is weakened with frequent Washing: And it holds good in a strong head, and one unaccustomed to washing; but of an infirm head, and such as is accustomed to wash off the filth, it is not true. We must wash in Summer time in the Morning, in Winter before Supper; and the same day the Feet must be washed.

Crato.

XX. For Epileptick persons, and those that are any other way troubled in their Head, a Plaster of Gumms is very good applied to the Nape of the Neck; from which a certain Nobleman, by the advice of an Empirick found much benefit. Either because it hinders the ascent of Vapours and hot blood to the Head, or because it wastes the vellicating Humours from the original of the Nerves. Three are laid on the Nape one after another, and there let alone till they fall off of themselves, which will last for some weeks; then the place must be washed with some warm water, and another applied. Thus Plasters of Tacamahacha, Caranna, &c. applied to both Temples and the Forehead do intercept the Humours that fall upon the Eyes and Teeth, and do bind the passages in the Veins.

Bartholinus,
Cent. 5.
Hist. 25.

XXI. Rubbing the extreme parts is commended, but such a rubbing of the Head as fills it with Vapours, and does not empty it, must be avoided. Let universal evacuation precede it, then let it be done in this manner, first, let the Neck, Arms and Spine of the Back be stoutly rubbed, then the Thighs and Legs, and last of all the Head: for then there is no danger of drawing Vapours or Fumes to the Head, because they are already diverted to the parts afar off. Thus it may be done, the Brain being first evacuated: Friction must be made in other parts of the Body with a course Cloth hot, but in the Head not with a very hot Cloth, it is sufficient if the Cloth be onely dry and not hot at all; and this must be observed in the Epilepsie, Apoplexy, Catarrh and other Diseases of the Head, that we begin our Friction from the Neck, descending by degrees to the lower parts, even to the Legs and Feet.

Rondeletius,
Pract. Med.
77.

XXII. Anatomists and Experience it self do shew, that the Heart has a great sympathy with the Brain: for the Heart supplies the Brain with vital Spirits, and in Swoonings it is known that the hurt is communicated to the Brain; so when the Brain is hurt, the Heart also sympathizeth: Therefore in an Epilepsie the trembling of the Heart does ensue, that malignity which troubled the Brain, being communicated also to the Heart. And the case standing thus, it will not be amiss in great hurts of the Brain, to apply comfortable Topicks to the Heart. I will confirm this with Experience; As I was upon Recovery from a malignant Fever, that had cast me into a Lethargy, upon any slight occasion I used to fall into Watching, which present-

ly brought me very low: Wherefore when I was once in great danger of my life, and I perceived not onely the Faculties of my Brain, but the Strength of my Heart to be much wasted, I applied a Cordial Epitheme to the Region of my Heart, and then I composed my self to sleep: And as the virtue of the Epitheme penetrated and strengthened the Heart, I perceived as it were a certain Beam ascend from my Heart to my Brain, which gave wonderfull Relief to my Head; afterwards I fell into a sweet Sleep. And after this, I perceived the same Experiment did good to others.

XXIII. I shall confirm the efficacy of Plasters to the Feet in Diseases of the Head, from a very rare Observation. Some years ago a young Dane being returned from a far Travel beyond the Seas, upon altering his Diet fell into a grievous Ophthalmia, or a *Chemosis* rather, the Balls of his Eyes starting out, and his Eye-lids inverted, he could neither endure the Light, nor the least Breath of Air, &c. so that neither I, nor a very skilfull Chirurgeon, could find any Remedy doe good to this growing and pertinacious Evil; but we were forced to make use of the last Remedies, which Hippocrates in the last Section of his Aphorisms commends; nor yet did the Patient perceive the least benefit by all these things; wherefore I thought with my self either to leave my Patient to the Prognostick upon the sacred authority of Hippocrates; or apply my self according to his rule, to undertake the Cure of this *Chemosis* another way. I enquire therefore more carefully and narrowly into my Patient's former course of life: He told me how he had undergone the greatest hardships, and that he was almost killed with his Toil in Candy, when he served the Venetians as a Foot-soldier: He protested ingeniously, he never defiled himself with those Vices, which are the fruits of Youth, and with which some Travellers of all Nations come home filthily polluted, like Dogs that have lost their tails. Seeing therefore this civil young Man did, among other things, complain of great heat in his Feet, for which he could not sleep; I ask him farther, whether his pain went some time off; or were continual, and whether new or old? He told me it was continual, and old. Therefore I ask him, how long since it began? He said, he could not resolve me that. I could not rest here, being willing to get out of him the true cause of this Disease or Symptome: wherefore, when, among other things, he had told me how he had travelled long Journeys and very fast on foot from Padua to Hamburg, and that he had performed this foot Journey in five weeks time. I began to suspect that the heat of his feet had overheated his blood, yet without a Fever, and that this blood either caused or fomented the Disease in his eyes. Upon this I had a mind to try how far carefull Reasoning could help practical Studies, or how much Anatomy (sometimes by Authours called useles, and which even Galen, 4. Anat. adm. c. 1. seems to style rather *wrangling* than *profitable*) could conduce to the Study of the Practice of Physick, or whether the Circulation of the blood could doe as much in curing an *Ophthalmia*, as it does in curing an *Agrypnia* (or Want of Sleep.) Therefore I obeyed Hippocrates, l. de loc. his Axiome, *That old Diseases must be made new ones*, that is, as I ever understood it, they must be pressed upon with new proper Remedies afresh, just as if a fresh fit of any Disease should come upon one: And I renewed the Cure of this *Chemosis*: Besides, in the fore-cited place He gives in charge, that *In Diseases, that a man understands not, he must give a violent Purge*, which Rule I followed, as Ariadne's Thread. Therefore, Universals premised, I commend to my Patient *Emplastrum Imperiale Jac. Fabricii* as a thing, whose excellent virtues I had often tried in asswaging Pains of the Gout; But because in this individual a bare hot Intemperature without matter had seized his feet, I mixed with one ounce of this Plaster of Nitre

prepared and Gum *Caranna* each half an ounce, and in five or six days time not onely the Intemperature of his Feet was corrected, but by chance also I found a Remedy for Corns in the Feet; for when the Soles of his Feet were uneven and thick beset with innumerable Corns, it happened, that by using this Nitrous Plaster they every one withered away. And by this method was this young Man freed from an enormous Ophthalmy, that had laid him up in a dark hole eleven weeks, who to this day (as it is now three years since) hath not suffered the least *Taraxis* (or *Bloud-shed*) in his Eye. Henceforth therefore let them hold their Tongue, who frowardly deny the Circulation of the Blood: for I verily foresee, that in future Ages, it will give light to many abstruse Diseases, even those they call Diseases of the Form. But here this *Quere* must be resolved, Why those things we apply to the Feet are commonly believed to benefit the Head? The Reason is at hand, Because by application of hot or cold things to the Feet or the Soles thereof, the Blood is quicklier altered by reason of the numerous *Anastomoses* of Veins and Arteries there, which being altered, is by means of Circulation carried to the Head: So Blisters applied to the Wrist either take away or abate the Fever: they take it away, when the febrile ferment, that is then in the Veins, runs out with the *Serum* into the Blister raised on the Wrist: they onely abate it when part remains behind. And cold Alteratives cool the Blood, as when we apply Nitre dissolved in Lettuce-water, or the pulp of a Lemon to the Wrist. He therefore that would have a care of his Health, would doe well, if by reason of the said *Anastomoses* he fence his Hands and Feet well against the injuries of the Air, and avoid such Objects, especially extreme cold ones. A certain person (saith the famous *P. Marquardus Slegelius*) being employed in clearing away some Ice, wherein he used an Iron tool, fell suddenly into a Swoon, the Cold being transmitted by his Hand to his Heart, &c.

XXIV. In all Diseases of the Head, most Men acknowledge, it is good to keep the Body loose; but few shew a reason for it. Now I think Costiveness is pernicious, not chiefly, because the matter retained in the Guts often hinder the necessary use of Remedies; but because Vapours are perpetually elevated from the matter retained, and from other Humours of the lower Parts, to the higher Parts of the Body, and especially to the Head: For these Vapours, while they continually affect the Head, otherwise afflicted, are not onely burthensome in quantity, but according to the different qualities disturb and corrupt the animal Spirits, whereupon all the ills in the Head grow worse, and new Symptomes frequently arise: Therefore it is good in all Diseases of the Head to keep the Body open.

XXV. It is very well known that Coriander is given to suppress Vapours arising from the Stomach to the Head: Yet some disapprove the use of it, because it is its nature to affect the Head, nor does it hinder the ascent of Vapours; but rather carry them with it self to the Head; yea, and according to *Dioscorides*, cause Madnes: But this is, if it be immoderately taken, which is common to it, with Saffron, Nutmeg, Frankincense, &c. yet this is no reason that it should be rejected, if moderately taken, especially prepared: For that vaporous and volatile part (as Chymists word it) that is in the Coriander, and which taken immoderately hurts the Head like Poison, is fixt and corrected by the Vinegar, so that it becomes a proper Remedy to help Concoction, and clear the Heart and Brain, as experience shews.

XXVI. Concerning Quilts and Caps we must take notice, that such as are made of very strong scented things do affect the Head, and cannot be endured of all people: And this is true not onely of Muski-

fied things alone, but of all strong smelling things in general, though grateful, if they be beyond measure such: And they make the Head to ache, and cause a turbulent motion in the Spirits: for this Maxim holds true here, *Every extreme Sensible hurts the sense*. Wherefore I have seen some, especially at the beginning, that could not wear these Spice-caps without the Head-ach.

XXVII. Nor yet must the Ingredients be too hot, nor too cold and astringent; not too hot, lest they melt over much, dissolve and precipitate the matter into the Vessels, which would gladly get out at Nature's High-way; thus hath a dangerous Fever come of a Catarrh, by unseasonable applying Oil of Amber to the mold of the head: We must have a care of Astringents, lest the Brain be hurt by powerfull Astringition, and the motion of the Humours be stopt.

XXVIII. Caps are most proper in essential Diseases of the Brain: They alter and strengthen it, that it is not so apt to receive Defluxions and Impurities: They discuss both the footy Vapours blended with the *Lympha*, and the abounding ferous Humours; They intercept, especially those that are made of Astringents, not so much, as the Head is the first Spring and Original of all Catarrhs, which nevertheless was the opinion of the Ancients; but as at least it is not altogether without fault, so the Moderns hold: Thus they keep back the shower of a Catarrh: Thus they stop the *Lympha* when it is running into the Pores of the Brain, and put a stop to all manner of Defluxions.

Medicines especially made use of by eminent Physicians.

1. Tincture of Amber is a Specifick in all Diseases of the Head, especially in Weaknes of Mind, A. Grulingius, l. 1. par. 2. co. 2. 1.

2. We have sometime strengthened the Head with this Remedy alone: Take of Nutmeg, Aniseed, Cinnamon, Marjoram, each 1 ounce; let them be bruised grossly, put in a Pipe and smoaked like Tobacco, morning and evening: for it wonderfully strengthens the Brain, and purges the Humours.

3. *Levinus Lemnius* saith, that *Lignum Aloes* doth wonderfully strengthen the Brain.

4. Take of Ly made of Vine ashes, what is sufficient: Boil in it some Marjoram, Bayberries, Pennyroyal, Calamint, Basil with the Seed, Agarick bruised and tied in a rag, 2 drachms. Add a third part of Wine to the measure of the Ly: Boil all to the consumption of a fourth part; press it and strain it, and in this Ly with some sweet Soap wash your Head. The Head will be wonderfully strengthened by this Washing. ¶ Oil of *Ladanum* rightly prepared, dropt into the Ears, and sometimes rubbed on the Crown of the Head is a most excellent Remedy.

5. I reckon this a curious external Remedy for strengthening the Head. Take of old Oil-olive, Cretian-wine, each half a pound, of the Wood and Fruit of Balsame, each 1 ounce; Flowers of Clary, Sage and Rosemary, each 1 handfull. Mix them, and let them stand in a Glas 3 days in Horfe-dung, then distill them. For 3 Liqueurs will come out, every one of them of great virtue, but the third of most. With the first the whole Head, being purged before, must be rubbed every day. With the second and a very small quantity of the third, the Sutures must be anointed, and one drop must be dropt into the left Ear, once in 3 or 4 days.

6. In a cold Intemperature of the Head black Helbore-root with as much Sugar-candy is an excellent Sternutatory (It is *Helmont's* Medicine) and is also good for the Cure of a Catarrh.

7. In a hot Intemperature of the Head it is good to snuff up cooling Liqueurs into the Nostrils, among which Woman's Milk, with Oil of Violets or Water-

Medicines.

I. **H**ippocrates in the Head-ach depending on a Cacochymy which is cured by concocting and purging the humours, abstains from Bloud-letting, as is manifest from lib. 3. de morbis, v. 14. because, the Brain being cooled by Bloud-letting, Concoction is hindered, and thence arises great Prejudice to the Patient, which Halicarnassensis perceived, who is mentioned 7. Epid. sect. 2. v. 462. Halicarnassensis his Ear ake in Winter, and his Head very much, now he was about 50 years old, he was let-bloud, his Head being evacuated and cooled was hurt, for no Suppuration was made, he became phrenetic, and died. For seeing the Patient could not escape this Disease, unless, as Hippocrates saith, the humour had run at his Ear, letting-bloud did cause Death, by hindring this running: Which I would have our modern Physicians, who let bloud so confidently, take good notice of. ¶ The Head-ach is either by Idiopathy, or by Sympathy from the Bowels below, and from the heat and evaporation of humours. The idiopathick Head-ach, when a Cacochymy is gathered in the Brain, or some cold Mass of humours, requires Purging; the other by Sympathy, Bloud-letting. So 5. Epidem. A Woman in Pheri that had been long troubled with the Head-ach, and to whom no body could give any relief, no, not when her Head was purged; yet she was better when she had her Menes easily; and when her Head did ake, she found benefit by Sweets applied to her Womb. Lo, a Head-ach by Sympathy from the Womb grew appeased by the discharge of Bloud and applying odoriferous things to the Womb. So 2. de morbis in Head-aches, where the Veins discharge the bloud into the Head, he makes no mention of Purging, but onely recounts the advantages of Bloud-letting: But in lib. de affect. speaking of the Head-ach by Idiopathy, these are his words, The Pains come from Phlegm that is gathered and moved in the Head, therefore if you will ease the Head-ach you must purge Phlegm. And 2. de morbis, when he had proposed a sudden Head-ach, with loss of Speech and throting, he lays the whole stress of the Cure in Purging. But Hippocrates, lib. de locis, intimates that Bleeding, not Purging, is proper in the Head-ach by Sympathy from some inflamed part or boiling humour, Purge not the Head of a man in a Fever, lest he go mad, for Purgatives heat the Head, and truly the heat that is in the Medicine added to the febrile heat, causes Madnes. For such a Head-ach is by accident, from the heat of the Fever, therefore we must not provide for the head by Purging, which would cause Madnes, but by such things as chiefly destroy the Fever, among which Letting of bloud has the chief place.

Pr. Martia-
nus, comm.
in V. 24. l. 3.
de morbis.

Sinibaldus,
Anipbon.
l. 3. Ant. 15.

II. One was held with a grievous Head-ach by Sympathy from the whole, by Bleeding in the right foot the pain was taken away from his head on that side, and after that, the same succeeded according to his desire on the other side also.

J. Rhodius
cent. 1. c. 1
obs. 73.

III. Nor must I conceal a present Remedy for a pertinacious Hemicrania, tried by Spigelius upon himself and several others, The opening the Vein that runs between the Forefinger and the Thumb.

Idem, obs. 504

IV. One that was grievously troubled with the Head-ach, through the violence of the Vital Bloud turned that way, made use of several Remedies, but all in vain; but at length letting bloud in his Temples he recovered: And this Bloud was of a florid colour, but of so thin and light a substance, that like a Sponge it swam upon its Serum: Its surface was smooth and shining, as if it had been covered with a fatty film: And the whole texture of it was so rare, that you could scarce touch it with the edge of a Knife, but it would sever into vari-

Tulpius,
lib. 1. c. 48.
OUS

ous parts. ¶ A Man of fifty was troubled with a sharp Head-ach for two years, which seized the right side from his Crown to his Temples: It would return three or four times a year, make him keep his bed, and bring him almost to despair, without either Fever, Thirst or Heat; but with a great beating in his Temples on that side. When I had tried many things in vain, and the Pain was violent, I proceeded to open an Artery in his Temples; the Blood leapt forcibly out to five ounces; his Head-ach went away in half an hour, and never returned. ¶ When the Arteries beat, the Pain is onely on the out-side, which the Physician ought to take especial notice of.

V. A Woman had been held with a violent pain in her head twelve days; her Physicians prescribed her Clysters, Purging, Bleeding in the Arm, Sheeps Lungs; her Head-ach continued, at last having applied Cupping-glasses to the part grieved, a great quantity of blood run out by Scarification, for stopping of which, Tinder made of Linen-cloth was strowed on it: And presently her Head-ach ceased.

VI. In the Head-ach oftentimes Matter lies between the Skull and the *Pericranium*: You must touch the place gently with your finger, that if you find any Matter there, the place may be opened, and much rather, if the pain be fixt in that very place. For frequently, when the place is opened, and the matter run out, the Patient has ease: and there may otherwise be fear of corrupting the bone. If any vein bethere, it may be opened, or cut quite through, unless it be very large. In intolerable torment of the head, that is also continual, and will not yield to other Remedies, we must use the Knife and Fire: for Purging, Cupping, Topical applications, &c. are found ineffectual, because there is a certain Heick intemperature and infirmity in the head.

VII. When I could not conquer a most stubborn outward Head-ach, coming of a cold intemperature with matter, by very strong Medicines, guessing, that either the *Pericranium*, or the Bone under the *Pericranium* was prejudiced by that matter, I proceeded to burning with good success, in which I always took care to run the hot Iron to the Bone (which I ever found abounding with moisture.) Sometimes I found the Bone it self rotten, which being scalded, all the Pain ceased. I did not make this burning behind or before in the Head, upon the Coronal Suture (as most use to doe, to divert the better) but on the right or left side of the Head, according as this or that side was pained, with success. But that men may know, how the Bone, while the Skin is whole, may be discerned to be carious, let them go to *Hippocrates, lib. 2. de morbis*, where he gives notice, that in such a case the Skin parts from the Head to this side and that, i. e. the Skin may be perceived by the touch to be parted from the Bone, which must be taken special notice of, because it is a certain sign that the Bone is foul.

VIII. The Chirurgicall means, commended especially for a cruel and inveterate Head-ach, is usually the burning or cutting an Issue in divers parts of the Body. Without doubt when they are made in the Arms or Legs, they are both less troublesome, and doe some good, inasmuch as they withdraw the fewel of the Disease from the part, and remove it far from that place. Moreover, an Issue in the nape of the neck, or a Seton in the neck, or in the tip of the Ear, or near it; also a pin of Bastard Hellebore root, put in a hole bored in the tip of the Ear, are often used with advantage, inasmuch as they evacuate many Serosities, and draw others towards the Emunctories, that is, the Glands. But now the most talk, and greater expectation is, of Issues made either in the very place grieved, or near it; so that large Issues are made in the crown of the Head, or upon

the joyning of the Sutures. If we measure the fruit of this Practice by the success, it will appear little and seldom profitable, but often unfortunate: for I never knew any cured of their Head-ach by such Issues; but several have been made worse by them. And Reason tells us plainly as much, for wherever an Issue is made, the Serous Humour flows thither from the whole Mass of blood, and consequently from the whole Body, and is often gathered there in greater plenty than that it can find a passage by that outlet; for which reason Inflammations, Pustules, and divers Humours gather about Issues. What other therefore can we think, than that Issues applied to the Head in the Head-ach, do cause more morbid matter to be gathered there?

IX. A young Maid had been above a year wonderfully tormented with a piercing pain in her Head. The Physician, suspecting (as it proved) that something lay on the Membranes, trepan'd her with good success: for when her skull was open, a small drop of foetid matter, scarce so big as a Millet seed, came out; nor did her pain ever after trouble her. ¶ N. had conficted several years with a most violent Head-ach, and he was cured by boring his Skull five times; onely his Head, the Membranes being cooled and thickened by opening, was a little dull. ¶ A cruel Head-ache, caused by the Pox, without *Gummata*, in a Man of 70, was eased by repeated trepanning (which laid all the corrupted bone open, whence Matter ran in great plenty) and returning at certain Intervals, it was then cured by the same means. ¶ I resolved to trepan a Farmer, who had got a most grievous Head-ach by the Pox, on that side where his pain was most, in three or four days after trepanning his pain abated, and in twenty days time he was perfectly cured. ¶ I trepanned a Woman that was afflicted with a grievous *Hemiplegia* (or half-head-ach) who was well, while the hole was open; but it being closed within a few days, she relapsed into her old disease. ¶ An ancient Man had been tormented three years with a cruel pain in his Head, he submitted himself to trepanning, it was done in the right side, and the fore-part, a little above his forehead, and he quickly recovered. Perhaps the vaporous matter that affected the Head, while it had no egress, caused pain; but when a passage was made, it went out daily. ¶ *Willis*, in his Chapter of the Head-ach, thinks, a Man can expect little good from Trepanning. Truly (saith he) it does not appear to me, what we can expect for certain from opening the Skull when it akes. If an Abscess lay there, this were the onely way of cure; but an Abscess would sooner cause drowiness, and mortal convulsions, than remove an Head-ach: If an Inflammation or Pustules, or *Erysipelas* had seized the *Diploë* (or the second place of the Skull) I know not whether these Tumours, exposed to the open Air, would more easily evaporate, or whether Remedies applied to them thus bare would doe any good or no: But if the pain be caused by any Tubercle, or Scirrhus, or Callous Swelling in the *Meninges*, I think, opening of the Skull will doe very little or no good at all.

X. A Woman had endured pain for some years about her forehead and eye-brows: A certain person rubbed and pulled the lax tip of her Ear, till a Vein appeared, then he cut it with a piece of a flint, that Men strike fire withall, it bled very black Blood; and by this bleeding she was cured.

XI. A Nobleman 30 years old had laboured under a Head-ach, with a Catarrh falling on his Breast, and an extenuation of his whole body for several years: After I had applied potential Cauteries to each arm, he was first freed from the pain in his Head, and then perfectly from his other symptoms: I could produce many such examples.

XII. A certain Person was troubled with a most bitter Pain in his Head, taking and leaving him at set hours, which periodical pain lasted fourteen days,

37.

¶ A Girl about seven years old had been troubled for two months with a grievous pain in her Head, returning once almost every hour so sharp upon her, that she wished her head were cut off: An Epileptic fit took her out of this life: The Substance and Ventricles of her brain were found full of Serous Humour. ¶ Another Maid, who had been long afflicted with such a pain, had her whole head shaved by a Chirurgion, and covered with a Vescicator like a Cup; when the Blisters were raised, it run great store of Serous Humour, and so she was cured. ¶ The Ancients frequently used Phlegmisms and Sinapisms; and it is the Modern Practice in violent Head-aches to apply Vescicatories sometimes to the fore-part, sometimes to the hind-part of the Head: Now, whenever ease is found by these fiery Topicks, it is because great store of sharp Serum is by such administrations discharged from the part affected.

Willis.

XIII. A Matron was troubled with a tedious and bitter pain in the left side of her Head: About four years before, she had been troubled with the Tooth-ach for six weeks together in her left jaw, which going off was attended with a pain on the same side of the Head: Hence I knew, the *Hemicrania* had its rise from the roots of some rotten Teeth; for four of her upper Teeth were rotten, and their roots stuck close together, which when they were drawn out, the grew perfectly well.

XV. A Woman, too well known, was sick of a most cruel Head-ach, it was wandering, and worst at night, which made me suspect it to be Venereal, because there were besides spontaneous lassitude of Body, slothfulness and dulness to motion, sometimes thickness of hearing, with a tingling in her ears, &c; but especially because she had often used Mercurial Unctions, and Pills: I judged the pain was produced by some malignant Quality of the Mercury, that was got into the Brain: Therefore I twined two pieces of Gold round, and put one in each Nostril, and when she had kept it there some hours, it was taken out, and appeared tinged with Mercury: she held a piece of Gold in her Mouth, and that was taken out white also, and put in the fire, it recovered its ancient colour: And by this course often repeated her Head-ach was removed.

S. Jacos. id

XVI. A phlegmatick Person about forty was troubled with so cruel a Head-ach, that he could not endure the least noise, so that if one slept but into his chamber, he thought a Knife was run into his Brain. Many things were used to no purpose, at last I perswaded him to have a Seton made, which succeeded so happily, that he daily found a manifest abatement of his pain. After half a year he let his Seton close, instead whereof I made him an Issue in his Arm.

XVII. A Nobleman having the Pox, was among other symptoms taken with so violent a Head-ach, that every evening he not onely doted, but was taken with such cruel Convulsions, and Fainting-fits, that the By-standers thought more of his death than recovery: Which cruel symptome would yield to no Medicine at all taken inwardly, till at last I applied *Emplastrum ranarum cum Mercurio*, upon which the pain went miraculously off within half an hour, and never came again.

XX. One was complaining to me, how miserable his life was, through want of sleep, which a grievous Head-ach had brought upon him, now well-nigh a year, which was enraged by touching, and grew worse towards night: When I had felt his head, and found an humour settled under the Skin; besides this, the bitterness of his Pain, and his continual watching, gave me suspicion of some Infection: But on the contrary, whereas I knew him now in a lively old age, and that he had ever been of unspotted reputation, and free from any dishonest disease; and that his temper was Melancholick, and I see with my own eyes, he led his life exposed to the open air; then indeed I thought the humour, the continent cause of that Swelling, was a watrish one, but mixt with a sharp and bilious *Ichor*. When he had used all things to no purpose, I cause a Caute-ry to be immediately applied to his head behind: It was no sooner done, but a greenish water, much like green Choler, came away, and that for several days, and so he recovered.

C. Pilo; de
colluvie se-
resid. p. 51.

XXI. I cannot but remember that healthy Scurf, which did very seasonably deliver N. from an inveterate Head-ach, the Viscid Phlegm being expelled by the insensible vent-holes of the Skin, and sticking to the roots of the hair like glew, and by little and little producing a true Scald. Hence let Physicians learn how to imitate Nature, and with judgment observe, of how great use, both sneezing seasonably provoked, and Issues timely made, are: for Nature is the best guide.

Tulpius, *obs.*
l. i. c. 32.

XXII. A most bitter Pain racked a Woman, creeping with manifest sense of heat, sometimes from her foot to her head, and sometimes from her head to her great toe: Into which, when it was come down, I ordered a Cupping-glass immediately to be clapt to it, to get out that Volatick Spirit, which daily ranged the whole body with so swift a course; and when it was drawn out, I found those reciprocal circuits did cease, and the Patient cured.

I lem. l. i.
c. 33.

XXIII. Whether may a Purge be given in every Head-ach? *Rhazes* purgeth both in a Bilious and Sanguine, because the thinner part of the blood may easily turn into choler: *Avicenna* prescribes it in a Head-ach, caused by an immaterial intemperature of the head, as by the heat of the Sun, that the hot humour being carried off, the head may be cooled: He also purges in a cold immaterial Head-ach, that the cold humour being purged, the head may be made hotter: He purges for prevention sake, that he may decline the imminent danger of a Flux of humours, which pain doth raise: ¶ *Hol-lerius Perioche 2.* tells us, we must take notice in the Head-ach which is caused by Vapours, whether those Vapours be bred of Food, or of other Matter: For if they be bred of Food, Purging will be to no purpose; if of other matter, he bids us distinguish; for if the matter be small, and contained onely in the head, it must be got out by other Medicines: If it be much, or gathered in the whole body, we must Purge; But if it be thick and cold, we must first use preparatives and incisers: Which, if it can be concocted, and the Phlegm be sweet, he says, it needs no Purge; if salt, putrid or corrupt, we must of necessity Purge.

XXIV. A greater Dose of Physick must be given in the Head-ach, both because the humours ascend, that revulsion may be made, and because the sense of the parts is less exact, by reason of the resolution or retraction of the Animal Spirits. ¶ While the head glows with pain, all the humours, because they are inclined upwards, will not easily, by Physick,

Rondeletius
Fr. c. 7.

sick, be persuaded downwards; therefore the Purge must have a more lively virtue than ordinary, that the working may answer expectation.

Ætius. XXV. Clysters for the Head-ach will not admit of things that fill the head, Cummin, Fænugreek-Seed, Nitre, and other odoriferous things.

Mercatus. XXVI. In the Head-ach, and also in Fevers, we must not be too sparing in giving Syrups and Potions: but we may give to grown persons ten ounces in a Potion mixt of Syrups and distilled Waters, because in a less quantity they will not reach easily to all the Parts, and to the head.

Frid. Hofmannus, m. 4. l. c. 12. XXVII. In a Head-ach caused by serous humours Diureticks are of great virtue, to carry off those that tend to the head, while they derive them with themselves, as they are circulated through the mass of blood: for Diureticks, after they are carried with the chyle to the heart, and from thence by the *Arteria Aorta*, with the blood, into the whole habit of the body, do lead the noxious, tartareous, gritty matter, and the filthy, salt dregs, to the urinary passages.

Idem, ibid. XXVIII. Sweats indeed are not proper in essential Head-aches, because the serous morbifick matter is thereby more and more moved upwards towards the head: But in a Symptomack one they are more requisite, especially if the *Hypochondria* blow the coals, or an Itch be driven in: And this may very well be done in the cure of a *Vertigo*.

J. Langius, Epist. 30. l. 2. XXIX. *Galen* advises those that are drunk to wash with warm water the next day, and after washing to lye down to sleep, that they may concoct their crudities: Yet he would not advise washing in every Head-ach; but then to do it, when the head is hot, without a Fever, and after washing to eat Lettuce, and sup some Pisan.

Willis. XXX. Plasters are very convenient, and often prove very beneficial; they must not be very hot, and such as draw the humours to the place affected, but moderately discutient and strengthening. I usually prescribe *Empl. de minio*, or *Diasaponis*, with half as much *Empl. Paracelsi* to be applied to the head when it is thaven.

Idem. XXXI. Liniments of Oils and Unguents, though often used, doe little good; inasmuch, I think, as they make lax the tone of the fibres, if they penetrate deep, and so they lay more open to the incurfions of morbifick matter; Moreover, they so stuff the pores of the skin, that the *Efluvia* cannot evaporate.

Idem. XXXII. For the same reason hot Fomentations of Aromatick Decoctions, and other Cephalicks, often doe more hurt than good, inasmuch as they draw the humours towards the parts, and also open the pores and passages, that they may more easily be received. Therefore it is, that bathing the head, or Embrocation of it with a Pump in the hot Bathes is used to persons in the Head-ach, with no better success: When on the contrary it has done several good, to wet their Temples and Forehead with cold water morning and evening; yea, every morning to embrocate the whole head with cold water at a Pump, or at least to dip into a deep Vessel, or Well.

Zecchiuss, consulti. 16. XXXIII. In the use of local Medicines, we must have a care of all that have *Euphorbium* in them, indifferently used by many people; for *Euphorbium* is hot in the fourth degree, whence it is, that it exulcerates, and causes redness and inflammation: Wherefore *Galen* indeed, 2. de Med. local. used such a Medicine in a *Hemicrania*, coming from a cold Phlegmatick humour. But instead of this, there is one Medicine to be met with, that without any redundant heat, doth wonderfully draw out all the humour that causes the pain, though it lie never so deep: It is made of the fish of Cockles, pounded in a Mortar, and reduced to a smoothness, with a little *Frankincense* and *Myrrhe* in Powder; for the fish of

Cockles draws all the superfluous humour from the inside outwards.

XXXIV. When the Head-ach is so cruel, that the Patient is in danger of his life, then there will arise an Indication of taking away sense; yet, with great caution, seeing it cuts not off the morbifick cause: However, when the Patient grows weak, is in much pain, cannot sleep, and is in danger of a *Delirium*; we may so long resist pain, till he recover strength: Let the scope of Narcoticks be gaining of strength; we must begin with the milder sort, and first use them outwardly, then inwardly. Take this for a caution, Never apply *Opium* to the coronal suture, for the brain lies much under it, and the entrance thither is easie; but rather to the Temples, Nostrils and Forehead, though *Rhazes* put a little into the Ears. When the pain is ceased, and watching overcome, let the place be anointed with oil of *Chamæmil*, *Nutmeg*, &c. to take off the strength of the *Opium*.

XXXV. Salivation raised by *Mercury*, if so be it succeed aright, sometimes removes difficult and plainly Herculean diseases, and such as turn a deaf ear to all other Remedies: Inasmuch namely as this operation doth perfectly purge the blood and nervous juice, and the other humours, by a long spitting, destroy all exotick ferments, rectifie all enormities in the Salts and Sulphurs, and besides removes, and often carries off the morbifick matter settled and overflowing every where. Yet this Medicine is not without hazard; inasmuch namely as the *Mercury* becoming unruly, and carrying along with it a great quantity of very sharp, and in a manner poisonous *Serum*, and so rushing impetuously into the noble parts, and especially into the brain, with the medullary and nervous appendices, or into the Lungs, and about the Heart, leaves an indelible and sometimes mortal fault upon them. Wherefore in an old and grievous Head-ach, there is danger, lest the fibres being indispofed by the *Mercury*, and much corrosive *Serum* passing through them, should be more irritated, and be cast into greater spasms, and painfull corrugations: and farther, lest

the brain be invaded by the violent motion of the humours to the head, and then, which happens too frequently, sleepey, or convulsive diseases be brought on. ¶ Some, for inveterate Head-aches, after once or twice purging, fly to Quicksilver, wherewith they rub the head and other aking parts: These Men,

though sometime they remove the Pain, yet they always increase the Cause, and cool and moisten the brain more. ¶ There are some that commend *Empl. de Vigo cum Mercurio*, because it has been observed, that it hath put an end to an inveterate Head-ach, having evacuated much phlegmatick humours by spitting. ¶ Salivation terrifies several that are employed in inventing dissuaves against it: but experience dispels this vain fear. One that was sick of a grievous Head-ach, and miserably afflicted with it, being salivated, recovered under our care; and there was no sign of the Pox in him. ¶ *Willis*, in the place fore-quoted, approves of Salivation in the Head-ach arising from the Venereal Disease; In other cases he disapproves of it, and produces some examples of ill success.

XXXVI. An *Oxyrrhodinum* may not be applied in every Head-ach; Abstain 1. When a Catarrhe is joined with it, for the application of cold things increases the distillation, and by its driness strains out the humour down to the Breast; yet *Trallianus* allows it, when the Head-ach has its original from the violent heat of the head, which draws the humours like a Cupping-glass from the whole body; this way it does good by taking away the cause.

2. When plenty of gross humours or vapours cause the Head-ach; in which case *Oxyrrhodina* doe more harm by obstructing, than good by Repulsion. 3. If the Head-ach be critical; you may reckon it critical, if in a Fever it fall upon a critical day, if signs

Willis de cephalalgia.

Encheir. med. pr.

Ibid.

Rollinc. meth. spec. p. 164.

Hernius,

of Coëtion have preceded: yet if the *Crisis* should be by Vomit, they may safely be applied; otherwise, if Bleeding at the Nose were drawing on, by driving back you would cause Death. 4. They doe harm, if blood or another humour be firmly settled in the head; for then Digesters must be made use of, as *Galen* 13 m. m. 6. adviseth. 5. In a Head-ach that is malignant, or contracted from the Bite or Sting of a venomous Creature; the Venom must rather be drawn outwards by Rarefiers.

Hallerius,
Period. 2.

XXXVII. In the Head-ach caused by heat the juices of Purslane, Housleek, Kidney-wort, and other things of the like nature; but these things must be fresh, not parched with heat and without juice. Vinegar is good in Liqueurs; but it is forbidden to Children and tender Bodies.

Oethaus.

XXXVIII. It is known that some Empiricks rashly undertake that they can cure all sorts of Head-aches with their Cephalick waters, whereby many have been brought into perpetual tortures in their head. I knew a Nobleman, then but young, who, suffering a violent Head-ach from the ebullition of hot blood, through some bodie's persuation washed all his head in very strong *Aqua vita*: but by this unskilfull advice he was almost cast into Madness.

XXXIX. Castor asswages pains in the Head coming from the Womb, saith *Hippocrates*, lib. 7. de Epidem. and lib. 6. Great pain about the forepart of the Head, and what-ever others arise from the Womb. Now, indeed, that Diseases by Sympathy are removed by curing what is first in fault, and that this is the legitimate way of their Cure, is very well known. But Castor is commended for all Uterine Diseases (I say those that are improperly called Uterine, such as Fits of the Mother, whether they be caused by suppression of blood or feed, or by wind) by the joint consent of all Physicians. *Hippocrates*, in lib. de morb. mulier. makes frequent mention of it: for the same purpose lib. 2. he prescribes Castor or Fleabane. Therefore Castor taken inwardly cures the Head-ach from the Womb, but then it cures Diseases of the Womb that are accompanied with the Head-ach, i. e. Suppressions of the Menstrua, retention of Seed, and of the cold juices and wind. Nor does it cure all Diseases of the Womb, but onely cold ones; for it will rather increase Inflammations and the Erysipelas. Wherefore since the head may ake for Inflammations of the Womb, it is clear that Castor cures not all Head-aches from the Womb, but such onely as come from its cold Diseases, such as *Galen* affirms Fits of the Mother to be.

Vallesius,
Epid. p. 865.

XL. It may so happen, that a Disease of the head, or of any one place may increase or grow better with the Disease of another part or place; nor yet for all this be affected by Sympathy from that other part: for it may chance that matter may flow from the self same fountain to divers parts at once, and there may be no pain in the part that sends it, nor any thing amiss known or perceived there: As *Hippocrates* observed it happened to *Agessius* his Daughter, 6. Epid. 3. 4. who when she had a pain in her hip, was oppressed with an *Asthma*, and when her pain was eased, she took her breath well. Now seeing there is no communication between the Hip and the Breast, it was very reasonable to suspect, that the humour ran into each part from the same place, and was dispersed at the same time. The flux might be from the Brain, or it might be from the Womb; And therefore when two effects happen together, a man must diligently observe, whether the communication be from the head or from some other place. Although *Galen* in his Comment upon this place, says, that an Imposthume was broken in her breast, and when she had raised the matter, her *Asthma* ceased; but upon small ground: for it is more reasonable to think, that in a Woman newly delivered, the pain in her Hip came from the Ligaments of the Womb, and her *Asthma* from the Sympathy of her Breast with the Womb, and espe-

cially when she did not cleanse well, which caused both these Ails, and both these Accidents ceased; when she did cleanse: For the Womb in Lying-in-women, is the occasion and root of all their Evils, and there is a great Sympathy between the Genitals and the Breast.

Casper.
Cald. Il-
lustr. & Obs.
Med. 8. l. 2.

XLI. That it is requisite the outer substance of the Brain and the *Cerebellum* should be open, to the end, the most spirituous part of the Blood may penetrate it, and be as it were percolated through it; the cold of the Air, Water or Snow, vehemently affecting the head seems to prove; after which not onely a Rheum, but a more spare production of Animal Spirits uses to follow. But whoever upon taking such a cold do let blood, or think to take away the cause of this evil by purge or vomit, they endanger their Patient's life; as I have more than once seen it done by men, that are more conversant in Books than in Observation of Symptoms that betide sick persons.

Sylvius de
le Boë, p. m.
402.

XLII. I think the inward Cold of the head is caused by Vapours breeding Cold, carried to the head together with the blood, partly indeed by their austerit rendring the blood inept to part with its spirituous parts, and partly contracting the external substance of the brain, or straitning its sinuous pores, and so in some measure at least denying a passage to the most spirituous part of the blood. Then is the time to sweat; for by this means the Vapours, that produce the troublesome Cold are dispersed. But in this case, as in the foregoing, it is hurtfull to bleed, purge or vomit.

Item, ibid.

XLIII. The nervous Liqueur gathered among the Fibres of the *Meninges* and other parts of the head, sometimes by its proper incongruity, whereby being sower or otherwise degenerate, it becomes disproportionate to the Fibres; sometimes, for that it ferments with some other humour, viz. the nutritious or serous, flowing thither, doth vellicate the containing parts and irritate them into spasms and painfull distensions. When it is thus morbidick, it is either peccant in the whole mass and inflicts its mischief on the head predisposed: or in it self innocent, is so affected within the fibres, that it is perverted, and so secondarily it becomes morbidick: The cure of which then depends upon the restitution of the containing parts, namely, if the weakness of the fibres, or the hurt conformation be amended, the humour that bedews them will immediately be without fault. In the mean time, if, being degenerate in the whole mass, it impart its mischief to the head prepared for aking, such Medicines and method must be used, as may reduce the nervous juice to its due crasis, that as it gently traverseth the fibres it may not irritate them. For which purpose neither strong Purges, nor large and frequent Bleedings are convenient, because they put the blood and humours into violent motion, and waste the strength; and therefore impress a greater acrimony upon the peccant nervous liqueur: Yet gentle Solutives and a little bleeding will sometime doe service, that the bowels may be cleansed and the mass of blood a little purged, and way may be better made for succeeding Medicines. Now the Medicines that render the nervous liqueur more amicable and benign to the Membranes of the head, which use to be disturbed by it, are such as are vulgarly held to be Cephalicks, scil. whose particles being active enough and also thin and subtile, do pass the blood without turbulence or tumult, and then insinuating themselves into the nervous liqueur, they gently astuate it, and so make the nervous ducts to open themselves, so that all sensible and motive bodies do more freely irradiate the animal spirits, and inspire them with Faintings, Spasms or Distensions.

Willis, cap.
de Cephalak-
gis.

XLIV. Sometimes the nutritious juice is the cause of a periodick Head-ach, scil. inasmuch as it being mixt with the blood, and not rightly assimilated,

lated, by reason of the disagreeing particles it gives it a turgescence, so that the blood boiling up into the head, leaves its Refuse in the *Meninges* and those parts of them that were predisposed, and so irritates the Fibres into painfull Spasms. For this very reason I have known several after the Small-pox and Measles, and other Fevers or Sickneses, whereby the mass of blood is usually vitiated, who were subject to the Head-ach every day, viz. so many hours after eating, sometimes sooner, sometimes later; first a flushing in their face, then a fullness and pain in the head did invade them. Moreover, they were more grievously plagued upon drinking Wine or eating windy Meats: The fit of the Head-ach was more or less distant from their food, altogether as the Chyme began to grow turgid either upon its first entrance into the blood, or after some little stay there. After provision for the whole, Medicines which restore the crasis of the blood, doe much good, such as Antiscorbuticks especially; and Chalybeates.

Idem.

XLV. One infected with the Pox was cured by a sweating Diet and anointing with Mercury, after which for some time he seemed free of his Disease: But afterwards the same Distemper returned, and he was again cured by using a Sudorifick decoction a good while, and then by a *Suffilus* of Cinnabar he seemed again to be perfectly cured: Yet afterwards he began to be afflicted with a grievous Pain in the left side of his head, which in the changes of seasons, especially at the coming in of Autumn, tormented him sorely, and kept fixt in the same place like a Nail. Many Medicines were tried to no purpose. I judged this grievous Head-ach did proceed from the reliques of the Pox that was not perfectly cured; yet that its next and immediate cause, or at least the fomenting and encreasing cause of the pain, besides the Venereal virulence, must be either a sharp and biting humour flowing to that part of the head, or Mercury it self gathered in that part of the head, or a *Caries* in the skull. That I might have respect to all these causes, 1. I prescribed universal Evacuation by bleeding and purging with an Apozeme for four days; then a Sudorifick diet of a Decoction of *Guaiaicum* and *Sassa* for thirty or forty days: for often a Pox that could not be cured by Mercury, has been cured by long use of the Decoction. And if the Head-ach came onely from virulent humours, vellicating the membranes, it could onely be cured by a long diet. If it would not yield to the long use of the Decoction, we ought to see, whether no Mercury were gathered in the part, which may be known, if a Bullet made of Gold be put deep into the left Nostril, and if after some stay in that place it be taken out white, it is a sign there is Mercury: You may try the same by covering a cephalick Plaster with Leaf-gold, and laying it on the part grieved: for, if the Gold grow white, it is a sign there is Mercury, which may be got out by degrees, if a thin plate of Gold be always worn upon the aking place, and a golden Bullet be often put into the Nostril. If by this means neither, the pain do cease, the place must be laid open and bored; for often the *Cranium* is corroded by sharp, virulent humours, and a *Caries* is got into it, when the Skin remains whole: And though no *Caries* should appear; yet the Trepan often does good, by drawing out the virulent matter, that was gathered upon the *Meninges* of the Brain.

Riverius, Cent. 2. Obs. 51.

Medicines especially made use of by eminent Physicians.

Acus, Te-
trab. 2.
sett. 2.

1. *Euphorbium* has a natural power to cure the *Hemicrania*, thus used. Mix it with Vinegar, if the right side ake, anoint the left; if the left side ake, anoint the right; it gives present ease. ¶ Give French-lavender boiled in Water, or in Water and Wine, as the best Remedy in all Head-aches: Or, beat wild

Docks and Galls together, apply them to the Temples, and you will presently cure.

Id. c. 50.

2. If you dip a crust of bread in the Phlegm of Alum mixt with the Phlegm of Vitriol, and lay it on your head where it akes, you will admire the effect.

Agricola in Poppium.

3. Bitter Almonds blanched, beaten up with Vinegar and Oil, and dropt on or applied to the forehead, like an ointment, are very good in the beginning of an Head-ach.

Donab. Altim. l. 1. c. 10.

4. There is a singular Remedy for the Head-ach lately found in England, made of the Walnut-tree. In the beginning of the Spring, before the Leaves bud out of the Walnut-tree, they dig up the Earth round the Root, and having cut the Roots, they draw out the Sap, and give a few drops of it in the Head-ach with great success.

T. Bartholin. cent. 3. biff. 97.

5. I set a great Value upon this Epitheme, made of the Flower of Sulphur, tied up in a Rag, and boiled in White-wine, till it grow white: for it gives present ease to the most violent Head-ach.

Claud. Decadatus.

6. An Ointment often tried by me in great heat and pain of the head. Take of Oil of Violets, Roses, each 1 ounce, Vinegar half an ounce, Camphire 2 drachms. Mix them; make an *Oxyrrhodion*, apply it to the forehead and often repeat it.

Leonet. Faventinus.

7. This vulgar Remedy hath been often tried with great success; Take a Turnip, roast it in the Ashes, when it is roasted, cut it in half roundways, then take that half the herb grew to, and apply it behind the Patient's ear as hot as he can endure it, when this is cold, take the other half and apply it hot, and repeat it till the Wind be dispersed and the pain removed: In the Tooth-ach caused by Wind it is very good used after the same manner.

Joh. Fienus, de Flatibus, c. 14.

8. One in a continual Fever had a great pain in his head; I ordered Yeast with Salt and Soap spread upon Colewort-leaves to be applied to his feet, his pain went off; I have tried this in several others.

Forestus, obs. 16. l. 7.

¶ In the Head-ach, caused by the heat of the Sun, I ordered Oil of Roses to be applied, which is one of the best Remedies, if it be made of crude Oil, and Roses alone, without the Leaves; it is also much better, if it have no Oil in it.

Id. l. 9. obs. 14. c. 2.

9. Kernels of Peach-stones beaten together with Betony-water and Vervain, helps wonderfully in the Head-ach from a cold cause.

Grulingius.

10. It is confirmed to me by most faithfull experience that 10 or 12 Leeches set round the Temples, when they have drawn much gross blood away, the Patient finds relief: and this is a much safer remedy than cutting an Artery.

Hearnius.

11. This is commended as a Secret by some, which like a Charm asswages all Head-aches. They bid you set a Dish upon the Patient's head full of fair Water, and pour about two ounces of molten Lead into it, which being done, they hope the pain will be removed with the Dish.

Rohinc.

12. Among external Anodynes in the hot Head-ach, the Juice of Creyfish is commended from the often experience of Dr. Michael, if the Juice of Vervain be mixt with the Juice of the Creyfish, and Cloths be dipt into it and applied to the Temples and Forehead; it is good also in the Malignant head-ach and the Hungarian disease.

Phil. Jac. Sack Gammalogia.

13. Take 2 or 3 Tiles and heat them, pour some of the best Wine upon them, and let the Patient receive the smoke into his mouth with his head covered: This must be done twice or thrice in 24 hours, thus I have cured several.

Arnold. Villanovanus.

- Medicines.

I. **I**T is customary with unskilfull Chirurgeons, when they are called to cure Wounds, that reach not beyond the Pericranium, to open all Wounds whatever in the head with a large Incision in the figure of a Cross, and (that I may use their own phrase) to lay open the Skull, to the end they may know whether it be broken or cut. From which mistake of theirs many Inconveniences follow: Because, first, it protracts the Cure, for if such Wounds or Contusions were cured according to Art, they would be well in eight, or at farthest ten days, though they were very large; whereas

these fellows scarce cure them in two, or sometimes three Months. Besides, while they open the Wound to the Skull, they endanger the Patient's life, because sometimes, before he is cured, they must of necessity take out no small portion of his Skull, it being corrupted by the open Air getting to it, which otherwise had neither been corrupted nor hurt: And it often happens, that not onely the Surface, but the whole Thickness of the Skull is corrupted. One had a Wound in the right side of his head laid open in form of a Cross three Inches square, when there was not the least sign of a Fracture: whence it came to pass, that not onely so much of the Skull as was laid open, but a greater Portion on all sides, was corrupted. ¶ If it chance, that upon a blow a Patient lose his Understanding, with a deprivation of sense or motion, unless the other symptoms enumerated by Hippocrates do also appear, there is no danger of Life: and therefore you must let alone all manner of operation, as laying open and trepanning the Skull: for I have seen some, who, having their head hurt by a fall or a blow, and this Symptom onely appearing, were well the next day. ¶ Such a Contusion is with admirable success cured by applying the Skins of new killed Animals, especially of a Dog or a Mouse; for if they be applied while they are yet hot to the contused place; and left on for 20 hours or more, they notably disperse the Tumour: I prefer a Lamb's skin, being both easily come by, and having as good a faculty to digest. By this one and well experienced Remedy I have cured several children and grown persons.

II. There are often in children under 7 years old Contusions, very like those faults we see in brass Vessels, so that when the Skin is not hurt, and when the Table of the Skull behind is not crackt, yet that before is often hurt: for the tenderness of the Bone at that age sometimes is the Cause, that the Skull may be depressed and yet now and then not hurt otherwise, oftentimes also that it is both hurt and broken, and that the Skins encompassing the Brain are broken. Lately a Boy about four years old was brought to me to be cured, who had received a violent blow upon the coronal Commisfure by the fall of a wooden Shutter from a Window, by which blow both sides of the Bone and both the Membranes were broken, and also some part of the Brain came out three several times in the process of his cure: yet the Child was cured without laying open the Wound, and without any loss of his Skull; and he was not above twenty days under cure. Now, to cure such Compressions in Childrens heads, there is no need of any more laying open the Wound, than what is made by the blow it self: And if there be no Wound made, nothing must be opened, no, not if one certainly knew that all the Bones were hurt and broken to pieces. And this will be the safest way of curing such Wounds: for whatever useth to be done contrary to this method, we have now mentioned, it hath most certain danger. The way of Cure is this, if the Contusion shew no manifest Wound, in the first place we use this Remedy; Take Oil of Roses, Chamæmil, each half an ounce, Oil of Myrtle one ounce, the White and Yelk of an Egg, with a little Bean and Barly-flower of each alike, Myrtle powdered 1 ounce: Mix them all into the form of a Plaster, and lay it on the bruised place. And the next day we use another Plaster, but scrape the first clean off. Take of the Drofs in Beehives, or of new Dreggy Wax, common Honey, each 1 ounce, Powder of Bloud-stone, Pumice-stone, each 1 ounce, of Cummin-seed, Wormwood, common Bran, each 2 drachms: Mix them upon the Fire and make a Plaster, to be laid to the depressed place, two inches broader than the place round about: The efficacy of this Plaster is so wonderfull, that within twelve days it raises the contused and compressed Bones; and, I think, for

this purpose, there is no Medicine more effectual. But if, beside the Depression and Fracture of the Bone, there be a Wound also, it must first of all be cured with the White and Yelk of an Egg stirred together, applying soft and thin Raggs, Tow and Bolsters, wherewith the Wound must be covered. And the next day we must use the Balsam often commended by us. The Wound must be gently anointed with a Feather dipt in the Balsam, whose present virtue in this kind will easily be seen: for it wonderfully concocts, mundifies, and breeds flesh: but it must be melted, yet not too much, lest it should burn the Patient, or the Medicine should lose its virtue by over-heating, (but this you must have a care of, that you take not out one bone, though it were manifest they were all broke to pieces) and you must cover the wound with dry lint, and press it not too much: Upon this you must lay the Plaster hot, that we but now described, which to the great delight and admiration of him that cures, sucks out all manner of Pus, that is bred within, and also quickly raises the compressed bones, and restores them to the same state they were in by nature: For I safely affirm I have frequently used this and the like method of cure, and do attest, that by God's blessing I have cured them of most grievous wounds.

III. On Saturday the 28. of February, 1679. a Child about four years old, the son of Mr. John Stone of Plymouth, had his head crushed between the heavy end of a Field-gate (so heavy that a Man could scarce lift it) and a small Stone, that stood above the level of the ground; this stone bore against the left Bregma somewhat above the Ear, opposite to which on the other side, about the same distance from the Ear, a pin of wood an inch square, that stood out half an inch from the gate, being forced by the weight of the gate, made a small wound, but a very great depression; it bled much, the Child cried a little, did not faint, nor convulse, only vomited two or three times. I presently laid it bare, and upon examination by my fingers, found where this little wound was, and that the Skull under it was largely depressed, I shaved it, and entering my Probe at the wound, I found the Scalp separate from the skull a great way, and a large depression of the latter. When I withdrew my Probe some of the Brain came out upon it: I entered my Probe again with the eye forward, and brought out as much as two pease; and upon dilating it several parcels of Brain appeared among the blood. I dressed it up with Dossils, dipt in *Mel rosatum*, and Spirit of Wine made warm, and covered all with a Plegent of *Linimentum Arcei*. I examined the rest of the Head, and found on the other Bregma an *Echymosis*, and under it another depression. I shaved off the hair from thence also, and with the same Razor excised a piece of the Scalp as big as a shilling, which laid bare the depression and fracture, which was such as I could not then elevate, I filled this with dossils of dry Lint, covered with a plegent of *Arceus Liniment*, over all laid a Plaster, rolled up the Head, and laid the Child (who endured all with incredible courage) to bed, his head bolstered as high as he could well lie. I gave the Father a dreadful Prognostick, and desired the assistance of Doctor Spenser. That evening I gave the Child a Clyster, which wrought twice or thrice, I gave him something Cephalick and Diaphoretick, to comfort the Brain, and prevent Coagulation, or other mischievous effect of the Contusion. The Child slept quiet, and sweat well. The next morning the Child being brisk and lively, the Doctor came, a fomentation and all things ready, he being taken up, and held on a woman's Lap, I cut off all the hair close to the head, and opened the left wound first, where we found a depression with a fracture. I could not enter an Elevatory, and therefore at that time left it as it was, and dressed it up as the day before. Opening the other wound, and taking out the dossils that I had laid in the day before, several small portions of the Brain

shewed themselves among the grumous blood, and on the dress; and a prodigious piece of skull beaten in, and wholly separated from the rest, and (which was a very ill circumstance) the outward Table being broken narrower than the innermost, made the deepest piece larger than the hole it had made, so that at that time we could not get it out. So that having cleared the part of Matter, I then onely made yesterdays incision into a Cruciate; we dressed him as before, I rolled up his head upon a Stuphe, dry wrung from the fomentation. The Clyster was repeated every day for some considerable time; his diet was Water grewel and Chicken broth, with some proper things boiled in them; his drink was sometime small bear with a tost and Nutmeg, sometime his Cordial Julep. The second night the Child slept indifferently well. We again opened the left side, and after some attempts in vain to raise the depressed Skull, we strewed Cephalick powder on it, and dressed it up with dry plegents of Lint as before. Upon opening the other, we saw again some little owzing of the Brain among the matter: we now resolved to extract the piece of Skull. After some little time I did it, by turning it so, that the narrowest part of it might come to the broadest of the Gap, when holding it fast with a Crow's bill, it easily came forth, and left a dreadful breach. The wound on the Membranes we saw plainly, with some effusion of the Brain, but it happened that it was below the edge of the found Skull, so that it became succored thereby, and (the Child being young, the Membranes more soft, and apt to consolidate) coalesced the sooner, for after four days we saw no Brain. We made our dress this time after this manner. We had a good guard of hot Stuphes, to defend from the air, and having cleansed out the Part, and smoothed the uneven edge of the Skull, we dipt a Syndon (that is a piece of fine cloth, bigger than the extracted Skull, having a thread fastened to the middle to draw it forth by) into a mixture of warm Spirit of Wine, Honey of Roses, and Balsam of Peru, and with a Probe thrust the edge of it between the Skull and Dura Mater. Upon it was strewed Cephalick Powder, covered with dry Lint. Then I snipt off the lips of the Cruciat, and, laying on a plegent, armed with *Arceus Liniment*, rowled him up. This day we ordered *Tinctura Ambra Grisea* in his Cordial six or eight drops at a time, as there appeared need. The next day, being the fourth from his hurt, we found he had had a good night. I shaved the whole head, anointed with a Cephalick balsamous liniment, and laid on a Plaster of equal parts of *Opodeldoch* and *Empl. de Betonica*, then dressed the wounds as before, and covered them with Plasters made of equal parts of *Diapalma* and *de Betonica*. The Skull scaled but slowly, as is usual in Children, therefore towards the end we used more drying Cephalick Powders than ordinary, to prevent a fungus and quicken desquamation, mixing *Guaiacum* Bark in Powder. The Dura Mater united in four or five days, the union was confirmed, so as we used digestives after five more, digestion was procured in a week after. And in about six weeks from the first dress the Skull scaled, the flesh grew up from the Dura Mater, and under the scalings of the Skull, and became level with the skin; it would sometimes be exuberant, and soft or spongy, before it could be cicatrized, a gentle touch of Roman Vitriol, and sometimes strewing prepared *Lapis Calaminaris* thereon, shrank it up, and cicatrized the left wound in seven weeks; but the right remained three months. For it was not onely difficult to make a final desiccation thereof, because of the moisture glecting from within the Cranium, but necessary to delay it, that the matter might discharge itself, as it gradually decreased. In performing this last part I used a very desiccative Sparadrap Plaster, (that is, made by dipping cloths in it when relented) which being laid double, served not onely as a desiccative and a defender from

the Brain
proved cu-
table.

from

from confluxion, by its gentle adstringency, but by its stubbornness and strength defended the part from hurt by blows, falling, and such other accidents, as Children are liable to.

IV. The depression of the Skull has been cured in several, by setting a Cupping-glass with much flame upon the Depression, after once or twice being let Blood, sometimes with incision, and much scarification, and sometimes without them. A certain man was struck with a stone on the left side of the head, and was left for dead, blood came out at his mouth and nose, he could scarce speak or open his eyes. If one pressed the depressed part of his skull a little with ones finger, he was troubled with a reaching to vomit. I ordered him to be shaved, and a large Cupping-glass to be applied with much flame, which, though it was set on the sound and solid parts, put the Patient to much pain: After the Cupping-glass was taken off, and incision made upon the part affected, and the Cupping-glass was applied again, he found great ease, and his pain was over, after which he began to speak, and knew those about him: And although I had taken seven or eight ounces of blood away by cupping, yet the next day I order him to bleed again, and so in a few days he recovered.

V. Whether should Wounds of the head be healed by sowing, or by regeneration of flesh? The best Chirurgeons neglect sowing, lest the matter kept in under the sowing corrupt the *Pericranium* and the skull, and so pain and other symptoms follow; also for fear of hurting the *Pericranium* in sowing, which in all likelihood cannot be without hurt, when the whole skin is cut. And sowing of the Flesh is not properly opposed to generation of Flesh, nor is the cure by agglutination and future the same thing; for the agglutination of the skin of the head, which requires a long time, can never be, without generation of flesh, which generation of *Pus* doth precede, wherefore it is necessary, that new flesh should grow in the room of that which turned into *Pus*. Let the Chirurgeon therefore make it his business first to close the lips of the wound by binding, applying necessary medicines, and let him leave the rest to nature.

VI. Whether when the Skull is fractured under the whole skin should this be cut? *Vidus Vidius* reports, that *Perusinus*, a famous Chirurgeon, did by long practice observe, that more of those are saved, who are cured without cutting, by lenient and drying Medicines, than of those whose skin is cut and their bone laid open; and herein he shews that there is a vast difference between a fractured skull bare, and one covered with the skin: For if the skull be uncovered, if it be left without cutting, the humour that falls upon the Membrane of the Brain, cannot be dissolved by the heat which expires; and therefore putrefying it kills a man: But when the skin is whole, the heat expires not, therefore it can digest the *Sanies*, and solidate the Bones, which we daily see in other fractures, that are covered with flesh and skin. This opinion may be allowed of, if onely a small quantity of blood be poured under the *Cranium*; if no broken bone prick the membranes; and if the broken skull compress not the Brain. But if there be store of blood, if the corruption of the parts underneath by the *Pus*, be feared, if a membrane be prickt or compressed by a broken bone, according to *Paulus*, *Celsus*, and most Chirurgeons minds, the skin must be cut, that the fracture may lie open, and other things may conveniently be done as they ought: For Nature is not able to rectifie such faults; and granting that the *Sanies* could be drawn through the skin; yet the small bones and scales, that stick within, are not easily drawn out.

VII. A certain person fell backwards from on high, and remained as if he had been quite dead. Wherefore by the Advice of *D. Pimpernelle*, and *D. le Juif*, after his head was shaved, a cataplasim of Bean-flower was applied all over it: And because the case required haste, (for the Patient had lost his speech) that the Cataplasim might sooner drie, they got hot cloths

applied to the cataplasim for the space of six hours: when it was dried and taken off, the figure of the latent fissures of the skull was found plainly delineated on it: for the cataplasim will not grow dry in the places of fissures or fractures: And a great fissure appeared in the middle of the *Crotaphitus* Muscle.

VIII. A little Girl fell down a pair of Stairs, and knockt the hind part of her head against a stone step, so that it made a great depression of the bone with contusion onely: And when her Parents would not yield to cutting, nor the necessary operations, but would onely have Medicines applied proper for the inflammation and contusion; she was beyond expectation cured by Nature, yet there remained a notable depression of the bone. We need not therefore be much afraid for Children bruised after this manner, by reason of the softness of their skull.

IX. *Aquapendent Chirurg.* l. 2. c. 8. shews when Trepanning the skull may be used. Trepanning (saith he) may be used in these two Cases. 1. If a descent of the matter be feared. 2. If there be not a sufficient outlet for the matter. On the contrary, if the Fissure be open, or the fracture reach not through the whole bone, and if there be no contusion, so that there is no fear of *Sanies* contained within, the skull must not be opened, nor the *dura meninx* exposed to the air to no purpose. We must observe that if the Fissure or seat of the Instrument descend to the middle part of the skull, scraping will not be sufficient, but we must proceed to trepanning, although no other symptoms appear; upon this account, because the purulent matter running from the lips of the wound to the middle part of the skull, doth also by its vessels penetrate to the membrane also, betwixt which and the skull it being gathered, causeth death: I have observed this in several, who for this reason were trepanned, that they all recovered.

X. We put the Trepan to the broken or contused skull, that partly we may raise the depressed bone, partly that matter or blood stagnating in the *dura meninx*, may, when the hole is made, be evacuated: Yet *Peter Marchetti* saw matter evacuated without the Trepan. ¶ A young man falling from a window contused his skull, which caused Convulsions and other symptoms: The skin, after incision made, sweated out *Pus* by the Pores of the Skull, as sweat useth to come through the skin. ¶ A Boy having contused his Skull, voided blood at his Nose, Mouth and Ears; his Mother refused the Trepan: The Boy being neglected thirty days, an abscess and inflammation arising in his head, *Pus* ran out at his Nose in great plenty. *Marchetti* being called at last, performed the opening of his Skull with a Trepan excellently well indeed; but because thirty days had past, the Boy at length died: for according to *Hippocrates*, in wounds of the Skull of this nature we must not tarry four days. The nature of our Soil and Clime is otherwise, and doth not exactly agree with the seasons of *Hippocrates* his Air, nor will admit of such generous operations: Our colder air retards the quickness of the inflammation, and stronger bodies, if a little time be allowed them, do with Nature's assistance raise the bones of the Skull of themselves: For I have seen profound contusions of the Skull cured in our City without a Trepan, onely by applying *Emplastrum magneticum* & *de Betonica*. ¶ A Walker in his sleep, at his full growth, and of no small bulk of body, in the Summer 1673. fell from the second story upon a flint pavement, he fell not with his whole weight upon his head, but the trunk of his body first bore the chiefest force of the fall, otherwise he had hardly escaped the abolition of all his animal actions, and immediate death; yet in the mean time he had grievously knockt his head, for his Skull was cleft, not without effusion of blood within it, which is the perpetual concomitant of Fissures: The *Italians*, and other hotter Countries, would immediately have taken the Trepan in this case; and so would the excellent *Mr. Burgomaster* have done, but that the Patient and by-standers were absolutely

Idem.

absolutely against a Remedy not usual in these parts; and which to most men carries terrour in its very name, and so hindered his Intention. He endeavoured therefore to stop any farther profusion of blood within the Skull, and to consume what was already extravasated: He diminished the blood by repeated letting of it: He rubbed all his back with discutient Oil: He wrapped his Body in Lamb-skins just slain: He applied Cephalick bags boiled in Wine to his head: He denied him Wine: He gave him a decoction of Harts-horn to drink: He restrained the motion of the blood, disturbed by the fall and grumous blood, that was beginning to be inflamed here and there all over the body, and so made very impetuous: By taking away some quantity of blood he made the veins as it were hungry, that they might suck back what was effused more greedily; to which purpose also pertained his thin and cooling diet: By giving a Traumatick tincture, and outwardly applying bags stuffed with Cephalick herbs, and boiled in Wine, he so disposed the extravasated blood (which would have become grumous, and might have caused much damage by its putrefaction) that it could enter either the blood-vessels, or the pores of the Glands. And he did all this not without good success, nor without a precedent; for the same course, without trepanning the Skull, has often succeeded as well as one could wish. I cannot believe, the extravasated blood passed into thin air, and vanished like a vapour; for the thickness of the Skull, and denseness of the *Dura meninx*, would hinder that; which is the reason, that it pertinaciously detains even mere water in the Dropick of the head, so that the wit of Man cannot get it out without opening, and that is very dangerous. We see daily, how Swellings, half as big as a Hens egg, arising in the foreheads of little children from violent falls, and growing black and blew with suffused blood, do presently sink by applying cold Iron; or if this repercussion at first be neglected, by applying a piece of warm flesh, how in a few hours space they vanish, without any manifest evacuation.

Wepferus, de
Apoplexia, p.
340.

XI. Although Instruments are often applied to the Skull in fractures or fissures; yet sometimes they may properly be applied to it whole, especially if there be fear that any veins are broken: For by this means not onely the effused blood is got out; but moreover inflammation, putrefaction, delirium, a fever, and other Symptoms are prevented.

Tulpius, lib.
2. obs. 2.

XII. One had got a wound in the fore-part of his head, which the Chirurgion, by reason there were no Symptoms, cured in fourteen days time, according to the first intention (Anno 1629. in the month September.) Thus cured, he came to *Ulm*, Anno 1639. in March, and complained of a great pain all over his head, of a *Vertigo*, dimness of sight, and a Palsie in his right Arm. Now, by reason of the great suspicion I had of a fissure in his Skull, twenty weeks after he had received the hurt, I made a triangular Incision into the skin and *Pericranium*, upon the *Sinciput*, and I sufficiently dilated the wound, separating the *Pericranium* from the bone, and applying Lint dipt in a Stegnotick. On the 13th day of March, when the blood was stopt, I found the Skull cleft, and I bored it twice with a trepan, upon the edge of narrowest part of the fissure, and took away the interstice between both holes with a turning Saw. The matter being evacuated, that fell by the fissure upon the *dura mater* of the brain, the said Symptoms ceased, and the Patient in a months time recovered.

Scultetus,
Armann, obs.
23.

XIII. A Man of Threescore had a blow on the left *bregma*, with fracture and depression of the Skull: I was called to him on the 10th day in the evening: I found him in a Fever, delirious, and speechless: having given the prognostick, I undertook the cure: I made a Cruciate and laid open the Skull; the

Fab. Hildanus, cent. 4.
obs. 4.

next day having taken out a few bones, that were separated from the first table, I trepanned him. And so he that was given up for lost, happily escaped.

XIV. One was wounded on the right side of his head, the wound reached all over the *Cranium*, and Membranes themselves, so that a piece of the *Lamina vitrea*, where the wound did almost end, did so prick the Membranes and Brain, that besides other Symptoms, there was this peculiar, a Palsie in the opposite Arm, and the Tongue. Beside common Medicines, the next day I trepanned the Skull in the midst of the wound, but with no relief; and therefore I resolved to try a new trepanning, but in vain: Then I tried two more, being fully assured that the Membranes were hurt, and the brain vellated by some piece of bone, which I found true: for in the very operation I hit my Trepan against a piece of bone, which I took hold of, and drew out with a pair of plyers, to which a portion of the *Marchetti, Membrana pia*, and the brain, were annex: Upon which, within half an hour, he recovered his Speech, and the use of his Arm, and lived long in good health. *obs. 5.*

XV. We must observe, that the Trepan and the Elevatory must never be applied to a bone that is totally broken off, lest by compression of it the Membranes under it be hurt. Therefore they may be applied to the firm bone; but as near as may be to the fracture, that less of the Skull may be taken out, lest the brain, deprived of its bony cover, get some hurt. Nor may you follow fractures, or fissures, if they reach any thing far, to their very end; you must be content to procure a passage for the *Sanies*, and with the taking out of so much bone as pricks the Membranes; for when a *Callus* is bred and grown under, Nature will make up the fractures of the Skull, as she uses to make up those of other bones: For which purpose, she, by a singular providence, hath filled the two tables of the Skull with a certain alimentary and sanguineous matter, that herewith, as with Marrow, she might repair the hurts of this bone. The truth of this appeared lately in Mr. *Grolo's* Servant, who suffered a grievous fracture upon his coronal bone by the kick of a Mule. When I understood this, I made a triangular section, that so I might apply the Trepan: The day after I had bored the bone, I thought to take it out; but as I was trying to get it out, after I had separated it with the Trepan, I found, by the looseness of the bone yielding under my hand, an enormous production of the fracture; for it reached from the middle of the forehead to the outer corner of the eye: Therefore laying aside all thoughts and endeavours of taking out the bone, I thought it sufficient for my Patient, if I raised the depressed bone a little higher, for then it would not be troublesome by compressing the thick *Meninx*, and there would be sufficient passage for the matter by the division, which the Saw made. Upon this, at length he recovered, onely he lost the fight of his eye next the fracture. *Up-Parvus, l. 9. c. 6.*

XVI. *Carpus*, in his Chapter of the signs when a bone pricks the Membranes and Brain, saith thus; "That the Skull is nourished by the veins of the *dura mater*. I saw by experience in a Boy twelve years old, that was kicked by a Mule, and had as much of his Skull broke as a large Wafer, pressed in, and every way separated, the thickness of a Knife. When I saw the bone depressed, I was willing to have totally raised it with apt Instruments; but in raising it, I saw one notable vein broke, that bled much, from which I knew the danger was great, and I let the bone alone, because it stopt the blood, thinking to remove it in time; and in curing, I see the bone always of a good colour, and there were no bad signs, and so I proceeded in the cure afterwards, and I saw the bone close up on the edges, and I let the bone alone, and so he was perfectly cured; and I have seen others

Parvus, l. 9.
c. 7.

"others both before and after which I will not speak of. ¶ When these veins, by which the *Cranium* is nourished, are torn, it falls out, that they are retracted inwards, and the blood runs from them, which putrefying, and no manifest hurt in the bone being seen at first; but at length cruel Symptoms arising, the Patient dies. Besides, it may so happen, that though no veins be broke; yet by the violent blow, and concussion, much blood may be drawn into the veins, that lie under the Skull, and the blood being forced into, and retained in a narrow room, and not duly purged, distillation being prohibited by its standing, and it conceiving an extraneous heat, Inflammation ariseth, which is usually attended with death; though the wound appear very slight to the beholders eye.

XVII. It is the common opinion, if both tables of the Skull be broke, that the Skull must be opened, that there may be a passage for the *Sanies*; but others think application of Medicines more proper than the Instrument. 1. Because by Medicines nothing more is destroyed, as is by manual operation; but what is broken, is presently restored. 2. Inflammation and other things often follow opening of the Skull. 3. Inflammation of the Membranes of the brain is cured onely by Medicines, and not by manual operation. 4. There are Medicines that draw out Arrows, Thorns, &c. Why not *Sanies*? 5. Many have been cured onely by Medicines. I grant this to be true, if it certainly appear, that the Skull is neither broken nor deprest, and that there is nothing which hurts the brain, and but a small quantity of *Sanies*; which the Symptoms do shew: But if there be a great quantity of *Sanies*, or if the brain or membranes be hurt by the Skull, opening must by no means be omitted; and it is better to prevent those Symptoms, which if they do follow, will render the operation more difficult and dangerous.

XVIII. We must take notice, that if it chance by a violent blow and great wound, that a portion of the bone should be so cut, as to be wholly severed from the rest of the Skull, and hang onely pendulous by the *Pericranium* and Muscous skin; it must not be pulled from the *Pericranium*, nor be cast away as useless, but it must be restored to its place and posture, that when the *Callus* is bred, it may, by the power of Nature, be glutinated with a kind of bony cicatrice, as is noted by *Celsus*. I found the truth of this thing not long since in Captain *Hydon*. The middle portion of his coronal bone, three inches long, and as many broad, was so cut off with a strong Sword, that then it had no coherence with the neighbouring Skull, but scarce sticking to the *Pericranium* and Muscous Skin, it lay turned over upon his face, and gave us a prospect of the *crassa meninx*: Therefore I was going to pull it from the skin and cast it away, unless *Hippocrates* his Precept had come in my mind, which bids us have a care of disarming the brain of its cover, and leaving it naked: Wherefore first of all I wiped off the blood, that had fallen upon the thick *meninx*, whose motion I could observe by my eye; then I restored the piece of the bone turned out to its place, and tacked it to the upper part with three stitches with a Needle; and that there might be a passage left open for the rest of the *Sanies*, I filled the edges of the wound with Liniments: by this art it came to pass, that, though he had many large wounds in other parts of his body, yet through God's Mercy he recovered. Which may be a Precedent to us, that nothing, neither of the *Cranium*, nor the *Pericranium*, no, nor of the Muscous Skin must be cast away, except necessity require it, and much less that the Brain should be left naked of its cover.

XIX. Let not the Chirurgion that trepanns the Skull imitate *Glandorp*, who holds on boring, till the piece that is cut out of the Skull stick to the Trepan; but when the piece of bone almost cut out

begins to give way, having put in a weak elevator, let him pull it out with a pair of plecters.

XX. If the Skull being laid bare, be either altered by the ambient air, or grow black, then it must be scraped away, either to the change of colour, or till it bleed, that is, when good *pus* appears, and the wound cleanseth: If the Chirurgion observe this time, after once scraping, and sprinkling with *Cephallick Powders*, and treating the bone with dry *Lime*, he will find it the next day covered with flesh. For we must not listen to *Jac. Berengarius*, who, *l. de fract. Cranii*, c. 42. orders the bone to be rasped superficially every day; because the derasion made at the foresaid time is sufficient: but if it be used before that time, it must be often repeated, not without danger to the Patient, because by this means the rasp will at length come to the *Diplois* by degrees; They that are too timorous, leave the desquamation of the altered bone to Nature's management, but they protract the cure.

XXI. If the fissure of the Skull be deep and broad enough, to let the matter purge freely from it, neither trepanning the Skull, nor violent dilatation of the wound with a Knife is proper: Therefore *Chalmeteus*, *l. 2. Enthir.* c. 14. doth rightly judge they deserve censure, who not onely in a little fissure of the brain (although it be not deep) but also in a large one, that is open enough, do boldly use the trepan: by which no small error of theirs the cure is protracted a very long time, to the Patient's great damage, and the Physicians discredit.

XXII. I think we should have the same opinion of all those that dilate every wound of the head; whereas section should onely be used, when we know not but that the Skull should be trepanned, or rasped. What should be done, when the wound of the head with a large fissure, refuses the rasp and the trepan, *Scultetus*, *parag. 6.* doth shew; confirming it by the example of one, whose left side of his *sinuiput* had so large a fracture in it, that he could easily have put his fore-finger into it; to which fracture a *Phlegmone* of the *Dura mater* was joined, which nevertheless, universals premised, vanished in three days, by the diligent use of oil of *Roses* applied warm with *Silk*, and *Hippocrates* his Cataplasma.

XXIII. They proceed without reason, who, in all manner of wounds in the head, make a cruciform section. If the wound be given on the right or left side of the *Sinuiput*, the Chirurgion must dilate it into a Triangle, that, if it may be necessary, he may safely use the Trepan: He makes his section triangular, because the coronal suture, and the right temporal muscle forbid it to be cruciform. He begins the section from the forehead, lest he should cut cross the Temporal muscles, that he should at

XXIV. *Marchetti observat.* 15. denies that the temporal muscle can be cut without danger, as often as the wound or contusion is with the fracture of the bone, for that most who are so wounded do die: yea, he affirms, that a fissure onely of the bone, lying under the temporal muscle, has often caused death. Yet examples are not wanting of its being cut without such danger: *Cattierus*, *observ.* 9. tells, how a young Woman had a contusion without a wound, upon that muscle, against the corner of a Table: upon which she became speechless, with other grievous Symptoms: That the Chirurgion *le Large* did reckon the contusion of this muscle, and the dilaceration of its fibres, and the compression of the *Pericranium*, that involves this muscle, were the cause of these things: Yet because he doubted whether there were a fracture of the bone under it, he made a small incision, according to the dust of the fibres, and a little while after her Symptoms ceased, some sharp *Sanies* ouzing out, which vellicated the part of a most exquisite sense. ¶ And *Borellus*, *cent. 2. obs.* 20. relates, that Count *Breve* had

Scultetus.

Scultetus, Tab. 29. par. 3.

Idem. Tab. 29. par. 7.

Scult. Tab. 27.

Marc. Donatus, l. 5. c. 4. hist. mir.

Sennertus.

Parvus, l. 9. c. 7.

got a large fissure under the middle of that muscle by a fall from on high, and that Mr. Le Juif, contrary to the doctrine of Authours, made a section in the muscle, without any regard to the fibres at all, which he affirmed he had done several times in others; he saith, that when the section was made, the Arteries spurted out the blood, which was stoppt with Astrigent powders and lint; when the Skull was laid bare, there stuck out a pretty large scale of a bone, which the said Le Juif forced violently out with his Spatula, saying, there was no need of any other trepan, when that would doe as well, after which the blood gushed violently out, which when it was stoppt, the brain was anointed; he presently recovered his speech, and had his health well after. ¶ One Smith, sometime a Tanner in Chester, was afterwards a Captain of a Company of Dragoons, which he pickt up in haste, to disturb us in our Retreat from the battel of Worcester. He was wounded by some of our Soldiers transverse the right Temporal Muscle, and was bleeding almost to death, when I was brought up to his Quarters. I sticht his wound, taking the Artery up with the Lips, and, for want of other remedies, dress't it with a little Wheat flower, and the White of an Egg, applying over it a compress prest out of Vinegar, with convenient Bandage. The third day after I took off the Dressings, and found the lips near agglutinated. I being then better provided by an Apothecary from Warrington, sprinkled the lips of the wound with *pulv. thuris & sang. draconis*, and applied a Pledgit spread with *Liniment. Arcei*, and over it *empl. diacalcit.* The second day after I cut the stitches, and applied Epuloticks; and afterward by a dressing or two more cured him: I am sure he was well of his wound, before he had recruited his spirits he lost with his blood.

Wileman's
Chirurg. l. 5.
c. 9.

XXV. It is very doubtfull, when driers, and when moistners should be applied to the *dura meninx*, when it is laid open. Truly since Moistners and Driers are diametrically contrary one to another, it must be of some moment, which of them to use. Some use spirit of Wine, either alone, or with the addition of Turpentine, and such like things, relying on these reasons; that all Ulcers require drying; that oils are hurtfull to the nerves, and all nervous parts, as the *meninx* is; that cold things are not less hurtfull; such as oil of Roses, which is commonly used. Some use Moistners, some oil of Roses, others Pigeons blood dropt in, because through similitude of Temper they foster the native heat, keep off defluxions, and assuage pain, the cause of Defluxions. Now, to determine aright, we must examine the nature of the wound, the body and the clime: If the membrane be not hurt, if it be free of inflammation and pain, and if it look white, dry Cephalicks must be used; in such a case *mel rosatum*, with 4 or 5 drops of *Aqua vite*, may successfully be applied: But if pain and inflammation be feared, and the membrane be not free from hurt, *Oleum rosaceum omphacinum* is most proper, because of its astrigent virtue and moderate cooling, whereby inflammation is prevented, and suppuration quickly promoted. Upon account of the Clime, *Meges Sidonius*, in the hard and robust heads of the Persians, onely used *Isis* (a Plaster so called) the *Italians* dare not use it without twice as much oil of Roses added to it. In respect of the constitution of Bodies, oil of Roses alone is sufficient for the more tender and moist; in drier bodies, such as Seamen, Plow men, the elder sort especially, and such as have curled hair, a little Turpentine, or oil of *St. Johns-wort* may be added. So in Summer, oil of Roses is more proper, in Winter Turpentine. J. Griffonius, as Fabricius Hildanus relates it, made such reckoning of the distinction of bodies, that he made no scruple to use the syrup of *Unguentum Egyptiacum*, that is, the thinnest part, that swims at top, not with lint indeed dipt in it, for so it might run to the sound parts, and breed grievous Symptoms; but he gently touched the superficies of

it with a Painter's Pencil dipt in it. Now, he made use of it in a robust *Swisse*, the Membranes of whose brain were infected with manifest putrefaction; or corruption, which was presently stoppt by help of this Syrup. And the same Fabricius advises us to use such remedies, but sparingly, and to desist immediately, when the violence of the disease is repressed: And he grievously rebukes some Barber-Chirurgeons for using *Oxymel* in wounds of the head, and in the membranes made bare: for by the sharpness of the Vinegar many grievous Symptoms are caused, great pain, then presently inflammation of the membranes, a fever, convulsion, &c.

XXVI. It is doubted whether the *dura meninx* may be cut, to make a passage for the *Sanies* that is gathered upon the *Pia*, or the brain: For when it is prickt, there is great danger of convulsion and therefore of death; which I think to be none, if the Skull be pierced in two places, and the hole so laid open, that a long section may be made upon the hard membrane; and indeed, for this reason, because great wounds of the head, which not onely cut the membranes, but the brain it self, are cured. When therefore it doth certainly appear, that matter is gathered between the two membranes, then we may safely proceed to this operation, however not void of danger; because otherwise, if no remedy were used, death would certainly follow, and according to *Celsus*, it is better to try a doubtful Remedy than none. Marchetti, obs. 14.

XXVII. I would give all Chirurgeons this Caution, in perforation to elevate the *Cranium*, that if possible, they do not pass the *Diplois*: because the perforation of the second table, which is not so thick, but very brittle, leaves some roughness upon the Skull, which afterwards, by pricking the brain, doth cause Pain and other Symptoms. Hildan. cens. 2. obs. 5.

XXVIII. Sometimes Physicians do admire, that the cure of some wounds in the head should be too long protracted: This is often observed to proceed from some little piece of bone, which, unless it be removed, the cure will never succeed as you desire; which I have several times observed, and which *Carpensis* testifies in these words. Because bones are for the most part brittle and glassy, and when a notable fissure is made in the Skull, that reaches inwards, some pieces of the bone fall down upon the pannicle, and they are notable because greater, i. e. with a greater fracture in the second table, i. e. in the inner, than in the upper, and they prick or press the Pannicles. And the Physician in such cases should saw the Skull on the edge, enlarge the fissure and take out the bone, because such a disposition is not otherwise cured. And I had this notable case in a certain man, who had stood for a whole year with a great piece of bone under his Skull, and the wound was remarkably long, and healed all up, but that the end of the wound could never heal or close up; and there were two little orifices, out of which the *Sanies* oozed at least for six months. When I came I laid open the wound, and dilated it both in length and breadth, and with a Saw I removed the edge of the Skull, and I found a long and thick piece upon the Pannicle, which I took out, then I cleaned the Pannicle, and in a short time I cured him, and he lives yet in good condition. Marc. Donatus, hist. mir. l. 5. c. 4.

XXIX. Charles, the Son of Philip King of Spain, falling down a pair of stairs, got a grievous wound in his head: Chirurgeons were called, who bind up the wound, and being intent upon healing it up, neglect the discharging of the *Sanies*: Therefore his whole head swelled like a Puff ball, and the youth lay like one in an Apoplexy. Then King Philip brought *Vesalius* to him, who affirming, that in this desperate case, his onely hope lay in opening the *Pericranium*; and having got leave of Philip, he laid the Swelling open cross-ways, and by degrees evacuated most fetid pus: Then the youth came to himself again, as if he had awaked out of a deep sleep. Schenckius.

XXX. When I practised at the Hospital in Florence, I found it most certainly true in the event, that of 40 persons, whom we have had wounded in a year,

year, scarce five escaped: For there it is very frequent for the slightest wound in the head to prove mortal; and they reckon it a certain sign of death if the wounded Man fall to the ground, and begin to vomit; because this shews that the *meninges* and nerves do also suffer. I have sometimes thought, that perhaps this might happen from too much, and almost superstitious diligence in the cure, while they immediately sequester the wounded Man from all company, let him bloud, prepare the humours, and purge him: And their meaning is good, yet in the mean time they almost starve him, giving him only a little *Panada*. They labour mightily to suppurate the wound, and keep him from the Light, which means alone are sufficient to weaken Nature. But they ascribe all to the subtilty of the Air, which indeed, as it cannot be denied, so whether these other things be so proper, I leave for any man to judge. As many things are done negligently, so now and then some are done with care without necessity.

J. V. Rumerus, obs. 76.

XXXI. I think it not fit to conceal an Error very common among some unskilfull Chirurgeons, who, in winter time, that they may keep off the hurtfull cold of the ambient air, do not onely keep the Chamber exceeding hot, but wrap their Patients heads in many clothes and swatches: Yea, I have seen some that have held heated Tiles over their heads, while they were dressing; Whence we find very slight wounds of the head sometimes prove mortal: It's true, cold must be avoided, but it must be with moderation, as *Hippocrates*, *l. de med. offic.* saith. But unless the clothes that are used be thin and smooth, heat and inflammation in the part will be raised: And in his Book of *Fractures*, when he fears inflammation he avoids a multitude of swatches and clothes.

M. Donatus, obs. mir. l. 5. c. 4.

XXXII. A Soldier received two blows one upon another behind in his head, and was knocked down: There was no bloud, no fissure of the Skull, nor any evident depression: After nine weeks he could speak and walk well, and when he found no pain from the contusion, and was resolved to be gone, he went (to all Mens thinking) to bed well, but he died in his sleep. When his head was opened, there was not the least fissure nor appearance of any depression; but just under the blow, the substance of the brain, for about an inch, was putrefied extremely, and the putrefaction reached to the ventricles of the brain. From this observation let Chirurgeons take notice, that they never judge any blow in the head little, though they find the parts containing the brain unhurt: Let them never promise an undoubted cure in them. And above all, let them allow no errors in Diet; but rather let them treat their Patients with wary Art, and a prudent Diffidence, that they may approve themselves their Craft's Masters.

Sculetus Arman. Chirurg. obs. 8.

XXXIII. A Woman's head was grievously bruised with a Plank, and the skin and flesh were laid open by a Chirurgeon to the bone, and the *Pericranium* was taken off, with some substance of the bone: The wound was left long open, and there were no signs of the bones being broke: And when the bone at length scaled, some portion of the bone that was separated, was taken off violently by the Chirurgeon, presently the bloud was seen to ouze out, then an acute fever, and at length she died. ¶ When either by reason of a contusion, or the injury of the air, the bone is about to scale, it is enough, if without any manual operation, some Cephalick Powder be srewed on it: And as the flesh grows underneath, the dry and dead skale will be thrust out of the wound, and part from the rest of the bone which is alive and hath moisture in it. As it happened to N. whose head was bruised by a fall, after the 40th day a large and notable scale parted from the rest of the bone: This the Chirurgeon got out of the wound with small trouble; now, he dressed the Man every day, by my advice, with those Me-

Cattierus, obs. 8.

dicines the Ancients have compounded For fractures of the Skull: And the Man was perfectly cured.

Vidus Junius, lib. 6. c. 2. de car. memb.

XXXIV. In simple wounds of the head, whereby the Skull is not hurt, how much harm the common custome of the place in opening, or how much good the letting them alone does, in reference to cure; beside many other examples this one doth set out, which was given by J. G. who was struck obliquely, but with no great force, with one tooth of a Prong upon the right side of his head, upon the Bone called *Laterale*: An unskilfull Chirurgeon, by laying open the wound, made it much the worse; he made a Cruciate three inches every way, and laid the Skull sufficiently open, as he thought fit; then he used digesters and oil for several days; whence it came to pass, that not onely so much of the Skull as was laid open, but a great deal more every way was corrupted, and must of necessity be taken out: And now the Man, through God's Mercy and my means, is well.

Arcæus de curand. vuln. lib. 2.

XXXV. The Trepan must be applied the second or at farthest the third day after the hurt (especially when any sharp bone pricks the *dura mater*) while strength is good: for after three days, and as long as there is an inflammation actually, or one imminent, all use of the trepan is dangerous. Nor are they to be heeded, who, according to *Paulus*, tarry in Summer till the seventh day, in Winter till the fourteenth, because then it is too late to trepan, when strength is gone, and it may be suspected, that the membranes of the Brain are already infected with the matter falling upon them.

Sculetus, Tab. 29. Sect. 6.

XXXVI. When the Chirurgeon is to search how far a fissure reacheth, let him (according to J. C. *Arantius* his counsel) rather make use of Printers, than writing Ink, because of the sharpness of the Vitriol.

Id. Tab. 29. par. 4.

XXXVII. In some places the Skull is simple, thin and pellucid, without any Pith; Wherefore some Chirurgeons are mistaken, who think they may in taking away the first Table, cut and bore so long till the bloud come.

T. Barthol. Anat. vesic. bel. 4. c. 3.

Medicines especially made use of by eminent Physicians.

1. Take of the juice of Burnet 4 ounces, Man's Skull calcined 1 ounce, Mucilage made of Man's Skin (especially of the head) 2 ounces, Man's Marrow 1 ounce and an half, White Wax 4 ounces. Mix them, make a Plaster. Apply it, and you will admire the effect. Or (which is much the same) let some Beef washed be put into a Glass, well stopp'd: Boil it in *Balneo vaporoso*, and a reddish yellow liquour will be extracted, put as much Man's Grease to this. Mix it, and keep it; it is a most excellent Balsam for wounds in the head. ¶ Take of juice of Sanicle 4 ounces, Frankincense, Mastick, each half an ounce, Man's Grease 2 ounces, prepared Magnet, Sulphur made of Glass of Antimony, *Saccharum Saturni*, each 1 ounce, Wax, Resin, each 4 ounces. Make a Plaster.

Joh. Agri-cola de vuln. capit.

2. This Liniment invented by me is of singular use, of which at all Assays it never repented me: It is made thus; Take of clear Turpentine, and *Emplastr. de Gum. Elemi.* each 1 ounce and half, Wether Sewer 2 ounces, old Hog's Lard 1 ounce, melt them on the fire. Make a Liniment, with which being melted, the wound must be lightly touched with a Feather.

Arcæus de vuln. cap. l. 1. c. 6.

3. The best and most deterfive Medicine in wounds of the head, is this; Honey of Roses mixt with *Aqua vite* and Turpentine, or the Oil thereof, with some *Sarcocolla*, and *Alkermes* in powder.

Chalmeaus.

4. Ointment of Woodbine is a most excellent Sarcotick Medicine, especially in wounds of the head, when we would breed flesh in the Membranes of the brain: It is made thus; Take of Wood-

M bine

Fallopianus, de
ant. cap. 6.
20.

bine flowers powdered, Betony leaves powdered each 8 ounces, new Wax 10 ounces, Gum *Elemi* 4 ounces, black Wine strong and sweet 12 pound. Mix them together, and boil them to the Consumption of the Wine, strain it into cold water and keep it.

5. *Hofmannus* commends all Medicines made of Mistletoe of Hazle, for wounds in the head; and Chervil also, especially Broth made with it.

Rulandus
I. c. 1. 4.

6. I healed a bloody and deep wound in the head by a fall in four days, by anointing it with oil of Sulphur, and applying *Empl. Diasulphur.* to it. All dangerous and even incurable wounds are cured with these two things most certainly.

V. rignans
secret.

7. Betony bruised and applied doth heal with wonderfull celerity, and its virtue is so great, that it draws out broken bones.

8. Take Turpentine, pure Resin, new Wax, each 2 ounces, oil of Roses 8 ounces, Mastic, Frankincense, each 1 ounce, Gum *Elemi* 2 ounces, Woodbine, Betony, each 3 ounces, the best Wine 10 pounds. Beat the Woodbine and Betony to powder, steep them 24 hours in the Wine, then add all the rest but the Gums, boil them till half the Wine be consumed, and till they begin to look green. Strain it, and let it stiffen, then pour on the Wine, and boil all till the Wine be consumed that was left; strain it again, and add the rest of the Powders, and boil it on a gentle fire, always keeping it stirring; then take it from the fire, and keep stirring till it be cold. Keep it. It is a most excellent remedy to cure all Wounds, especially those of the head.

Vigierus, op.
chir. l. 2. c.
16.

Weikardus,
Thesaur.
I. pharm. c. 1.

9. Take some fine Linen cloth, rub it well, light it at a Candle, and when it is almost burnt with the flame, extinguish it in oil of *St. John's-wort*, and mix them well with a *Spatula*, and let this mixture be applied moderately warm to the wound in stead of a Plaster; it heals wonderfully, and stops blood, especially if a little Alume be put in it.

not at the beginning of the Plague or Pestilential Fever always, but oftentimes four days or more after, when the strength is already spent in contending with the disease.

Sennertus.

II. But we must have a care, when we let blood, that we draw it not to a noble part, nor by a noble part, lest it be affected with its Malignity: Therefore such a vein should be opened, as may rather draw to the part affected, than retract from it: If the Carbuncle be above, you must bleed above; If it be below, then bleed below.

Idem.

III. Because bad humours can scarce be evacuated by blood-letting, some think it necessary to purge, that so they may be evacuated, lest the innate heat be suffocated and extinguished by them, to the end that Nature may afterwards better manage expulsion, and the part it self may not be corrupted by the multitude of humours. But it is greatly to be feared, lest the humour, that Nature endeavours to throw out, should be drawn inwards by the Purge: And this is most to be feared in a Pestilential one; in one not malignant it seems more safe: But when there is a Fever with it, and that acute, the crudity of the matter often hinders Purging; and there is scarce any Carbuncle, wherein there is not something of malignity: And therefore the malignant matter is with more safety thrown to the out-parts by Alexipharmacks, than drawn inwards by Purging.

Idem.
Chalmersus,
Enchir.

IV. Two days after bleeding you may give a Purge: but let it be weak, lest it cause an immoderate motion in the Humours, which I have found ever hurtfull, and sometimes mortal.

V. After letting blood, the part affected must be presently scarified, and with indifferent deep gashes, that the corrupt and poisonous blood may be got out, which otherwise would corrupt all near it: You may also apply a Cupping-glass, or Leeches to the place, when it is scarified. Yet if the Humour flows thither with great violence, drawers cannot safely be used, lest when the matter flows yet more abundantly, the pain grow more violent, whereupon want of sleep, increase of the Fever, &c. Sennertus. do follow.

VI. N. in the time of the Plague was tormented with a Pestilential Carbuncle in his *Anus*, it was large and black, and when it struck in and disappeared, it threatened certain death to the Patient: for retraction, I held first one red hot Iron, and then another to his *Anus* (yet so, as not to irritate the *Anus* by touching it with the Irons, but that it might feel the heat of them as hot as the Patient could well endure) till the Carbuncle was drawn back to its old place: When it was returned, I seared it with an Iron, and laid on a Cataplasim, which in two days removed the Eschar. Take of common Salt half a Scruple, Pepper 1 drachm, fat Figs No. iij, leaves of green Rue 1 handfull, old Sower Leaven 1 ounce, Mix them all very well in a Marble Mortar. Renew it twice a day. (*Adrian Spigelius* his predecessors had this for a secret.) The Eschar of the retracted Carbuncle being removed, I applied to the Sore *Unguentum Citrinum* with lint, which hath a power to digest, attract, breed flesh, and resist Poison. This is *Unguentum Citrinum*. Take of Tobacco juice 6 ounces, new yellow Wax 4 ounces, Pine Resin 3 drachms, Turpentine 2 ounces, Oil of Myrtle what is sufficient; make a soft Unguent. So *Aquapendent* describes it, *Pentat. Chirurg. cap. 20.*

Sculletus,
Armen.
Chirurg. l. 1. c. 28.

VII. If there be any that cannot bear Scarification, or if the Carbuncle will not yield to Medicines, and if corruption, blackness, &c. do seem to increase, we must presently have recourse to cauteries, seeing there is danger in the least delay: And potential ones are not so safe, seeing the Scab made by them falls off more slowly, and so the exhalation of the corrupt and malignant humour is hindred. An actual one is reckoned safer, because the heat and dryness of the fire doth strongly resist putrefaction,

Carbunculus, or, A Carbuncle.

Medicines.

I. **A**lthough the hot blood, from which the Carbuncle ariseth, should be taken away by blood letting; yet it must not inconsiderately be used in all; but if at all, especially in that which is not Pestilential; of which *Galen*, 14. method. m. c. 10. and other Authours must be understood to speak, when they talk of letting of blood to fainting. But in a Pestilential Carbuncle we must not easily do any thing that may waste strength, which we should have the greatest care of in the Plague and Pestilential Fevers: among all which things letting of blood to fainting is the chief; because it evacuates the humour most amicable to nature, and the best treasure of life, with the Spirits: Nay, sometimes when a Pestilential Carbuncle is just breaking out, we cannot safely let blood: because the Carbuncle riseth

putrefaction, preserve the sound parts from putrefaction, and draw from far: Nor need it be thought so grievous a Remedy, when the Patient can scarce feel it, because the Flesh is dead, and we give over Burning, when there is a sense of pain all over it. Yet it hath this Inconvenience in it, that it leaves a Scab, which hinders the malignant and venomous matter from exhaling. If therefore any one will use it, let him have a care that the Scab hinder not the exhalation of the malignant humour; therefore it must be removed within twenty four hours, nor by moistners and suppuraters, in which there is danger of Putrefaction; but with things that deterge, dry, resist Putrefaction, and break off the Fibres, whereby the Scab doth stick. *Fabricius Hildanus* uses this Ointment; Take of bitter Vetch flour, root of round Birthwort, of Florentine Orrice, Swallow wort, each half an ounce, Treacle two drachms; with a sufficient quantity of Honey of Roses; Make an Unguent. *Augenius* commends this; Take of Mily, or Vitriol, 2 drachms, of the best Honey half an ounce, Hogs-lard 2 drachms: Mix them. I had rather use such Medicines to bring a Scab, which usually comes upon a Carbuncle, than use Cauterics; because there is not only simple Putrefaction, but a malignant Humour.

Sennertus.

VIII. The Cure of a pestilential Carbuncle requires that, as soon as may be, Suppuration be promoted, and the fatal propagation of the evil be prevented. To doe this, I have not found any better means than an actual Caution, which also is a way acceptable to most Chirurgeons; but to some this seems too cruel an operation, and out of a perverse pity, being more sensible of its violence than the Patients themselves, they chuse a potential Caution, or a Vesicatory, both which I also use, when I think they are either strong enough, or I cannot use any other means: For sometimes the Physician is forced to give way to the pleasure of the All-knowing By-standers, though it be to the Patient's hurt. ¶ Carbuncles may be cured by stopping the spreading mortification of the adjoining parts; by separating the mortified part; and by cleansing and healing the Sore that is left. I have not hitherto known any thing that more powerfully, certainly and sooner stops the spreading mortification of Carbuncles, than Butter of Antimony, if it be anointed round the part affected; for then the corruption of the part, which so spreads and eats all before it, stops. Next to this I reckon *Magnes Arsenicalis*, made of equal parts of Arsenick, Antimony and Sulphur, and mixt in convenient Plasters: by help whereof the corrupted part is disposed to its separation: which same thing also the Butter of Antimony performs, for it does not only put a stop to the progress of the pestilent Venome, but moreover separates the corrupt parts from the sound. All Balsams of Sulphur, and especially *anisatus*, mixt with *Unguentum intrapharmacum* and *basilicon*, and applied to the Sore, do effectually cleanse the parts, when freed from the pestilent Carbuncle: And the same Balsam mixt with some common known Plasters doth heal up the Sore when it is cleansed.

Sylvius de le Boë, Append. ad pr. Tr. 2. in fine.

IX. Sleep is severely prohibited in a Carbuncle, because in it men think the Poison is drawn inwards, whereas notwithstanding one would conjecture, that in Sleeping the heat inclined outwards, from the Heat and Sweats that people are in while they sleep: Therefore it is not at all necessary to keep Patients several days from sleep, as I have sometimes seen, and so afflict and weaken them.

Platerus, Pract. l. 2. p. 714.

X. A Boy four years old, had been afflicted three days with a Carbuncle in the middle of his Forehead with a red Swelling, black in the middle; all his Face was puffed up. To stop it, I order presently a Caustick to be applied to the black part, and *Unguentum basilicon* with Treacle, Oil of Scorpions of *Matthioli* and the Yelk of an Egg to the Eschar; and a Cataplasim of Plantain to the whole Tumour: besides repeated Blood-letting and Cordials, I appli-

ed a Vesicatory to his Neck; the next day I find the Fever much abated, the Inflammation of the Tumour remitted, and all things asswaged. The benefit of the Vesicatory was here observable; for by deriving a great part of the virulent humour, it must be believed it performed the greatest share of the Cure: Therefore, I think, it should be used in every one, and applied near the part. I used no defensive of Bole, because of the hurt of Repellents in Diseases of the Face.

Riverius, Cent. 4. Obs. 9.

XI. In the City *Rapescurvensis* there is a Disease called *Malvat*, which is a sort of Carbuncle, of which all men, unless they pass nine days without sleep, do dye; In the mean time they make section round the Carbuncle, and apply Cupping-glasses, and at last they are cured with *Unguentum basilicon*. Without doubt this Disease is contracted from some latent Contagion in Sheeps-wool: for all the Inhabitants employ themselves in Woollen Manufacture; and therefore it only comes in the Face or Hands of the poorer sort. And Watching procured by any means does good, because in Sleep, a concomitant of this Evil, the Poison centres to the Heart.

P. t. Borel-lus, Cent. 2. Obs. 12.

Sam. Clossius ad Greg. Horstium, l. 7. ob. 12.

XII. It is distinguished from a Gangrene, not by sense of the part, for that is lost in both, but by scarifying the place: for if when the Flesh is cut deep, it be black, and neither froth nor corruption come out, but remains dry, with inward hardness, it is a Carbuncle. ¶ The greatest part whereof, which gave the denomination to the Disease, is as it were turned into a Coal; wherefore it is void of sense, and treated like a Gangrene, circumscribing and limiting it either with Medicines or Instruments. Yet a Gangrene requires another Cure, because it often happens, that the Gangrene is corrected, and the part is restored to its natural state, those things being evacuated which should be, and those applied which vindicate the part from putrefaction.

Medicines especially made use of by eminent Physicians.

1. The Leaves of upright Vervain beat in a Mortar with Fat, and applied, do wonderfully take away the crusts of Carbuncles, and stop fluxions to the place.

Ætius, l. 4. c. 58.

2. Take green Scabious, and beat it in a Mortar, then add the Yelk of an Egg, some old Hogs-lard and a little Salt, mix them well: it's an efficacious Cataplasim. I have seen a pestilential Carbuncle perfectly suppurated and overcome with this Cataplasim in 5 hours time.

Horat. Aug. genius, de Feb. l. 8. c. 10.

3. The Countrey people of *Naples* have a secret Remedy of the Leaves of Prickly Bind-weed: If they that have the Plague apply that side of the Leaf, which is smooth and glib, to the Swelling, it presently draws the peccant matter out: but if they turn the rough and white side, it repels the humour inwards.

Barthol. Hist. Anatom. 27. cent. 6.

4. A Cataplasim of a sowre-sweet Pomegranate, or of one sowre and another sweet, boiled well in Vinegar, is very good to take off the acrimony of the humour in all malignant and inflamed Pustules. It is found so by experience.

Chalmatus.

5. This is a wonderfull thing, and reckoned for a Secret; Beat Comfrey and Daisies between two Stones, and apply them for a Plaster.

Sebast. Cor-tilio.

6. Spirit of common Salt is a high Alexiterial Medicine, if some calcined Gold be dissolved in it. ¶ Salt of Toads burnt to ashes, extracted with water of *Carduus benedictus* outwardly applied wonderfully cures pestilential Carbuncles, and safely heals all Cankers. Half a drachm with Cinnamon-water is sufficient.

J. p. Fab.

Idem.

7. Take of the Root of White-lily, Marsh-mallow, each 2 ounces; Linseed, Flowers of Chamæ-mil, Mullein, St. John's-wort, each 1 handfull; Figs No 20: boil them in Milk, and so apply them. It is good

Rudolph. good also in pestilential Buboes, as I have experien-
Goclenius. ced.

J. Bapt. Van 8. If a deep blew Sapphire touch a pestilential Car-
Helmout. buncle, and be rubbed on it for some time, and
then taken away, it draws out all the Poison, if
its virtue be not weakened before: therefore some
use to circumscribe the swollen place by drawing
the Sapphire round it, lest the Poison should expan-
date farther, and invade some noble part adjoining.

Horstius. 9. Wheat chewed in a sound person's mouth, and
elst. 28. 1. 2. laid to the place, asswages Carbuncles, and then at
some distance draw it round the fore.

Parvus. 10. Rhadish root cut into pieces, and often laid
to the Carbuncle, draws out the Venom powerfully.
I have often used the following Remedy success-
fully, to assuage the heat and pain of Carbuncles, and
promote their Suppuration; Take of Soot scraped
from the Chimney 3 ounces, Salt 2 ounces, reduce
them to fine Powder, add 2 Yelks of Eggs, stir them
together, till they be in the consistence of a Pulvis.
Lay it warm to the Carbuncle.

Idem. 11. The Pulp of Quinces bruised, and applied to
Prævotius. a pestilential Carbuncle, cures it successfully.

Francisc. Va- 12. A Woman, that had a very bad Carbuncle ab-
leriola. out her mouth and lips, was thus cured: When I
had first scarified the place, I applied this Medicine;
Take of the Juice of Comfrey, Scabious, Marigold
(these have a wonderfull and powerfull property a-
gainst pestilential Carbuncles and Buboes) each 1
ounce, old Treacle 4 scruples, Salt 1 drachm, Yelks
of Eggs N^o 2. This Secret of mine never failed
me.

J. Vigerius. 13. You can apply nothing better to Carbuncles
than this Remedy; for it extinguishes the maligni-
ty to a miracle; Take of quick Lime 1 ounce, soft
Soap, what is sufficient; mix them. Make an Oint-
ment and apply it to the fore.

Weikardus. 14. The Carbuncle is forced into a narrow com-
pass, where it can doe less harm, if bruised Scabious
be laid round it on the sound place, and Tanfie be
laid on the Carbuncle, and it will be done more ea-
sily, if afterwards some Hellebore root be thrust be-
tween the Skin and the Sore, cutting a hole in the
Skin first.

with Water. We give some Meat-broth to six oun-
ces, with Oil of Almonds and Syrupus acetosus, each
3 ounces. When a Man has vomited, if the fit con-
tinues, it is a sign of thick Bile sticking to the Sto-
mach; therefore give 4 or 5 ounces of the Syrup;
and an hour after, except he vomit again of his
own accord, give him 6 ounces of new Oil of Al-
monds: for the matter being thus incited, deter-
sed and attenuated by the Syrup, may more easily
be carried off either by Vomit or Purge. Nor let
the Syrupus acetosus make you afraid at all, because (as
Avicenna teacheth) it converts Bile into Phlegm, and
Phlegm into Bile. And presently after Vomiting,
when the gnawing is laid, some astringent, streng-
thing thing must, according to Galen's advice, be ap-
plied outwardly. And thus you must proceed in
preventing remedies; you must again diminish the
matter, temper the heat of the Bile and Fever,
withdraw it from the Stomach, intercept its pro-
gress, and strengthen the mouth of the Stomach: In
the Cure thus; you must sometimes allay the Pain
with Anodynes or even with Narcotics; sometimes
you must discharge the cholerick matter by gentle
purging and vomiting, till the Heart-burn and Fe-
ver be diminished and quite taken away.

Idem, ibid.

III. In a Heart-burn with a Fever sometimes a
Vomit must be given, sometimes not: And at other
times it is more expedient either to purge or take
off the acrimony of the humour. If the Disease be
very small or moderate, though the strength be
good, you may omit cleansing the Stomach, and
proceed to strengtheners and qualifiers: If the Disease
be violent, you must qualify the acrimony and also
cleanse the Stomach: And when the Heart-burn is
laid, you must evacuate the whole Body either by
blood-letting or purging, as the nature of the Dis-
ease shall seem to require. Galen, 1. ad Glaucon, puts
this case. Come on (saith he) if one be in a Fever, and
there be a plethorick disposition, but proceeding from fresh cru-
dities, and he be heart-burned: or also, if he should vomit any
bad humour, and in his discharge shall be much offended, so
as to be very sick and restless, shall we here with respect to
the Fever try onely to evacuate the Plethora, which otherwise
without trouble we might doe? Or shall we rather provide for
the mouth of the Stomach; and afterwards, when this is grown
something better; evacuate the whole Body, as much as the case
requires? I think we should doe this last: for I have seen
many who have been thus held, some of them dye, others brought
to death's door, when the Physicians have attempted to cure
them, before they had strengthened the mouth of the Stomach.
Hence it appears, that when the Heart-burn is vi-
olent, we must not vacuate the whole Body; but
strengthen the Stomach, take off the acrimony of
the humours, and afterwards proceed to purge.
This indication of taking off the acrimony of the
Bile bore such sway with Hippocrates, that he, 4. acut.
in an acute Fever with Heart-burn, fearing the fu-
ture Symptome, gave boiled Asses milk. These
things must be done in the Fit: but in the time of
Interval, when this Symptome is laid, we must go
to the ordinary Cure; but when the Disease is very
violent, we must doe all at once, i. e. purge and
strengthen the Stomach, and take off the acrimony
of the humours. Now the Question is, What way
we should purge. As to vomiting, Galen in the fore-
cited place speaks thus; But such (saith he) as are
wasted with bad humours, gnawing the mouth of their stomach,
you must cause them to vomit with warm water, or water and
oil: If they be hard to vomit, you must first warm the places
near the mouth of the stomach, and the hands and feet; but if
they cannot vomit this way, they must provoke it by putting their
finger or a feather in their throat: But if this way neither will
doe, they must again take the best Oil can be got, a little
warm: for Oil usually does not onely provoke to vomit, but
also makes the Belly loose. And this is very good in the pre-
sent case: wherefore unless it happen of it self, it must be
procured by Art, and this thing above all we must attempt with
proper remedies. Where he proposes Medicines to
purge sharp and biting humours; such as both take
off

Medicines.

I. **I**T is no season to let blood, when sincere bile
offends, and it is onely admitted in three
Cases. 1. When there is a hot Intemperature of
the Liver, that produces very hot blood, which is
the reason, neither any fleshy nor fat substance can
be produced. So in Hippocrates, 5. Epid. A man in Ce-
nias was taken with most violent pains of his Stomach,
after he was let blood in both Arms, and a good
quantity taken away he was cured. 2. When a blou-
dy Ichor flows from the Liver or the whole Body
to the Stomach, because of the Suppression of the
hæmorrhoids. 3. When it proceeds from the Sup-
pression of the menstrua.

Fortis, con-
sult. 68. cen-
sur. 2.

II. Its legitimate and proper Cure is taking away
the Cause, which must be done in this order; When
the fit is coming, Vomit must be provoked immedi-
ately, after Galen's example, 6. in 6. Epidem. comment. 5.
who raised Vomiting either with simple Oil, or mixt

off the acrimony, and purge not onely by vomit but by stool: Water and Oil moisten, loosen and obtund; Oil answers this intention best, for sometimes it causes vomit, sometimes it gives a stool; yea, and sometimes it doth both; but because it doth not strengthen, but make lax, he therefore gives Wormwood boiled in Honey and Water: And at length, when Superfluities are every way purged out of the Stomach and Guts, he then applies himself to strengthening with astringents inward and outward. This way of cure differs from the former, where he supposed the Heart-burn less than to cause fainting, namely, such a Heart-burn as comes by fits and may be cured in the intervals: But here he supposes a dangerous Symptome, namely, Fainting. Therefore in the former Cure Galen would have us first strengthen the mouth of the stomach, and proceed afterwards to vacuate the whole by letting blood or purging, but here he makes no mention of evacuation: Again, in the former he would have us onely take care of the mouth of the stomach; but here he explains the way to mitigate, to purge by vomit and stool, and to strengthen. What therefore is the reason of this diversity? No other certainly, but because the Heart-burn, and all Gnawing of the stomach, is rather to be corrected with obtunding and alterative Medicines, than enraged with evacuating ones: But when necessity is urgent, we must make use of these, but then they must be moderate in their kind, such as both obtund and purge from the place, as in the case proposed by Galen, i. e. when Fainting is either expected, or actually present.

Hor. Augu-
genius, Tom.
i. Epist. l. i.
p. 128.

IV. Celsus, l. 3. c. 19. saith, the first Indication in the Heart-burn is, to apply Cataplasms to the Stomach, which may repress it: Secondly, to stop Sweating. For this he is grievously found fault with by some, because, when this Disease sometimes takes its original from the sole acrimony of humours in the Stomach; sometimes, beside that, from a base, poisonous quality; yet, before the peccant humour be either vomited or purged; or, if it cannot be evacuated, before its acrimony be taken off, or its base quality subdued, he applies astringent Medicines to the mouth of the stomach, whereby the matter is more stult, and rendered more stubborn in evacuation and alteration. Yea, Galen, l. ad Glauc. 14. while the bad humour is yet contained in the part grieved, he bids us in the beginning onely warm the parts near the mouth of the stomach, and the hands and feet to make the part affected lax, that so it may more easily discharge and divert the matter. All which things indeed, as they are true when the Disease gives truce, and time allows the use of such Remedies; so when the case is hazardous, and strength sinks (which is Celsus his case, wherein the Body is melted with immoderate Sweat, and the Pulse is low and weak) we must immediately have recourse to strengtheners, as Galen there advises, (See the place at large above.) Besides, astringents first strengthen the mouth of the stomach; but then they are the cause, that when it is strengthened, it forces the noxious humours downwards that used to rise upon it, which falling downwards, and stimulating the lower passage of the stomach, are at length discharged by stool.

Rubeus, com.
in loc. citat.

V. While the Heart-burn continues, and the matter is much diminished, we may safely proceed to things that intercept the course of the humours to the stomach, to be given two hours before the Fit (if a Fever be joined with it) And they are in crassating and astringent things; as, Take of prepared Pearl 1 drachm, true terra sigillata half a scruple, Scorzonera-water 4 ounces, Pomegranate-wine 2 ounces. Give a spoonfull often. You may add 5 drops of Tincture of Corall. If it be malignant, give new Treacle with Pearl.

Fortis.

VI. Hippocrates cured a Woman of the Heart-burn without intermission, by giving her Barly-grewel,

with some juice of Pomegranate in it, and eating once a day. Now if the Pain came from Cold; how could Pomegranate-juice be proper? If from Heat; why must she eat no more than once a day? For they that are so held; are hurt by nothing more than Fasting; insomuch that unless they eat something in the morning before their usual dinner-time, they either faint, or at least feel a greivous gnawing; and they are never better, than when their Stomachs are full of victuals, whereby the Bile is imbibed, and the close contracted Stomach is not receptive of it. Certainly her Disease was from a fluxion of hot humours, and they that are so held, must take food neither in a small quantity, nor thin, because such corrupts and increases the Cacoehymy; but if a good quantity and substantial be taken, it frees from fluxion and concocts. Nevertheless a great quantity taken often can never be concocted, especially in an indispensed Stomach; therefore they must eat plentifully, and but once. But because they cannot pass any long time without all manner of food, they should use some light and medicinal Breakfasts and Suppers, such as Barly-grewel with Pomegranate-juice. Therefore Hippocrates does not here mean by *μαστίχη*, all tasting of Food, but, one full dinner; so his advice is to dine once well, and at other hours to take a taste of something medicinal, which cannot load the Stomach; as if you should advise one to take a Tost and small Wine for Breakfast in Winter, and Pomegranate-juice in Summer; and for Supper, Barly-grewel, with that juice or a baked Pear.

Vallesius;
sect. 2. Epid.
lib. 2.

Medicines especially made use of by eminent Physicians.

1. The Stomach of an Osprey dried to Powder and drunk doth wonderfully help them that cannot digest their meat; but it must not be continued, for it causes leanness. ¶ In a continual Pain and Vomiting, when nothing will stay in the Stomach, this is an approved Remedy; Two Yelks of new-laid Eggs, a spoonfull of Honey, Powder of Mastick half a drachm, let them be made hot in live Embers in an Egg-shell; take this thrice a-day at several intervals.

Al. Benedi-
ctus.

2. A large Cupping-glass with much flame set on for an hour, cures forthwith, like an enchantment.

Casalpini.

3. I have known this Electuary doe much good; Take of Conserve of Roses 6 drachms, Spec. Aromat. rosat. 2 scruples, White-frankincense 1 scruple. Mix them, make an Electuary. Take the quantity of a Chestnut when you go to bed. ¶ Take of Sea-wormwood tops, Chamæmil, each 1 Pugil; White-frankincense one drachm: Boil them in a sufficient quantity of Water. Strain it. To 4 ounces of the Colature add of Syrup of the juice of Chamæmil, Feaver-few, each half an ounce; for 2 doses. With this I have eased most violent Pains in the Stomach and Intestines. ¶ This is a most present Remedy for the Heart-burn; Take of new Conserve of Roses 2 ounces, Spec. Aromat. rosat. 2 scruples, White-pepper 1 scruple: Mix them.

Grato, l. 11
conf. 6.

Id. lib. 21
conf. 10.

Idem, l. 2.
p. 314.

4. This Liguour appeases the Pain in the Stomach wonderfully, if half a drachm of it be given; Take of Mastick 4 ounces, the best rectified Spirit of Wine half a pound, Galangale 1 ounce; Infuse them, digest them, and distill them by an Alembick.

Deodatus;
pamb. hyg.

5. Oil of Sweet-almonds taken in some Broth, that hath had Citron-seeds boild in it, is of great efficacy; and so is Emulsion of Citron-seeds.

conf. 35.

6. The Sapphirine Oil of Chamæmil, given to 4 or 5 drops in Mint-water, is excellent for the Heart-burn.

Hartmannus.

7. In Heart-burning from acid Phlegm and crude Juices sticking to the Stomach, Oil of Aniseeds rubbed on the region of the Stomach is of great efficacy.

8. This

8. This is highly commended in Pain of the Stomach; Take of Nutmeg 2 drachms, Spirit of Wine 2 ounces, Honey of Roses till it be sweet; boil them a little; take 2 or 3 spoonfulls.

9. I can reckon up several who have been cured of most bitter Pains in their Stomach, onely by applying a Plaster of Gum Tacamahaca.

10. Take of Spec. Hiera 2 drachms, Diarrhodon Abatis half a drachm, and with Marmalade of Quinces not aromatized I have made Bolus's, and given them to several, who commonly the same day were all of them freed from their Symptoms.

11. In this Disease I use this: I take 3 Eggs and break them, and with Oil of Roses and Mastick I make Fritters of them, and apply them to the mouth of the stomach: It is an excellent Remedy.

12. I have often found 1 drachm of Powder of Calamus Aromaticus, given in 2 ounces of clarified Juice of Worm-wood hot, very effectual in the Heart-burn.

13. About 3 ounces of the Juice of Dill boiled in Water, and drunk, doth wonderfully relieve the Pain of the stomach, that is with reaching and hick-cough.

Catalepsis, or, A waking Senselesness or Stupidity, wherein a man retains the form and figure of one awake, when nevertheless all the functions of his mind and senses are asleep.

The Contents.

Cured by voiding Worms. I.

Whether Wine may be allowed? II.

I. A Girl not full eight years old in a Burning-fever was first taken with a deep sleep, and then with a Catalepsis, her Eyes being quite open: She took nothing down for seven days, but a little Chicken-broth with Purilane boiled in it; she lay pale, speechless, and without motion, onely she breathed with difficulty. The Mother, in utter despair of her Daughter, gave her a Suppository of Honey, with which she voided a knot of forty two Worms without any excrement, and presently came to her self. Some caliginous Vapours from these Animals in her Belly seized all the Senses of her Brain.

II. Galen, 3. simpl. allows Malmsey-wine to Cataleptick persons, after whose example Amatus permits Cretian. Wine is best with some Sage or Rosemary in it.

Catarrhus, or, A Catarrh or Defluxion.

The Contents.

The Head is often in no fault, and therefore not to be tormented with Remedies. I.

Many Diseases ascribed to it amiss. II.

Not cured by one way alone. III.

Concoction must be more attended than Evacuation. IV.

The Intemperature of the Brain not always to be blamed. V.

One caused by Cold needs not Medicines. VI.

Whether Blood letting in a Cold one be proper? VII.

When it may be stop? VIII.

When a Purge may be given? IX.

If a salt one falls upon the Breast, we must purge. X.

If we fear a Consumption, we must give a strong Purge. XI.

I. It is clear from Galen's Testimony, 2. de differ. Febr. cap. ult. that sometimes a Catarrh is caused by some fault in the blood, when the head is no way out of order. Therefore one cannot say absolutely that a Catarrh is the cause of a Fever. It is confirmed, because the subject bowels, or often the whole body may afford fewel to the Catarrh, the head continuing altogether unhurt: for the Catarrh sometimes arises from fulness of body, sometimes from the heat of the subject bowels, and sometimes from the weakness of the head, as is gathered from Galen ad Glauconem, cap. 15. While therefore the subject bowels abound with excrements, they conspire in production of the Catarrh, either because in a long tract of time they are indisposed, or because some error is committed in the first concoction, as when the belly is stufft with excrements, in which case the head may be sound: They err therefore, that apply Remedies, as Embrocations, Washings, &c. to the head, which is onely hurt by sympathy, when the subject bowels should be cured. ¶ Oftentimes excrementitious humours that are sent up from the lower parts to the brain, cause a Catarrh, and acquire a preternatural motion, the ordinary passages being obstructed, by which they use to be purged: And then the Catarrh is opportunely cured by opening the passages, together with gentle and continual Purging by Broths or some Decoctions, celebrated for several days. ¶ From Cauteries actual or potential upon the coronal Suture a Physician can expect nothing but great harm: for though they be commended by Aetius, Avicenna, Aegineta; yet I cannot approve of them. This Commendation is founded upon the old Hypothesis, That the Brain is the fountain of Catarrhs, which however is now expired. ¶ A Catarrh is not bred in the Brain, because either private or publick excrements are gathered there: Private excrements the Brain hath but few: The publick invented by Argenterius, that are confluent thither from the whole Body, are none, neither moist nor vaporous: It is a Fiment, that the Brain is like a Cupping-glass, or an Alembick, or like the Roof of a House that receives the Vapours from below; or like the Middle region of the Air, in which the Vapours ascending from the Earth are condensed, and fall like Rain or Snow upon the Microcosm. The whole Body gives occasion to these Catarrhs: This doth by the Arteries put away the impure Atomes of the Blood, before it comes to the Head, either upon the Membranes of the Nose or Jaws: These

These Membranes do imbibe and sweat out these Atomes after this manner: The Arteries, and partly the Veins also, are divaricated like Spiders-webs into the spongy flesh of the Nose and Jaws, and sweat through like dew, after the same manner that Aliment does, or Liqueur in a new earthen vessel. The Catarrh penetrating after this manner, while it is not altered by the Membrane, runs down thin, &c.

Id. m. ibid.

Crato.

II. Crudities are the cause of all Catarrhs. ¶ And there are Impurities, not onely through the fault of the first and second Concoction, but of the third also, which is onely made for the due nutrition of every part, of which depravation also the *Archeus* provoked by external causes, and therefore neglecting the office of appropriate digestion, is the cause. For it is a certain Axiome, where there is aliment, there is excrement; and, Where there is nutrition, there is also segregation of excrements; or, if the expulsive faculty languish, collection of them. Therefore there is no necessity, that we should so industriously fly to Catarrhs and Distillations of humours, when every part, if it labour of any Infirmitie, may manifestly gather its own proper preternatural excrements, the same way as *Helmont* hath explained it.

Frid. Hofmannus, m. m. l. 1. c. 11.

III. There is need of much caution and distinction in the Cures of Catarrhs: For an old Man, destitute of native heat, and labouring of perpetual Crudity, must be cured one way: A hot young Man, who abounds with a bilious and easily fermenting Serum, another way: They whose distempered Bowels and very moist Head create this Flood, one way: They that create themselves this trouble by Surfeiting and Crudities, another: A Catarrh in the beginning, while the humours grow hot, ferment, and are in motion must be treated one way: When the Ebullition is ceased, another: And we must proceed differently with respect to the quality, quantity and motion of the matter.

Franc. Ignatius Sharrmair, lib. 2. conf. 1.

IV. The concoction and maturation of Defluxions, is the moderation or adequation of their substance and qualities, which especially cures and ripens Fluxions. Therefore *Hippocrates de vet. Medic.* "Fluxions (saith he) which, I think, are all caused by the acrimony and intemperature of humours, are recovered and cured, when they are temperate and concocted, that is, made thicker: as in an *Ophthalmia*, the heat and inflammations of the Eyes cease, when the Fluxions are concocted and made thicker, and the weeping matter of the Eyes stop: And concoction is made by thorough mixture and mutual tempering. And he subjoins. Moreover Fluxions falling upon the Throat, from which Hoarseness, Quinsies, *Erysipelas*, *Pneumonies*, all these first of all come down moist and sharp, wherein the Diseases are confirmed: But when, being made thicker, they are grown more ripe, and free from all acrimony, then both the Fevers, and whatever things offended by reason of the Defluxion of the Catarrh, are at an end. ¶ Nor yet are they to be irritated by Medicines, as *Plutarch* saith in his Book to *Apolonius*; "Neither (saith he) do the best Physicians presently draw out their Auxiliaries of Medicines against copious Defluxion of humours; but they let the gravity of the Phlegm by outward anointings ripen of it self, because time uses to ripen all things. And that this does not onely hold good in Diseases of the Body, but in Passions also of the Mind; *Oceanus* also hath left us it in *Aeschylus*, who persuades *Prometheus* that *Jove* was not to be prayed to nor addressed in the first heat of his Fury, but after he had concocted his anger.

J. Langius, Epist. 160. lib. 2.

V. Sometime the Brain is temperate, yet fruitfull in Catarrhs; because of the narrowness of the passages either natural or acsititious, by which it purges the excrements into the nostrils: therefore when its excrements do not run by their due cha-

nels, being increased in the Brain, they cause distillations by other ways; which appears in those that snore and keep the nostrils open in their sleep.

Zecchius.

VI. Sometimes the humours offend neither in quantity nor quality; but are suddenly squeezed out onely upon occasion of the Cold that shrinks the part in good strength, whereas they would otherwise have been expelled in a longer tract of time. He that would treat the mittent part in this manner disposed with Medicines, might cast his Patient into a Fit of sickness. I have sometime seen persons well in health, that have been tormented some days with a Distillation of the Brain, by reason of the cold Air, who within a short time after, the matter being consumed, which could not be contained, because the parts were contracted by the external Cold, remained well in health, because the mittent part was every way sound. Empiricks, while they prescribe Washings, Embrocations, Cupping, and things of the like nature, to these men for the cure of the part mittent, do fall into a manifest error.

Sanctorius, meth. vit. err. l. 10. c. 2.

VII. Sometimes in a cold Distillation we must begin with Blood-letting, when a plenitude is annexed, common or determinate, and that mixt. And this must be done, when the matter that falls upon the Lungs and Breast gives some fear of a *Pneumony*, *bañard Pleurisie* or *Quinsiey*. ¶ Blood-letting is not convenient, because it renders the humours more fluid: therefore unless the Lungs, or Sides, or Breasts be disaffected, we must onely use Purgation. ¶ One of these five conditions do best shew it. 1. The Nature and Quality of the fluent matter; if the Fluxion be hot, sharp, and come violently, bleed; which you may know, if blood and half concocted spittle be raised by coughing, then it is evident that Exesion is made by tarrying for Concoction. 2. If the Fluxion fall upon a part, from the hurt whereof Life is endangered, we must not then stick to let blood. 3. If the Body be full. 4. If there be a continual or intermittent Fever, so it rise to putrefaction; otherwise the cure of a Catarrh may be expected from an *ephemera*. 5. We must bleed when the Defluxion falls so violently and suddenly that it cannot be spit up; for Nature is diverted, that it cannot so well send to the part affected. ¶ In a Catarrh *Rhaphes* would have a Vein opened, if after applying a Cloth to the Head, the Disease be neither taken away nor diminished: He hath respect to a hot Catarrh, wherein the matter is forced from the Head cooled by some external cooling cause; for he knew that sometimes in the beginning the Cold does overcome the Blood, and that if it be remis, it will go away with warm Cloths, for by using them but a little time, the Head is not so heated as to draw the Blood, but its Cold is onely taken off, and the Cold being conquered, the Disease is so likewise, that is, the expression of the catarrhus matter ceaseth. Sometime the Cold of the Head is overcome by the Blood, if the Cold be so fixt, that it will not give way to hot Cloths, wherefore the Disease is neither taken away nor diminished: And therefore it is necessary to use those Medicines that heat more than hot Cloths; and then if Blood should abound it would be drawn to the Head: Since therefore the Blood is of more moment, than the Cold in the Head, a Vein must be first bled. ¶ Because it often so falls out, that a Physician happens upon suffocating Catarrhs; when there is fullness, and the matter begins to fix upon some noble part, he must immediately let blood.

Saxonia, pract. pres.

Joubertus.

Mercatus, cap. proprius.

Capivacius.

Claudius, de Catarrhis.

VIII. We must much scruple to proceed to stopping things; for unless grievous Symptoms do urge, we must not use stopping things before purging or revulsion of the humours; yet if the humour do so pour upon the Lungs, as by its sharp violence to cause a grievous Cough, or to endanger Suffocation or Exulceration, we may presently, before we purge,

Hennius.

purge, stop its unbridled motion. We must contrive to give these stopping things at night and after Supper; for what matter is already got into the passages, should be expedited: but at night all things have a motion thither, for the juices in sleep creep inward. ¶ It is queried whether a Catarrh may be stoppt, for it is not lawfull to drive back a noxious humour into a principal part, as the Head is, and to stop up the passages whereby it should be evacuated? But we are not willing to stop up the passages, but onely to thicken the humour, that it may more easily be discharged, lest it should cause a greater mischief.

Enclir. med.
Prad.

IX. Purging may be used in Patients, when there is imminent danger of Suffocation or Consumption, without any preparation premised, whatever they think to the contrary who fear lest a Purge should disturb the humours and carry them to the place affected: which reason has no weight with me, for upon the same account we might never give a Purge in any Disease of an inward part, lest the grieved place should receive the moved matter. ¶ Concerning the use of Purgatives observe; First, they are convenient when matter should be purged from the whole; because from 4. *acut.* 85. we must not use Hellebore in every Catarrh, seeing sometimes we must onely look after the Head, when namely the matter offends not in the whole. Secondly, when Purgatives are given, coction of the matter to be carried off must ever be supposed, at least in the whole; for seeing that in a precipitate Distillation it must be supposed, the peccant matter for the greater part is driven from the whole to the head, as to a weaker part, it seems rational to conclude, that what remains in the whole is concocted and conquered: for if there be any bad excrements in the body, and they separated from the good juices, for the most part they are transmitted to the weaker parts, and therefore may be purged as if concocted: for this reason *Galen*, *loc.* 2. gave a young man *Coloquintida* that was sick of an *Alopecia*, as soon as he visited him. But whether may we purge the matter of a cold Catarrh at the beginning without preparation? Some would have it so for this reason, because if it were copious and fell extreme violently upon the Throat or Breast, there would be imminent danger of Suffocation and *Asthma*, which could be no way stoppt but by Purging: But if a Purge should be given because this matter by reason of its toughness and thickness resists the Physick, it may easily be disturbed, and being thrown upon the same parts, may create those very same evils, or worse. Therefore I think sharp Clysters should be used in their stead. ¶ If fulness compels us to evacuate the body, we must use such things as leave some attraction behind them.

Cludius,
Tr. de Catarrho.

Kondlerius.

X. If a salt Catarrh fall upon the Breast, we need not hesitate about the use of Purgatives: for *Galen* himself, 5. *meth.* 14. gave a Purge of Pills made of Aloes, Scammony, *Coloquintida*, Agarick, *Bdellium* and Gum-arabick, the use of which would yet be safer, if some Whey of Goats-milk prepared were given when they begin to work; or Barley-water to two or three pounds. *Ele& de succ. Rosar. Diasepsi. solut. Troch. de Violis cum Scammon.* &c. do purge the thin matter, without waiting for concoction.

Fortis,
cof. 18.
cent. 2.

XI. When the Bowels and Bloud are brought to good temper, some Head-pills made of *Coch. simpl. Aureis* & *Mastick* may be given twice at least; seeing *Galen*, 5. *meth.* 14. made use of very strong Pills of Aloes, Scammony, *Coloquintida* and Agarick, even in an Ulcer of the Lungs. Yet they should always drink Whey or Barley-water after these Pills, to hinder drought and heat in the Bowels.

Idem, cof.
18. cent. 2.

Riverius.

XII. If a Catarrh be very stubborn, we must have recourse to Vomits, which powerfully root out the matter of it. ¶ We must give Hellebore to them that have a Defluxion falling from their Head. *Hippocrat.* 4. *acut.* 302. By give Hellebore, that way of Purging onely must be

understood, which is made by Vomiting: for it is certain, that when there is mention made of Hellebore simply, the white must always be understood, which the Ancients used frequently to purge upwards with all. And *L. de loc. in b. f.* 2. v. 133. When a Defluxion from the Head is coming, he affirms that a Vomit is convenient; and the reason is, Because the upper parts, where the root of the Disease is strong, are emptied; and a revulsion of the humours is made, which falling downwards might create Diseases in the lower parts.

Pr. Marfianus,
comm.
in eum lib.
c. 11.

XIII. In a suffocative Catarrh Vomits may serve for most Medicines, because when they are seasonably given, both the antecedent and the continent cause is removed from the Pipes of the Lungs. Yet it must be observed that if the fault lye in the whole mass of blood, and bad humours mixt with the blood be carried with the Arteries forcibly to the Lungs, and be so raised by some exotick ferment, that there is great danger of Suffocation; as it often happens in the Scurvy and Hypochondriack Diseases, then Vomits doe no good, but Blood-letting.

Frid. Moemannus,
m. l. c. 2.

XIV. They that are often troubled with Defluxions, sometimes fall into a suffocating Catarrh, which is no less dangerous than an Apoplexy. Now, according to the advice of Physicians, blood must presently be let, Frictions upon the Shoulders, Neck and Arms, and strong Ligatures must be made: A Vescatory of Leaven, *Cantharides* and Vinegar must be laid on the coronal Commissure: *Loch de scylla cum Oxy-melite* & *Ammoniaco* must be given if the matter be thick; or, if it be thin, we must proceed to *Pilul. de Cynogloss.* (yet we must not exceed one Scruple in a dose.) I mention these things, because in sudden Diseases the minds of Physicians are often in such consternation, that they cannot think of Remedies. ¶ A Physician often happens upon suffocating Catarrhs, concerning which my advice is, that when there is fulness, and the matter begins to fix in any noble part, Blood be immediately let: besides, to dilate the Breast and get Breath, let a Cupping-glass be set upon the *Vertebrae* of the *Thorax*; and for the same purpose and to divert, let Cupping-glasses be also set to the fleshy parts of the *Scapulae*. For so many escape, whereas several miscarry, when men go to work with other Remedies, that disturb the matter.

Crato.

Claudius.

XV. This is incident to all Diseases which come of a Catarrh, that the more we endeavour to evacuate and repel, the more we irritate the humours: And what is the reason? The humours go not whither we please, but whither the way is open; an unavoidable argument that the laxity of the passages is the proximate Disease: But why then do we use such things? That when the humours are diminished, the Disease may be shortened.

Hofmannus
in Inst.

XVI. I had a Patient forty years old, cholerick and lean, who had been four years troubled with a sharp and salt Catarrh falling from his Head upon his Lungs: I made him, at the beginning of the Cure, two Issues between his Shoulders, two inches on each side the *Spina dorsæ*; and I ordered him to apply a Cupping-glass upon them once a week: which Remedy did so much good in respect of the Serofities, which were drawn out in great quantity every time, that I must needs ascribe the whole Cure in a manner to it.

Jo. Marfianus,
ad Riverium, obs. 6.

XVII. I put a stop to a Catarrh falling violently upon the Palate and Throat, and threatening very bad Symptoms, when it would yield to no Remedies, by a Seton in the Neck, and so conquered and bridled its malice. When it has been worn some months, and after the Patient is recovered, an Issue either in the left Arm, or right Thigh, may not be amiss.

Claudius,
cof. 18.

XVIII. To hinder a Catarrh from falling upon the Breast, it is sometimes necessary to blister the Head, to the end that the Catarrh may be dissolved, and get out

out at the Skin, and not fall upon the Lungs; which nothing but very hot things will doe, such as put the whole body in a heat: Therefore it is dangerous in Fevers to apply hot things to the Head. Instead whereof I would have the Head shaved very close, and Powders (because hotter things cannot be approved of) of *Sandaracha*, *Mastic* and *Roses*, which do not heat violently, but dry and comfort the Head, so that the matter does not fall down.

Montanus,
conf. 145.

XIX. It is known, that in the descent of a Catarrh, which for the most part causes a violent Cough, things which irritate much doe hurt in the beginning. And I would have this carefully taken notice of, (for I have observed it) never to give irritating things, and such as help to raise Spittle near night or in the evening about bed-time: for if it be done, then Sleep is hindered by the commotion of the matter, and there is often danger of Choking, while the matter moved by violent straining to cough, is precipitated downwards on a sudden. Wherefore, that both Sleep may be promoted, the matter of the Catarrh concocted and thickened in time of rest, and the strength of the Head better confirmed, it will be good, while one sleeps, to hold Sugar of *Roses*, or something else in the mouth, that may thicken the humours, and to abstain from all things that provoke coughing: But if, after sleeping time is over, there be occasion for things that help to raise easily, let moderate ones be used, lest the disturbed matter create more apparent trouble, and the falling of the Catarrh be increased.

Oethaus apud
Schenckium.

XX. Sometimes Receipts to stop Defluxions must not be made of very sweet things, because of the Patient's palate; or rather, because over sweet things cause a Defluxion; As once I made some of *Acacia* and other tart, and not very sweet, things for Cardinal *Turaine*, whereby he found great benefit: For those holes, that are behind the *Uvula*, by which Phlegm is purged, are lax, and Phlegm continually runs through them: Therefore that part is to be strained: But let Spike and things ingratefull be omitted, and Cinnamon also being of thin parts, because it raises Defluxions.

Rondeletius,
p. m. 984.

Sylvaticus,
conf. 93.
cent. 1.

XXI. In a hot Catarrh cold Spaw-waters are good, for twelve or fifteen days, ten or twelve pounds a day, for while they pass by Urine, they open obstructions, and cool the Liver and Head, which will then grow dry. ¶ When the Head is dried, and the Lungs themselves in some measure, their exsiccation and strengthening must be perfected with sulphureous Waters, taken inwardly for twelve days, with something that is laxative: for a better Remedy cannot be found in the whole Art; which yet are no way convenient, except the Head be first dried, because they affect the Head, fill it, and melt the humours, and so encrease Diffusions, whereas nevertheless when the Head is dried, they doe it no harm, but dry it more.

Fortis, cent.
2. conf. 13.

XXII. Some Physicians propose Whey of Goats-milk for subduing a hot Diffusion: but I reckon it hurtfull, because though it cools, yet it moistens; and, which is of greater concern, it so fills the Head itself, that men obnoxious to Diffusions, by the use of Whey, fall into the Gout. ¶ I prefer the Spaws before Whey of Goats-milk, for Whey, as it is a moistner, cannot chuse but increase Defluxions.

Saxonia,
Præf. præf.

Sylvaticus,
conf. 93.
cent. 1.

XXIII. There can nothing more hurtfull be used in Diffusions, than such things as simply attenuate the humours: Which I would have the Moderns take notice of, who in cold Diffusions so willingly fly to Decoctions of *Guaiacum* and other attenuaters, not considering that by the use of these things Diffusions increase daily, which should be cured by Concocters and moderate Thickeners, as *Hippocrates* teacheth.

Martianus,
Com. in v. 14.
lib. 6. l. 2.
Epid.

XXIV. In a phlegmatick Catarrh it is a piece of rashness to hope for a Remedy by raising a Fever,

another way of cure not being first tried by evacuating, inciding, concocting and aperient Medicines; especially if you know the man to be one who is not lightly in a Fever: yet sometimes we must come to a Fever.

Valerius,
meth. med.
l. 2. c. 13.

XXV. It is an error of the Moderns, to use Decoctions in water for Fluxions; seeing it is evident, that whatever is taken in form of Drink, though it have a drying faculty, yet it always increases moisture in the body, especially if it be taken with food.

Martianus,
com. l. 1. sect.
2. de morb.
mili.

XXVI. *Avicenna* approves of bathing in sweet water both for a hot and cold Catarrh: If it be cold, he disapproves it, before maturation: In a hot one, he approves of it, because the matter gives way; but not in a cold one, because the matter is thick and viscid: If a Catarrh be imminent, he forbids it; because it moves the matter. And while the Patient uses it, he ought to sweat, for so the faulty matter is evacuated, and drawn to the out side of the body. ¶ When the Body is full, and the Diffusion yet crude, I think Bathing not convenient, because it melts the humours; otherwise it draws from the Head, and moderately digests.

Capivaccius.

Fortis.

XXVII. I have observed, in those Cities where Diffusions from the Head are familiar, (such as Rome is) that Women, onely by Washing their heads, are presently eased of their Head-ach, which has its original from a Catarrh. For by it the Pores of the Head are opened, through which the Vapours, that are retained by the Closeness of the Skin, and that increase the Diffusion, may exhale, and the acrimony of the humours is mitigated, which is the cause that Fluxion remains, and causes Pain. ¶ I do not approve of Washing, with a Decoction of cold and drying Herbs; because for the most part people offend in wiping it. But if either custome or necessity require it, a Ly with some Leaves of Red-roses and Myrtle may be used, so the Head be washed afterwards in cold water, and a hot Cloth, fumigated with Powder of *Roses* and *Storax*, be applied.

Martianus,
in vers. 14.
sect. 6. l. 2.
Epidem.

Crato apud
Scoltium
conf. 21.

XXVIII. Some disapprove of Fumes, building upon that of *Hippocrates*, aphor. 28. 5. But if, when the Body is purged, and the Veins of the whole habit abound not with bad hot Juices, they be made use of, it is certain they sometimes help a cold Brain; such as are made of *Nigella*-seed, *Frankincense*, Sugar, hot Vinegar, Powder of *Storax*, with Sugar and a little white Amber. You may refer hither Smoak of Tobacco, which draws much phlegmatick humours into the mouth; *Hearnius*, l. 1. meth. ad praxim mentions it. Tobacco (saith he) taken in smoak is endowed with a wonderfull virtue, for it brings away great plenty of Phlegm out at the mouth and nostrils: The dry leaves are cast upon hot coals, and the smoak is taken in at the mouth wide open, by a narrow funnel: for it goes through the whole brain; and it may be got into the ears or womb the same way. I can affirm, that this herb is peculiarly adapted to the brain, that it easily affects the way thither, and doth cleanse it from all filth. But the frequent smoaking it does violence to nature, especially in young and cholerick Bodies; as it does good to cold and over moist Brains, that overflow with Water and Phlegm. Let this be the principal Caution, that it be used for necessity, but not for wantonness, there must be sparingness and measure; first, let the whole Body be purged, and then the Head with Sternutatories. *Crato* in *Scoltius* condemns much Fuming, which, he saith, must be avoided by People subject to Catarrhs, and such as have a Weak head: And he condemns the custome of the *Italians*, who heat some Tow in the fume of *Frankincense* or Amber, or some such thing, and apply it to the coronal Suture; affirming that they doe hurt, by stopping the matter of the Catarrh where it is in great quantity, and especially if the Head be hot. But lest the Head should be oppressed, let the Cloths be fumed without the Chamber.

N

XXIX.

XXIX. Plasters applied to the head stop the Defluxion for a time, afterwards the whole matter falls down on a sudden, whence comes sudden suffocation: It stops for two or three days, because it suspends the Catarrh; but in the mean time this increases, and by its sudden descent in two hours time kills a man.

Montanus.

XXX. In a stubborn destillation of the head I allow of Fomentations by the frequent applying of bags filled with Millet, Bran, Salt and Marjoram, but with rubbing with warm cloths; that the heat may reach deep, and concoct the humours: for no man can be ignorant that frictions must not be used in destillations of the head.

Zecchiuz;
Conf. 20.

XXXI. Anointings proposed by *Trallianus* are to be omitted, as useless in a cold Catarrh, and suspicious in a hot one. *Galen* 3. *Metb.* 13. applied Rubificants of Pigeons dung and Stavesacre with good success in a hot Catarrh, to draw back and divert the violence of the defluxion, but not to take away the cause; therefore *Trallianus* found fault with him without a reason: Yet I think we had better not meddle with these two Medicines, since it is not granted us to imitate him in all things; onely indeed they are safer in a cold one, yet suspected when there is a sympathy with the parts below. *Aetius* also is of the same opinion, and subscribes to *Galen* himself, who 6 de *San. ch.* determines the contrary. Wherefore it is safer in the beginning to apply our selves to revulsive, diverting and intercipient Medicines.

Fortis, conf.
14. cent. 2.

XXXII. A drying Diet seems convenient by the law of contraries, because abounding moisture makes the Catarrh. But what is the material cause of Catarrhs? A multitude of phlegmatick, thick, tenacious and cold humours: now consider well whether Plenty do not require evacuation, thickness attenuation, toughness detersion, or inciding cold heating: what vacuation a drying diet makes, will not take away a great quantity, because onely thin and serous humours are evaporated by it, the thick are made more stubborn: Neither will it attenuate or absterge the humours, for the heat acting upon the humours, first consumes that, which can easily be transmuted into Vapour, and acts but dully upon the thick and tough humour, which should first be consumed, seeing it causes and encreases the disease: Nor is the heat of any use that is procured by a drying diet; for all heat, when it hath not whereupon to act, preys upon the radical moisture: Therefore a drying diet is useless, both because it deprives the body of nourishment, and because it renders the humours more stubborn. Tough humours in the body are made fluid the very same way, as Artificers Glew, which is made liquid not with dry things but moist. *Galen* treating *Lib. de atten. visci. rat.* about the expectoration of those things that oppress the Lungs, saith, that what is got out of the Lungs, must not onely be incided and made hot, but must be moderately moistened, lest the spittle be hardened and made tough. But the humours that are carried to the head can be attenuated no other way, than they in the Lungs. *Galen* indeed saith there, that bodies in which cold, thick and tough humours abound, are relieved by the use of attenuating meats: But this opinion must not be translated from Bodies to Humours, which must not be attenuated by actually dry things, but by supplings wherein inciders are boiled, and those actually liquid.

Borallus de
arrho, cap.
10.

XXXIII. The choice of a convenient posture for the Head, hath respect either to the ascent of matter to the head, or to its descent from the head upon the parts below. As for the Ascent, it is certain that the humours will get to the head with more difficulty in an erect posture, than in a leaning one, because the humours by their proper gravity run downwards of their own accord; which every one may easily experiment in his own hand, if he let it hang down. As for what concerns the descent of

the Catarrh, it is undoubted that the humours contained in the head will descend more readily in an erect posture by the help of their innate gravity. Therefore if the parts receiving the Catarrh be more grieved than the head that sends it, a leaning posture is proper for it. But if benefit accrue to the head, by unloading it self upon the more ignoble part, then put an high pillow under the head. And according to *Celsus*, *lib. 4. c. 4.* if there be difficulty of breathing, which often happens in a destillation, the Patient must lie with his head high.

XXXIV. Exercise of all the lower part is very necessary, for for this very reason Weavers are not so much troubled with Catarrhs, because they exercise their feet much.

XXXV. *Hippocrates* 6. *Epid.* writes indeed, that *Venus* is good for phlegmatick diseases, the abundance of Phlegm being dried up, where there is strength for it. Yet from hence we may not infer that it is good for people in a Catarrh, nor yet from the history of *Timocharis*, who, he saith, had a destillation in winter, especially upon his nose, and when he had used *Venus* it dried up: His nose indeed grew dry; but it is ill concluded from thence that his disease was cured; seeing *Hippocrates* subjoins that lassitude followed, and heat and dulness in the head, diseases worse than the Catarrh. *Saxonia* thinks this opinion of *Hippocrates* applicable to hot Catarrhs.

XXXVI. *Calligenes* (*lib. 7. Epid.*) in the Twenty fifth year of his age had a Catarrh, and violent cough: he brought up what he raised with great violence, nothing staid below that fell down, this lasted four years: Hellebore did no good, but a moderate Diet, and to macerate the body, to eat bread, to abstain from sharp, salt, fat things, *succus Silphii* and raw hearbs, to walk much: Drinking of milk did him no good, but drinking pure *Sesamum* with soft wine. Hence it is manifest, the Catarrh came not so much from a multitude of humours in the whole body, or in the head, as from a proper intemperature of the Brain; so that the excrements did not so much cause the intemperature, as the intemperature caused the excrements: for if excrements had been the chief cause of the disease, purging would have done good; but because the intemperature was the first cause, and the intemperate Brain did breed matter for destillation, of its proper aliment, which it badly assimilated, Hellebore did no good, but abstinence from meat, and to grow lean again with fasting: for so Aliment was subtracted from the Brain, and in penury of it there was less superfluity to destill, and the Brain was dried with fasting, and so the moist intemperature of the Brain came to be amended. Moreover he was hurt by hot, sharp, salt and fat things, because such things, beside their heat, have qualities that exasperate the Lungs, and provoke coughing: for sharp things prick, salt exerce and corrode, fat cause some tickling: He was hurt by *succus Silphii*, which is sharp, hot and windy, because thereby his head was filled and made hot, and for that reason his destillation ran the more: Raw herbs hurt him, because a gross vapour, that fills the head, was raised from them: Drinking of milk was not proper, because it is bad for the head-ach, and upon the same score likewise for them that are apt to have their heads filled, though without aking, wherefore it must be avoided by People subject to Catarrhs: Much walking did good, for it is a dry cause: But understand withall, seasonably, for otherwise he had better not have walked at all: Friction also had been good, and watching, so it had not been too much: His meat was bread, a food truly every way moderate, and without all fault, unless too much be eaten: He was relieved by drinking soft wine and pure, crude *Sesamum*: Soft sweet wine is good for a cough, and for them that cannot raise by spitting, as also is *Sesamum*, because of that smooth Mucilage it hath. Which Potion is more

Vallesius,
com. in loc.
611.

more accommodate to diseases of the breast than to a Catarrh from intemperature of the Brain: Certainly it could do the Brain little good; yet it did good, because it would suffer nothing of the defluxion to stay below.

XXXVII. N. Fifty five years old, of a hot and moist complexion, after many errors in living, especially cares of the mind, studies and drinking strong wine, born of Parents who were subject to Catarrhs, was taken with a distillation from his head upon all the right side of his body, with a little immobility of the tongue, and of the arm and leg on the same side; all which diseases nevertheless gave way to convenient remedies, onely some dullness, and a sense of weight remaining in his right arm and leg, which hindered him from going about his business: He complained also of some weakness in his head, so that when he looked upwards or downwards, on one side or the other, and brought his head again into its natural posture, he remained dull as it were stoned; yea, sometimes he staggered: And although he had an Issue made for it in his neck, and right arm, yet he found no good by them: He tried the Leaden waters to no purpose. *Prevotius* advised him with good success to medicinal wines, Turpentine with *Castor*; a decoction of box, *China* root, Mistletoe of the Oak, Mastic Tree, Sage and Groundpine: Besides, Treacle with Sugar of Roses: And among external things, Goose grease with Spirit of Rosemary applied with Scarlet to the nape of his neck after embrocation.

V. Vallesius,
Obs. 14.

Medicines especially made use of by eminent Physicians.

Aecorom-
bonus de Ca-
tarrho.

1. I affirm I have seen several cured by the continual use of *Diacodium*, who have been in manifest danger of a Consumption from a thin and salt Catarrh. ¶ Take of Cloves, Cinnamon, Mastic, Mace, Benzoin, each 1 drachm, Cipresnut, red Coral, Pomegranate flowers, each 2 scruples, mix them, make a powder, and apply it to the Coronal suture; both I and others have often tried the virtue of this powder, and we have found it stop distillations in so short a time, that it has appeared wonderfull both to our Patients and us.

Idem.

Agricola.

2. The tincture of *Luna* is very good for distillations; Take of Spirit of Vitriol 4 drops, Tincture of *Luna* 8 drops, Water of Mother of Time half an ounce, Oil of Amber 5 drops. Mix them, give it every day. ¶ This is a secret for Catarrhs never enough to be commended. Take of white Sugar 3 pounds, Root of Liquorish, Elecampane, Flower de Luce, each 2 ounces, Spring-water 24 pounds. Boil them, filtre them well. To 8 pounds of the Colature add of the herb Speedwell, Maiden-hair, Lung-wort, Scabious, Horehound, the cordial flowers, Colts-foot, red Poppy, each 5 Pügils, Roman Nettle seeds, and of seeds of *Cardus benedictus*, Anise, Fennel, each half an ounce, infuse them 2 days, and boil them again to a third; add of Gum *Guaiacum*, *China* root, each 2 ounces, Cinnamon, lesser Cardamome, Cloves, each 3 drachms: boil them over a gentle fire for an hour, filtre them, and strain them. Drink of it four or five times a day.

Idem.

Bartolettus.

3. In a suffocative Catarrh I use with great success water of Violets or Colts-foot, with white Spirit of Sulphur, dropt in drop by drop in danger of suffocation; and I have delivered several from imminent danger.

Petr. Bay-
rus.

4. Take of Aloes, Peiniroyal, Calamint, Mint, Citron rind, each a like quantity, make a powder; incorporate it with *Ladanum* and a little *Acacia*; and apply it to the Coronal suture, having first shaved off the hair.

Alex. Bene-
dictus.

5. Terra Lemnia, or Bole Armenick, with wine is a most excellent Remedy in a cold Catarrh; for they effectually hinder suffocations.

6. A decoction of Turnips with butter and Sugar

is very good, or if there be any wind in the Turnips, it may be corrected with a drop of Oil of Aniseeds. *Crato.*

¶ In a salt Catarrh I have found this a most wholesome remedy. A Decoction of Honey with Roses, which is made thus: Take of pure water 6 measures, Honey half the quantity; boil it, and scum it, put a bag full of dry Roses in it, and boil them for a convenient time. Drink of it every morning. Also red Bole Armenick laid upon the Tongue and Palate at night especially, stops and dries a Catarrh, and wonderfully strengthens the head, so as it seems an Inchantment, it is as good as any Treacle. *Idem.*

7. A Lohoch of Oak of *Jerusalem* in diseases of the Breast is excellent for the Distillation falling on the Breast; it is made thus: Take of the juice of Oak of *Jerusalem*, Scabious, Speedwell, Colts-foot, each half a pound, Barley Cream 3 ounces, Sugar half a pound. Boil them to the consistency of a Syrup; add of *Species Diarvens simp.* half an ounce, powder of Aniseeds 2 drachms, Flower of Brimstone 1 drachm. Mix them. *Gul. Fabricius.*

8. This is very good; Take of Rosemary, Marjoram, *Nigella*, red Roses, Cloves, Nutmeg, Indian Spike, each half a drachm. Make a Powder, take it in a Pipe fasting like Tobacco. *Goclenius.*

9. In a thin suffocative Catarrh distilling violently upon the *Asperia Arteria*, and raising a continual cough, a little burnt Hartshorn held onely in the Mouth, or put upon the Tongue, is accounted an excellent Remedy: for the Catarrh is presently thickened, and the cough comes but seldom. ¶ Oil of Amber hath an admirable efficacy to stop a Catarrh, if some powdered Amber be put in a bag, and heat in Spirit of Wine, and sprinkled with some drops of Oil of Amber, and applied to the Crown of the head, the nostrils and Temples being both appointed with it at the same time. *Graba in Elapthograp. 212.*

10. This is an exceeding good sternutatory to dry and stop the Catarrh, and strengthen the Brain. Take of Darnel, Seed of *Nigella*, *Castor*, each 1 scruple, Marjoram, Rosemary, Sage, each half a scruple, Musk 4 grains. Mix them, make a powder, and snuff it up. Linseed infused in strong white Wine Vinegar, then dried, and strowed upon some coals, its fume received by the nostrils doth wonderfully stop a defluxion. ¶ The distilled water of flowers of white Dittany is also a celebrated Remedy, snuffed up into the Nostrils. ¶ This promotes expectoration of the thick matter: Take of the powder of Elecampane seed half an ounce, Savine seed 2 scruples, Honey 2 ounces, fresh Butter 3 ounces. Mix them. *Petr. Mich. el de Heredia.*

11. Sassafras wood is of excellent use in this disease, so that it is reckoned the true and proper Alexipharmack of Catarrhs, especially if it be infused with Spirit of wild Time, which is done thus; Take of field Mother of Time, distill it from strong wine, let it stand a few days, and distill it from fresh Mother of Time, and then infuse Sassafras wood in it. ¶ Nothing stops immoderate Catarrhs better than the following Cataplasme: Take of fowre leaven 2 ounces, Amber powdered 2 drachms; make a Cataplasme, and apply it to the Crown when it is shaven. ¶ Also in a suffocative Catarrh, Tacamahaca dissolved with some Oil of Mastic, spread upon leather, and applied to the Crown of the head, when it is shaven, is very good. *Frid. Hoffmannus.*

12. For a Catarrh with hoarseness I have had good success in this Medicine of *Forestus*: Take of Liquorish juice, white Sugar, each 2 drachms, seeds of Purilain, Cucumber, Melon, Citrus, each half a drachm, Aniseed, Gum Tragacanth, each 1 drachm, Penidy of Sugar 2 drachms and an half. Make them into sublingual Pills. ¶ I have had experience to my honour of this Electuary in several, in difficult expectoration, which threatned a Consumption. Take of Elecampane Root, Quinces, boil them with Honey, and add some flower of Brimstone. ¶ In thin distillations I successively use *Pilule de Styrate Cratonis.* *Gr. Morbidi.*

Johnstonus. 13. Pope Adrian's Wine is highly commended for a Catarrh: It is made of the Shells of all the Myrabalans, with their Kernels, first dried, each 2 ounces and a half, Cinnamon 1 drachm, Cloves, Galangal, Cubebs, Cardamome, Grains of Paradise, Nutmeg, each half a scruple, dried red Roses a drachm and a half, Flowers of Rosemary, Lavender, each one drachm; bruise them, and put them in as much Wine as is convenient.

Dom. Leo. 14. This is an experienced Medicine in stopping all Distillations, and very good for those that incline to the Phthisick and Consumption, and that are troubled with a Cough. Take of Cinnamon, Galbanum, Storax, Calamus, Pepper black, long and white, each half an ounce, Opium 3 drachms, Honey what is sufficient. The dose is the quantity of a Bean, taken morning and evening in Honey-water.

Lotichius. 15. Nothing better can be devised to digest, attenuate and evacuate successively by sweat matter settled in the Lungs, than a Decoction of Guaiacum-wood; which others as well as I have used with singular success, as the Bezoardick of this Disease.

Simon Pauli. 16. An easie Medicine is made of water in which unripe Quinces are boiled, against sharp Catarrhs, that are most troublesome at night: It must be well sweetned with Sugar, a spoonfull or two of which must be given to the Patient when he goes to bed.

Sennertus. 17. This is a very good conserve to stop a cold Catarrh: Take of red Roses 2 ounces, Species Aromatici Rosati 2 scruples, Nutmeg 1 scruple, white Frankincense 2 scruples, with Syrup of dried Roses or of Betony, make an Electuary. Take the quantity of a Walnut when you go to bed.

Arnold. Villa novanus. 18. Very good Pills to stop any Rheum flowing from the Brain, and to comfort the Brain. Take of Amber, Lignum Aloes, Ladannum, Frankincense, Storax Calamita, Myrrh, each 1 drachm, Wax, Opium, each 1 scruple, Musk 4 Grains; with very good wine make small Pills; give 7 of them late at night. This wonderfully stops a Rheum from a cold cause.

obstructions of the veins in the Womb would be greater, when their fulness were encreased.

III. In reference to the Cachexy, Medicines should be administered, which depurate the fleshy part, and clear it of bad humours, i.e. Diaphoreticks, insensible evacuators, and insensible digesters: To which intention sweat would answer, some convenient Decoction premised, or the use of Viperine Powder. But because our main scope should be to open the veins of the Womb, provoke the Menstrua, and purge the whole body by ways proper and customary to nature; therefore lest the humours should be diverted from the centre to the Circumference, laying aside this intention, we must first make use of aperient Hystricks, and promoters of the Menstrua.

Fortis Conf. 52. cent. 2.

IV. Because in this Disease Steel is very usefull and necessary, we must in this case take notice, whether the Veins about the Stomach and Mesentery, or the Liver and Spleen be more obstructed: for if the proper vessels of the Stomach be most obstructed, Steel must be given prepared in a more gross manner, and vomiting Medicines may be mixt with it, or a vomit may be given before the use of Steel, or on the intermediate days: for so, when the bad humours are cast up by vomit, the Bowels do easily recover: But if the humours hanging in the places near the Stomach, be carried to the more inward parts labouring of obstructions, the disease will be made worse. But if the Liver be especially obstructed, Steel must be given prepared very fine, and Epatick Medicines, and such as purge downwards, but by no means such as purge upwards must be mixt with it: And if the Spleen be affected, splenetick Medicines must be added.

Sennertus.

V. The Physicians School doth profess that Steel obtains the chief place in stubborn obstructions, which yet must neither be powdered too fine, nor burnt too much: For the former degenerates into Quicksilver, and then it provokes vomit and purging. The latter is deprived of its Sulphur and Mercury, by which means it becomes rather an astringent Crocus Martis, than opening: Wherefore in this case a Crocus Martis prepared with Spirit of Sulphur will be most convenient.

Fortis.

VI. Whether is Tartarum vitriolatum good in this disease? I hold the affirmative, because such Medicines are convenient, as incide the cold and viscous humours, and attenuate them, concoct crudities, open obstructions, and absterge the sticking matter, all which virtues are most efficaciously in Tartarum vitriolatum: for if Tartar considered by it self have no small aperient and absterging virtue, much more must be allowed to it Vitriolate. Yet we must have a care we proceed not inconsiderately to the use of this Medicine, nor presently; but the first ways must be prepared before by lenitives: which done, when we have purged twice or thrice gently, we may come to the use of it, yet according to the difference of its nature, a whole scruple, or an half, may be given twice a day in some proper distilled waters, or decoctions in which some convenient herbs and roots have been boiled: then the prepared matter may be purged and carried off by an infusion of Rheubarb.

Horslius cent. prob. 9. 24. 5.

VII. Before the use of attenuating and opening Syrups, the common ways must be purged, namely, the Stomach and Guts, from excrements and crude humours; lest the same things befall us which befell a certain Physician, who when by aperient and attenuating Syrups he would have brought her Menfes, he threw her into a Palfey. ¶ The Stomach must first be emptied by a clarified potion of Manna, or lenitive Eleatuary with Tartar, then we must come to the preparation of the first ways by repetition of the aforesaid things: Then the obstructions of the Mesentery and Lactéal Vessels must be cured with attenuating, opening and evacuating Medicines. But to complete the detersion of the Stomach and Bowels, some

Medicines.

I. Blood must be let, when the disease is new, and when it takes its rise from stoppage of it, before it acquire a malignant quality, sufficient strength and plenty of blood being supposed: Otherwise the disease would grow worse, if it be thoroughly radicated, if the Body be cool, and if phlegmatick, crude humours do rather abound than blood.

Ambros. Enchir. Med. Prae.

Fortis conf. 52. cent. 2.

Riverius.

II. A vein in the arm must be opened in the beginning, although the Menstrua be suppressed; for if blood should be then taken from the foot, the

some proper Spaw-waters may be given three days. The Cacoehymie must by degrees be taken from the blood by preparation and frequent purging. Nor must we fear Feverishness; for in this case we must have an eye onely to the Cause, and not look much upon the Fever. These three sort of purgers being taken, we must not believe that the whole

Forti, l. de Venous kind is cleared of its impurity, wherefore purging must be repeated, which may also have an opening virtue.

VIII. In uterine and hypochondriack distempers, seeing Sugared or Honeyed things doe not much good; therefore in the preparation of the Humours, clarified juices of herbs must be put in the Decoctions. Forti tranfcolates the juices through Sand, to purifie them.

IX. Whether should motion and exercise be prescribed to those that are sick of the Green-sickness? Idleness and Motion are equally hurtfull. Idleness, because it gives opportunity for heaping up of Crudities, whereby the disease increases: Motion, especially violent, because it raises the palpitation of the heart, which often endangers Suffocation: for the crude humours are put in motion, whence Vapours are elevated to the heart: Besides, green-sick persons are unfit for exercise, because their body is dull, their strength languid, and they are troubled with shortness of breath. But as exercise in this disease, towards the height, is unseasonable, so before it get any head, and when it is declining, it is very profitable; for the languid heat is excited in the bowels, concoction is better performed, distribution of the Aliment is helped, obstructions of the bowels are opened, motion is given to the humours, and way is made for Medicines: Yet a mean must be observed, and general evacuations must be premised.

X. Whether may the absurd things, which the Appetite craves, be allowed? We may sometimes indulge Women with Child; because the bad meats, which they long for, may serve for Medicines; or because if they should be denied, the Child might be marked, which would be worse. But these bad and absurd things doe Virgins harm, because the disease is thereby fomented and increased; nor can any emolument accrue to the body, or ought of the morbid cause be abated by such things as Lime, Chalk, Ashes, Oatmeal, &c. The grief arising from the denial of their desire is momentary, but the damage from such things is lasting.

XI. It is a common opinion that Green-sick Virgins, when they are Married, recover their health, and truly sometimes it happens, that pale and discoloured Maids, if they Marry, become lively, and acquire a rose colour in their face and body: On the contrary it is found, that others have not onely after Marriage not recovered, but grown worse. There is need therefore of distinction: for if the Illness have its rise from the retained Menfes or Seed, it is the safest way to Marry, for so the retained Seed is evacuated, and the Womb is purged: But if there be any evil disposition in any Viscus, especially the Liver or the Spleen, or in the whole body, this is not removed by the use of Venus, but rather increased, and the bad humours that abound in the whole body, are drawn to the Womb, and raise obstructions in it, whereupon long Fevers, and other evils arise: Such must be cured before Marriage, or if they be incurable, it is better to remain unmarried.

Medicines especially made use of by eminent Physicians.

1. The following Electuary of Steel is very good in obstructions of the inwards, especially in the Green-sickness. Take of Filings of Steel very fine, grind them with Vinegar, and dry them, this should be done seven

times. Take of this 6 ounces, Cinnamon, Candied Nutmeg, each 3 drachms, Rheubarb 2 drachms, Spec. Avomat. Rosat. 6 drachms, Honey and Sugar each 1 pound. Mix them, make an Electuary; but universal Purgation must precede.

Crato, obs. 1. Jing. Ep. 244.

2. There is nothing better than Quinifessence of Camint to cure the Pale, Wan-colour in Maids, for it most certainly and successfully promotes the Menfes.

3. They say, that in the Green-sickness from obstructions in the Spleen, an ointment of Ostridges greafe is very good: Some say nothing is more effectual. It is evident from observation that Bezoar-stone is very good, especially for Melancholick Women, taken in some appropriate water. I have experienced that Scorzonera Root steeped in some proper liquour and drunk in a morning, hath cured several. The best thing in the world for this Disease, is the water that runs from a Grind-stone whereon Swords are ground, if you quench red-hot filings of Steel an hundred times in it: for so I have seen large Splens wasted.

Mercatus.

4. In this Disease I have experienced the wonderful effects of Quercetan's Cachectick Powder, by means whereof I have cured innumerable Maids and Women of the Green-sickness.

Riverius.

5. The following Pills are kept as a Secret by many; Take of Juice of Mercury, clarified Honey each 1 ounce. Boil them to a sufficient consistency. Add of the Seed of Roman Nigella powdered 3 drachms. Make a Mass, of a drachm whereof make 6 Pills. Take two when she goes to bed for three nights one after another.

Varandius.

Medicines.

I. **W**hen the Vomiting and Loosness is stopt by the use of Medicines, and the strength something restored, the Patients seem out of all danger, which does not onely deceive the by-standers, but even the Physicians sometimes: for after one or two days quiet and intermission, the Symptoms return stronger and more violent, and carry off the Patient, who was weakened with the first fit of his disease. Which great danger must be obviated, not onely by Restoratives, and things that assuage the heat of the humours, which must be continued when the fit is over; but by letting blood, which draws back, and very much qualifies the torrid and boiling blood, and it must be repeated twice or thrice, if it appear after the first blood-letting that the strength is nothing abated, but rather augmented. Some in the very fit, and when the strength is exceeding

Horslius, cent. prob. 9. qu. 5.

Sennerius.

Sennerius.

ceeding low, which they say is not wasted, but oppressed, do open a vein: But with great hazard; for some have died in very bleeding, to the great reproach of the Remedy. It is true, there is some oppression, but then there is wasting of the strength likewise. Therefore it is better first to stop its violence, and when the Symptoms are laid, to have recourse to blood-letting.

Riverius.

II. If a Woman with child be taken with a Vomiting and Loosness in her seventh or eighth month, whether may she safely be let blood? If it be suspected in those that are not with child, lest the strength tired and wasted by great inanition, be wasted and sink more; much less may it be done in a Woman with child, who hath suffered already plentiful and immoderate evacuation from her veins: Besides, it proves abortive, while it deprives the Child of its nourishment, and the Mother of her Treasure. It is dangerous and hazardous thus to cure a Woman with Child: For if it be disapproved of by all Practitioners in a Man, and in Women that are not with child, it must much more be avoided in a Woman gone seven or eight months with child: Because to do it sparingly, is useless; for what is the emptying one small Blood-vessel like to do towards bridling the fury of the humours, or extinguishing the Fever, when the blood comes out but slowly, and the purest too, drop by drop.

Riolanus.
Enchir. l. 2.
c. 36.

III. Whether is there any use of Vomits? Hippocrates 5. Epid. cured an Athenian of a Vomiting and Loosness, by giving him Hellebore: but in lib. de affect. he would have the cure managed with moistening potions, and hot bathes, that if there be any thing hurtful in the Stomach, it may more easily be vomited up, and more readily be carried downwards, because if you evacuate violently, i. e. if you will carry off the reliques of the humours by Purging Medicines, a violent evacuation both upwards and downwards will follow, whereby the weakened Patient will be in danger. The contradiction is solved by this distinction, When it arises from Surfeiting and Drunkenness, as is supposed in the present case, because the corrupt food, that is the cause of the disease resides in the Stomach, and no fault of the whole concurs, we must not fly to Purging Medicines, which draw the Humours from the whole, where there is no fault, for so that would be Purged which ought not, and a disturbance being made in the humours, the conflux of them to the Stomach would be increased, weakened by the disease, and not a little hurt by taking of Physick. But when the disease depends on plenty of bile and other humours, which flowing to the belly, burst out Symptomatically upwards and downwards, then the total purgation of them must quickly be procured; and they must be carried off the less dangerous way, which is contrary to that way whereout they break naturally with greater violence. In the Athenian he gave a strong Vomit, because the humours that fomented the disease were peccant in the whole, and were carried more violently downward than upward.

P. Martianus
in v. 12. Sect.
2. lib. de
aff. c.

¶ When the Intestines are more affected than the Stomach, Vomits were better than Purges, that both evacuation of the whole body, and revulsion from the part principally affected might be made: for the thing we most fear in affections of the belly, is, that the body cannot be purged but by the part affected: therefore we must avoid it as much as we can, and if all parts of the belly be not sick alike, we must move by that part which is less sick; much more therefore in dysenteries, must we use Vomits. ¶ Hippocrates gave Hellebore to an Athenian; but though I like his method well; yet I approve not of his Medicine; there are much safer and more usefull Medicines, that Vomit far more mildly. ¶ They offend grievously that give Scammony, Hellebore, and Colocynthis in this disease; for a hypercatharsis (or over-purging) is raised, which a Convulsion (very familiar to this disease) swoon-

Vallesius, l.
5. Epid.Mercatus, l.
3. Pract. c. 8.Enchir. Med.
Pract.

ing and death doe follow. ¶ Add hereto Oribasius his rule, l. 7. If corruption of the food appear to you at the first, and the Patient void nothing in a manner either by Vomit or stool; but if he be squeamish and reach to Vomit, then we must give those things that promote Vomit freely, such as is Honey with Water, which makes a Man both Vomit and Purge. ¶ If Vomiting cannot be stopt (saith Sylvius de le Boë, l. 1. c. 15.) by reason of the plenty of humours that are in the body, and affect a passage upwards, nothing hinders us to give a gentle Vomit, those things being also added which may temper the humours, and in some measure appease and restrain their too much effervescency, as also upon urgent necessity Opiates in a small quantity. e. g. Take of Oxyfaccharum vomitivum 2 drachms, Laudanum opiatum half a grain, or a whole one, Mint Water what is sufficient. Mix them, make a draught.

IV. Things that restrain the violent motion of the Choler, Julapium Rosatum mixt with juice of sowre Pomegranates, Syrup of Quinces, Myrtle-berries, Enchir. med. Rosés and the like, must not be dissolved in water, Pract. lest the Coats of the Stomach be made more lax, which should after be strengthened and astringed, but they must be taken alone in a Spoon.

V. In diseases of this nature, wherewith preternatural evacuations are joined, Astriction is often attempted in vain, and not without great danger, before the abundance of excrement be voided; When therefore evacuation seems to have gone far enough, and strength is not much wasted (for some signs of debility may be born by reason of the Symptoms) we must neither stop nor provoke it, we may onely obviate other Symptoms: But if evacuation seem to have gone beyond the abundance of Excrement in the body, or beyond the strength of the faculty, we must stop it presently. But if the irritation, pain and anxiety be greater than the quantity of evacuation, and the evacuation less than the quantity of excrements, you must Purge, that when the abundance is plentifully evacuated, you may obviate the Symptome that consists in too much expulsion. And because the Symptome is urgent from the beginning, and because the irritation is never quite taken away in this disease, we must neither when we purge neglect the Symptome, nor when we stop, must we be forgetfull of the irritating juice: but we must mix something astringent with Purgatives, and something Absterging, or to take off the sharpness of the humours, with Astringents, or use them by turns.

Vallesius,
comm. in l.
5. Epid. p.
467.

VI. A moist Choler is a fierce and plenteous evacuation of bile upward and downward, proceeding from heat of the Stomach, which is stopt by cooling and astringent things, both taken inwardly, and applied especially by the use of Spaw-waters and Laudanum prudently given: We must abstain from hot Cordial and Stomach Powders, because they provoke and vellicate the Stomach. The Physicians of Paris bleed extremely, even when the Pulse fails, to avert the danger of a Gangrene from suffocation of heat in the Stomach.

Riolan. En-
chir. l. 2. c.
23.

VII. If there be fear that the Malignity hath dispersed itself beyond the first region of the body, for the better discussion of the impressed malignity, it is convenient to take inwardly Sweats with Alexitericks. But they must also have an astringent faculty, such as terra sigillata, burnt Hartshorn and prepared.

Sennertus,
Pract. l. 3. p.
1. Sect. 2. c.
13.

VIII. We must observe carefully, that if the Physician be not called till after the Patient be spent with Vomiting and going to Stool for some hours, may be ten or twelve together, and when his extreme parts begin already to be cold; I say, in this case, omitting all other remedies whatever, we ought to-rights to have recourse to the sacred anchor of this disease, I mean Laudanum, which must not onely be given while the Symptoms are urgent, but also when the Vomiting and Diarrhea are ceased, it must be repeated morning and evening

Sydenham,
de morb.
acut. p. 245.

ing every day, till the Patient have recovered his strength, and at length his health.

IX. I am taught, by sedulous application of my mind, and by manifold experience, that if on the one hand I should endeavour to expell these sharp humours, that are the fewel of the disease, by Catharticks, I should just doe as he that endeavours to quench fire with oil, seeing the operation of the most gentle Cathartick, would but give farther disturbance, and raise new tumults: And on the other hand, should I at the very first restrain the primary effort with Narcotick Medicines and other Astringents, whilst I hindered natural evacuation, and detained the humour against Nature; the Patient, his enemy being inclosed in his bowels, would undoubtedly be destroyed by an intestine War. For these reasons therefore I thought I must go the middle way, that I might partly evacuate, and partly dilute the humour. And by this method, found out and approved by me for several years last past, I have reduced this disease several times to good order. A young Chicken is boiled in about three Gallons of spring-water, so that the liquor hath scarce any relish of the Chick; The Patient is ordered to drink several large draughts of this a little warm, and at the same time a good quantity will serve for several Clysters to be given successively, untill, what upwards, and what downwards, all the broth be consumed, and given back again. So the Stomach being often loaded with a considerable quantity, and, as I may so say, turned, and the injection of Clysters being reiterated, the sharp humours are either turned out, or their acrimony being taken off, they are recalled to due temper. This washing-task being over, which takes up two or three hours time, some Paregorick Medicine puts a conclusion to the cure. I use this much; Take of *Coslip-water* 1 ounce, *Aqua mirabilis* 1 drachm, *Laudanum liquidum* 14 drops. Instead whereof any Shop Narcotick may be made use of. And this way that I have proposed, of diluting the humours, is much safer and more expedite than that is commonly taken to stop this most dangerous disease, either by evacuators or astringents, because by them the tumult is higher and fiercer, and all things are put in a hurly-burly: These on the contrary detain an enemy in the bowels, and, of a stranger, do plainly make him an inhabitant: To say nothing, how when the disease is protracted in length, besides the danger of its tarrying, whereby at length the bad humours creep into the mass of blood, and easily kindle a malignant Fever, the tedious trouble of a most grievous disease is created to the Patient.

X. In the 1654, before the Plague broke out at *Nismes*, the disease called *Cholera* raged very much, which killed many people in four days time: but they that took advice at the first onset of the disease, did almost all escape by this Method: When I conjectured the Patients had Vomited sufficiently, I gave them some aromatized soft Marmalade of Quinces, or simple Marmalade if the Fever were high, in a Spoon two hours before Supper, either keeping them from all manner of drink, or allowing them but very little, though they were tormented with unquenchable thirst; for drinking increases the Vomiting and Loosness, whereupon inevitable death follows: I helped the numbness and convulsion of the Legs with hot oil of Chamæmil: For the Vomiting and Loosness, I embroached the whole region of the Belly with oil of Nard, Mastick, Quinces, and I strewed thereupon Powder of Coriander, Mastick, &c. They also took an Electuary of Conserve of Roses, preserved Myrobalans, Powder of Pearl, Coral, Ivory, made up with Syrup of Corinths and Quinces. Sometime when strength was good, in the beginning of the disease, I gave Rheubarb in Substance, not omitting Cordial Epithemes. So they almost all recovered their health. In children that were emaciated with such a flux, or

a colliquative one, especially in Summer time, I persuaded them to use Clysters moist, made partly of strengthners, partly of restoratives.

XI. A Man Seventy years old was taken with a grievous Vomiting and Loosness, and in seven days he was cured with these four Remedies; A Clyster made of Milk, *Confectio Hyacinthi*, Conserve of Roses, and Yelks of Eggs; An astringent and strengthening fomentation of the stomach, with bags steeped in Red-wine; A Julep made of a decoction of *Plantain* and *Portlane*, with Syrup of Quinces and *Confectio hyacinthi*, given morning and evening; And *Laudanum*, one grain whereof was dissolved in his Julep every night. This cure at so great an Age was reckoned miraculous.

XII. A Nobleman upon drinking freely of ungratefull Wine, voided sincere bile upwards and downwards: He perfectly loathed all Meats, so that the very mention of bread and flesh turned his stomach. When I was called at length, seeing he had a great desire for some cooling Julep to quench his thirst, I gave him Spring-water corrected with *Vitriolate Syrup of Raspberries*: It was a most pleasant drink to him; but yet the fermentations that tormented the Stomach and Guts with a windy distension ceased not: An Emulsion was made of sweet Almonds, with a decoction of *Hartshorn* and *Scorzonera* root; and this pleased the palate, yet the fermentations, that were so troublesome, with their painfull distension, and the bilious Vomits and Stools thereupon were not stopt, although a strengthening Plaster were applied to the Stomach: And his restlessness toward the latter end of the day was so great, that I was forced to use *Laudanum*, two grains of which in Pills swallowed every evening gave him a quiet night, upon the return of day Vomiting of mere bile followed; yet he could bear it well: Then he drank a little strong Capon broth, and that he might quench his intolerable thirst with drink, a draught or two of his Emulsion was given him: Within an hour almost his restlessness returned with difficulty of breathing, which threatened Suffocation; for none could be more extreme: In the mean time the Patient desired a draught of simple water, I should easily have granted it him, considering he was in the flower of his age, and that his disease was choleric; but because the by-standers usually reckon this strange and destructive to the Stomach not accustomed to it, that I might satisfy both parties, I persuaded him to natural Water, but Medicinal, namely, the Wells at *Egra* in *Bohemia*: In the mean time that I might stop his longing, I commended those of *Silesia*: As soon as they came he presently quenched his thirst, and they did him good: When I visited him the next day, he told me he had rested well that night; he commended the Waters as gratefull both to his palate and Stomach; and there were some hopes that he began to recover; this hope continued, so that after dinner he could sleep a little. When eight days were over, he signified to me he was perfectly well, but that there remained some little effervescence of humours, and thirst: I sent him word he must continue the use of the Waters. After this method, but the attempt is bolder, the Inhabitants of the *Alps* in *Switzerland* are said to drink Ice in choleric Fevers, *Diarrhoeas* and *Dysenteries*. *Borellus* saith, cent. 2. observat. 27. that he cured a Woman onely by drinking fair Water, and applying *Ceratium Santalinum* to the region of the Stomach.

XIII. A Woman was taken with a Vomiting and Loosness in the Month of July about Noon, and before night she had twenty stools, with grievous pains about her Guts and Stomach, so that she was oppressed with Vomiting likewise, and voided much sharp and choleric humours: Being called in the evening, I advise my Patient to drink a glass of Vinegar and Water, till other Medicines were got ready; the operation of which was so effectual, that

that her Vomiting and Loosness were presently stopt, and no other remedies were used, because she said she was well.

Dom. Pan-
rolus, Pen-
tec. 2. obs. 11.

XIV. A certain Bricklayer, when he was but newly Married, went home every day at noon to his Wife from the Kiln, which was about 2 Miles; It so fell out about middle of Summer, while he was too vigorous in her Embraces, that he voided great plenty of blood upwards and downwards: for the heat and motion had opened the mouths of the Veins: nor would I call this disease by any other name, than a bloody *Cholera*: for besides his losing about twelve pounds of blood, there were other very bad Symptoms, namely, want of Pulse, with loss of strength, Hippocratical face, cold sweat, and he was in a dangerous condition: But by giving him four scruples of Bloudstone in Pomegranate-Wine, he was presently cured, to the great admiration of all men.

Riverius, pr.
l. 9. c. 11.

XV. When there is imminent danger from the violence of the pain, we must fly to Narcoticks, which when given prudently, are often attended with good effects: Some mix them with Purgatives, that both the pain may be asswaged, and the peccant matter carried off. *Forestus* commends this of *Elidæus*; Take of *Diaphen*, half an ounce, *Philonium Romanum* 2 Scruples, with either the Water, or decoction of *Chamæmil* make a Potion.

Septalius,
Animad.
vers. l. 7.
Sect. 23.

XVI. If there be a necessity of purging downwards, that is, when it moves imperfectly, and is cholerick, we must abstain altogether from *Manna*, and Medicines made up with Honey or Sugar; for they presently corrupt and turn to choler: But Whey will be the best remedy of all, or a Potion made with *Cassia*, which lays the heat, takes off sharpness, and purges gently: But if putrefied phlegm, or thick Choler cause it, nothing will be better than *Mel. Rosatum*, or *Solutivum* in Whey, or in an Infusion of Red Roses.

Medicines especially made use of by eminent Physicians.

Benedictus.

1. Among other things, Syrup of Mint with Pomegranate-Wine is highly commended, if the Pomegranates themselves with their inner pulp be put in the Press.

Forestus.

2. I gave one a little Cummin-seed powdered in Beer, then of the decoction of Barley 4 ounces, with Syrup of Infusion of Roses one ounce, a little Honey of Roses, strain it, and take it; then I anointed the whole part with oil of Dill and *Chamæmil*: By which means, without any other Remedy, he was cured to a Miracle.

Fr. Joel.

3. I have found no better remedy for this disease, than *Crocus Martis Paracelsi*. ¶ This also wonderfully stops a Vomiting and Loosness; Take of the Mud in the bottom of Smiths Troughs in which they quench their Iron, mix it with a little Vinegar, and apply it warm to the Stomach for a Cataplasm.

Langius.

4. Crystal is a most approved and excellent Remedy in a Vomiting and Loosness. Half a drachm of it may be given alone, or made up with other Medicines.

Mercatus.

5. Outwardly I find *Emplast. de crusta panis*, or Bread new-baked and dipt in Pomegranate juice, if it be timely applied, doth much good in a Vomiting and Loosness from a hot Cause.

Rolsinkius.

6. In strengthening the Stomach a decoction of Mint has great virtue.

Coeliaca Affectio, or Loosness.

(See Lienteria, Book 10.)

How it may be known and cured.

When too much is voided by Stool, considering the quantity that is eaten, seeing the useful part must necessarily also perish, we must consider whether the disease should be reckoned a Lientery, or a Coeliack Passion, or some other disease: for if food, a little after it is taken, be voided, and so there is a Lientery, because the stay of the food, and the necessary retention of it in the Stomach is hindered, through some fault in the Stomach; which is out of order, and presently excludes all it takes, it must either be strengthened, or freed of its troublesome Irritation, by Medicines that temper the humours, and if they abound, that may carry them off. But if the Food do make the necessary stay in the Stomach, be rightly and sufficiently fermented in it, and do make a pulsatious mass, which is voided such downwards, and if there be that sort of Coeliack passion, which I think may be called an *Idiocratic Loosness* (by reason of the defect of Secretion of the Chyle and Excrements, and that either through absence or sluggishness of the bile) that this evil may be cured, and the Loosness stopt, the said Secretion must be promoted and restored, and indeed by some bitter Aromatics, because they sharpen or augment bile, where it is either dull or too little, at least they serve instead of it, and so a disease bad enough, which kills its Patients by degrees, is cured. But if a pure pulsatious mass of fermented Aliment be not voided, but mixt and confused with the several Chyle swimming upon it, which is another sort of Coeliack Passion, because then the translocation of the Chyle into the lacteal veins, through the cloth-like crust of the Guts is hindered; whether it have its rise from phlegm stopping the Orifices of it, or it follow the consumption, and shaving, and the cicatrice stopping those passages, Medicines must be used, that may incite, absterge and purge this phlegm; for to remove the Cicatrice, and to repair the lost crust, is a thing denied to Art.

Rolincius,
meth. l. 5.

I. ONE Purge given with Judgment in the Colick, does that at once, which ten Clysters will scarce reach, especially in the Colick pain from obstruction of the excrement above the Valve. ¶ It was observed, when a Patient had had thirty Clysters given him, without any benefit, that another Physician gave him an ounce and half of Manna with two ounces of Oil of Sweet-almonds in some fat Chicken-broth, and eased the Patient of his pain.

Riverius.

II. Often when Clysters are given, they ascend not, because the passage is stoped by the tension made with wind: And it often happens, that when several Clysters have been given, they stay behind and almost suffocate: Therefore if one or two Clysters, or it may be a third, do not come away; it is better to recall them with a very sharp Suppository, than to distend the Belly with more Clysters.

Enchir. med.
pract.

III. The more unskillfull do err, while in a Colick coming of a vitreous matter, they prescribe Clysters of weak virtue and impropportionate, as such as are made of Oil of Chamæmil, Dill and Bay, with Hiera mixt with them: for they can onely doe some good in slight Colicks, in very violent ones they cannot take away the cause. The iterated in-

jection of these Clysters is not of such moment as to overcome the hostile humour: The indication of continual repetition is not taken from the action of the violent Indicant, but from its being there: Therefore a diminute repetition can never conquer any notable violence of the Indicant, because Violence and Presence differ *totò genere*. Stronger Clysters in the Colick passion, the most violent of all others, are made of *Decoctum Carminativum*, in which a drachm and a half of *Trochisci Albandal*, and an handful of the lesser Centaury are boiled, and some Oil of sweet Almonds, which may temper the Medicine. ¶ Mistress N. was taken with the Colick, a Clyster is given, which not working, I am called; I find her crying out for the grievousness of her Pain: I prescribe a Clyster of Emollient decoction, 1 pound, *Diaphenicum* 1 ounce, *Aqua benedicta* 4 ounces, wherewith her pain altogether ceased, and the Patient voided much phlegmatick matter and wind. I my self, being tormented with such a Pain, and being not much relieved by an emollient, carminative and loosning Clyster, I was cured by the like Clyster, so that as soon as it was given me, all the pain ceased, although it came not away till two hours after. ¶ Stronger Clysters must be given, nor need we fear attraction to the part, because the force of the Injection cannot reach far, nor attract the humours, for the obstruction of the Guts. What *Galen* said of making revulsion or aversion by a contrary way, it is said concerning inflammation, and not of other Diseases of the parts that have passages sufficiently open to make evacuation. ¶ *Castor* and *Euphorbium*, if the Pain persevere and stir not from its place, are very good for it, and is a present and the last Remedy; for they that take 6 grains of *Castor* in Wine, and drink a little after it, are quickly cured; *Euphorbium* also and other things are infused in the same quantity.

Sanctorius,
meth. viii.
err.

Riverius,
obs. 12.
cent. 2.

Rondeletius.

Idem.

Idem.

Idem.

IV. Gums are dangerous, because of their toughness, and must not be put in Clysters, for sometimes they stick, and cannot be forced back, and so kill, as it appeared to us by the Death of that Noble Person, Mr. *Gaudetti*, Governour of *Montpellier*: for the Apothecary would play the Physician, and without the knowledge of *Guilbertus*, *Griffus* and *Falcon*, who looked after him, gave him *Sagapenum*, Gum *Ammoniac*, and such things, dissolved; and after he had taken his Clyster, he died all of a sudden. ¶ *Turbit*, *Coloquintida* and *Agarick*, powdered, must be tied up in a rag, and so boiled.

V. If the Ail be above the Navel, Clysters doe little good, and as all Diseases of the Intestines are worse above the Navel than below, so when Clysters are given, while the Obstructions are in the upper parts, they come but a small way at the matter, and if they be often used, they bring these Inconveniences: 1. They dull the expulsive faculty, and bring it so to pass, as never to go to stool, unless provoked; 2. The sudden impulsion of the matter of the Clysters, if they be either too hot or cold, does hurt the temperature of the Intestines. 3. No Clyster can be given, but much Wind will be given with it. Yet when the Pain is very violent, and the humours crude, because we cannot then give Pills, we must of necessity come to the use of Clysters.

Crato, conf.
169.

VI. If milder Clysters are not easily returned, and loosen not the Belly, such things must be used as irritate more; and strain, and squeeze out the humours from the mouths of the Arteries: I have often known a Clyster doe a great deal of good, in which an ounce and a half of Turpentine has been put: The reason seems to be, because the balsamick particles of the Turpentine comfort the Intestines; and, moreover, are received by the venous blood, and being circulated with it through the whole Body, provoke Urine; so that oftentimes Urine plentifully follows such a Clyster, and always smells like a Violet. Perhaps also the Particles of the Turpentine, when they are every where diffused,

Willis.

fed, do move the stagnant morbidick matter, or else incline it, being fowre or otherwise degenerate, to a better temper.

VII. But as for *Fallopium*, *lib. de medicament. purgant. cap. 28.* his telling how *Rufus* condemns Clysters in the Gripes; for this reason, because they distend the Intestines more, and that he would have Suppositories used in their stead, &c. No Practitioners need much heed this Paradox: yet this Caution of *Rufus* may be admitted in some individual persons. So when the most excellent *D. N.* was taken with a violent Colick, and I was thinking to give him a Clyster of Penny-royal, Calamint, and such things, he confessed to me he could not bear the use of Clysters, because for the most part they increased his pains, and that on the contrary they were mitigated by a Suppository: yea, he said he observed that if at any time his pains were mitigated by using Clysters, yet they easily grew as bad again, and would never allow him above two or three days truce: but if a Suppository were given him, it did not onely, like an Incantment, appease the intolerable pains in the very time of the fit; but also by the use hereof he was preserved five or six months from all Gripes. I ask him whether he had the Receipt of the Suppository which he had used, or a Copy of it? And he communicated it to me. Take of raw Honey 1 ounce, Trochisci Alhandal half a drachm, distilled Oil of Wax half a scruple, Salt Gum 2 scruples; boil the Honey to a thickness, that it may be wrought with the fingers, add the Powders and Salt, and make Suppositories. And I thought good to mention these things for the sake of young Physicians, who will now and then call to mind that passage of *Hippocrates*, when Symptoms do not presently abate. When any man does all things according to right reason, and yet it succeeds not according to reason, he must not go to another thing, if that continue, which he saw at first. But some Candidate of Medicine may reply, if he be well read in the Greeks, especially in *Hippocrates* and *Trallianus*, and he may prove from these Authours, that not onely Clysters, but Wind it self artificially put into the Bowels doth mitigate the Pain and Gripes; yea, save those that are in danger of their life. Whence he may infer either against *Rufus* or *Fallopium*, that this fear of Clysters is vain, and so the Paradox utterly falls to the ground, which maintains that, Because Clysters distend the Guts, therefore Clysters must not be used in the Gripes: And two remarkable Texts occur in *Hippocrates*, the first is in *lib. 3. de morb. sect. 5.* In which place he treats on purpose concerning the Cure of the Gripes; and many Remedies are produced against it, where among the rest he gives this advice; But if (saith he) it refuse, a great deal of Wind must be got in, by a Pipe tied to the nozle of a pair of Bellows, and blown into, and then let it distend both the Belly, and the Gut that is contracted; then, after you have drawn out the Bellows, give a Clyster. The latter Text very like the former, *lib. de affect. sect. 5.* is this; But if he refuse a Clyster, a Pipe being tied to the nozle of a pair of Bellows, and blown into, much Wind must be got in, the Gut and the Belly being distended by Wind; when the Pipe is drawn out, a Clyster must be injected immediately, which if he receive, he will go to stool; and recover. *Trallianus* also, *lib. 5. cap. 10.* is of the same opinion concerning persons sick of the Colick, that are pained with obstruction of hard excrement, and uses the same Remedies which *Hippocrates* prescribes, who there teaches us the way and manner of operation far more clearly than *Hippocrates*, by means whereof, with a Smith's Bellows, Wind may be got into the anus, and at such a time, when Antidotes taken at the mouth and Clysters could doe no great matters. Truly, to him that objects these and the like things out of *Hippocrates*, we must give an Answer from *Hippocrates* himself, who, *1. aph. 6.* saith, that for extreme Diseases, the most absolutely extreme Cure does excellently. Which words I take in this sense, that not acute onely, but the most acute and altogether mortal

Diseases must be understood by Extreme, or as *Galen* speaks, Highest, or beyond which there are no other; and among these the Iliack passion or Twisting of the Guts, a sort of that Passion, may be reckoned. See *Hofman* about this opinion, *Institut. lib. 3. cap. 47.* As if *Hippocrates* should have said, The Twisting of the Guts is a desperate and extreme Disease, you will therefore doe your Patient right, if you delay not the extreme cure, but urge it, or as *Galen*, *5. m. m. 15.* venture it. An excellent practical Admonition: Who, when the Patient must dye, thinks it a most absurd thing to begin with gentle means. Therefore far be it from us to charge *Hippocrates* with Ignorance, as if he knew not either those Inconveniences that attend both a flatulent or pneumatick Clyster, and the thrusting of a Smith's Bellows into the anus, or those, that *Fallopium* and *Rufus* fear will be brought on Patients by all Clysters: But, on the contrary, it must be asserted, that *Hippocrates* well knew all these things, but advised, that of two Evils, the Patient being in danger of his Life, the less should be chosen, and that in this case a doubtful Remedy was better than none at all: As a pneumatick Clyster, or a Blast of the Bellows were indeed hurtfull to the Intestines, inasmuch (as *Rufus* observes) as thereby the Guts were more distended, prickt and racked; but this was but for a moment, and so as the Distention of the Intestines quickened the torpid Belly, and parted the guts from the excrements that stuck close to them, which Nature was afterward able to void.

VIII. When the Disease invades one, these three things usually concur. 1. Obstruction of the Belly, through plenty of dry excrement. 2. Driness of the Guts, with which the obstruction and heat of the Kidneys, which maintains the Driness, often coincide: Sometimes too much Purging leaves the passage dry, especially when thin matter is purged, and the thick left. 3. Afflux of humours from the Veins increases Wind: In this state of affairs, when the Colon being obstructed above by the humours, below by the excrements, Wind can neither get out openly, nor for its thickness transpire by occult ways, that miserable Distention of the Intestines ariseth, especially if the Guts be also dry: Here some presently hasten to discuss Wind, they apply Fomentations, give Discutients, &c. which indeed in a slight Colick doe what they ought; but in a violent one they doe a great deal of harm, by dissolving Phlegm into Wind. These things have their use, but it is necessary first of all, that the lower passages be opened, and the Driness of the Intestines amended. For this purpose lenient, and mollient Clysters are very good, and if there be viscid matter, inciding also and absterging ones are proper; upon which we must insist, untill the Obstruction arisen from the Retention of excrement be taken away. And why Oils should not be received in Clysters, I see no reason, for they make slippery and mollifie the Guts. I fear Driness much more, which, if Oils are not used, remains. A certain woman, when she was ready to dye of colick Pains, was cured onely by mollifying the Intestines. I put the Sewet of a Wether taken out hot in a Kettle, and before I could get it ready I applied a Cupping-glass, endeavouring thereby to ease her pain, the Intestines being mollified, she voided much vitreous phlegm and bilious humours, and she recovered, contrary to all expectation. Hence it appears of what moment the mollifying of the Intestines is, in the Colick; for which purpose Oils are given: *Galen*, when his Guts were pricked as with a Piercer, upon taking a Clyster of Oil of Rue, voided a quantity of vitreous Phlegm, and recovered.

IX. *Bartholinus*, *cent. 4. epist. 92.* saith, the most present help must be placed in Clysters of Tobacco Smoaks. What they are able to doe, *Mr. Pacinus*, that most able Apothecary, found at *Geneva* not many years since; who being grievously sick of the Colick

S. Pauli,
Quadrupart.
Botan. p. 461.

G. Hofman-
nus apud
Scotiaum,
conf. 273.

Colick from the *Colon's* being obstructed with excrements, when he could not have a stool by any means, no not by swallowing of Bullets, one of Lead, another of Gold, nor by three ounces of Quicksilver it self, was cured by having Tobacco Smoak blown into his anus by a common Tobacco-pipe, which gave him a large stool, and by other convenient Remedies.

X. They deserve reprehension, who in a Colick caused by hard excrements, do presently use sharp Clysters, and hot Fomentations and Ointments, all which things do but stop up and dry the more; for *Galen* teaches that we must first go to Emollients, and then to sharp Evacuations. I, happening upon a Patient whose Belly was stopp'd up with hard excrement, and was in great Pain, gave him first ten ounces of Oil of Sweet-almonds, and the next day ordered him a Clyster of Oil and *Hiera*. Whereupon the excrements dissolved by the Oil, were brought away by virtue of the *Hiera*. In such a Colick I have eased many of grievous Pain, giving them in twenty four hours time thirty ounces of Oil of Sweet-almonds, ten in the morning, other ten in the evening without drink, and ten the next morning. This quantity of Oil certainly comes to the place grieved, and greases all the Guts: I give no other food in the mean time, because Oil nourisheth sufficiently. A less quantity is insufficient.

Sanctorius.
Meth. l. 3.
c. 9.

XI. A Noble woman was taken with a grievous pain of the Colick, and, nothing else being at hand, I ordered her a Clyster of *Hippocras* wine, and she was presently cured. A Farmer, that had bought Wine spiced to make merry withall, was so cured. Now these Wines have Sugar or Honey for deterioration: And *Hippocras* has Cinnamon, Pepper, Ginger, Grains of Paradise in it; therefore no wonder, if People be cured by such Remedies. I cured another Country-fellow with Broth, Garlick beaten in a Mortar and Oil: for whatever things incide and attenuate, do discuss, and therefore cure; as a Decoction of *Erysimum*, wherewith I have cured several, which also is an effectual Remedy in Wine. In these Clysters Wine should never be omitted, because it concocts the matter, eases pain by discussing Wind, and by refreshing a little: But then it must be old and of thin parts.

Rondeletius.

XII. Sometimes strong Purges, I think, are necessary: For these two things are commonly joined together, Pain and Costiveness, so that neither strong Clysters nor Lenitives, although taken in great plenty, can give a stool: Therefore what must be done then? Must we tarry till the Guts be twisted? If in the Twisting of the Guts, in which the strength is lower, no Man refuses a Purge, why then should not Purges be prescribed, that the Patients may be preserved from it? They that think we must not purge, as *Fuchsius*, say that *Galen* wrote, how the humours must never be drawn to the part affected, but this is of no moment, because there is a way in the part by which the attracted humours may be voided. *Fuchsius* adds, that neither *Paulus* nor *Aetius* used any other Medicines than gentle ones, and that the Moderns have introduced the use of Purges: But he is deceived, because perchance he onely read the Judgment of *Paulus* and *Aetius* concerning hot matter, and not cold: For *Paulus*, speaking of cold matter, proposes Pills made of *Euphorbium* and Scammony: *Aetius* in the same case commends *Hiera Archigenis*: Whereas he subjoins, this custome was received from Practical Physicians, he shews that either he never read the *Arabians*, or but carelessly, who use *Diaphenicon*, *Elect. Ind. Hieræ magna*, strong Pills. And I must ingenuously confess I have cured several in one day with this Medicine; Take of *Diaphenicon* half an ounce, Species *Hieræ* 3 drachms. Mix them; Make a Bolus.

Saxonia.

XIII. If Catharticks cannot be kept for continual Vomiting; apply a large Cupping-glass to the Navel, or a little below, and there let it stick for an hour,

if it can be done; or let the Cathartick be taken in the Bath, for by this means it will stay.

Enchir. med.
pract.

XIV. *Avicenna*, *fen. 1. doct. 4. c. 1.* says, that the Colick sometimes comes by reason the passage of the bile to the Guts is stopp'd; therefore the expulsive faculty of the Intestines is not irritated, and by consequence the excrements are retained, and by continuance hardened: And because the *Colon* is the greatest and weakest of all the Guts, it gathers a great quantity of excrements, and after it is stuff'd and full loaden, intense pain is bred, which is not removed with purging Medicines, because they draw new matter, whereupon there is a greater load of matter, and therefore greater pain: Neither is it removed by *Hiera*, or other drying things, because so the excrements are more dried and hardened; Nor is it removed by Clysters, because the *Colon* is shut: But we must then rely wholly upon Oil of Sweet-almonds; about half a pound of it may be taken at the mouth.

Sanctorius.
Meth. l. 3.
c. 9.

XV. Too violent Catharticks must be avoided; as Hellebore and Antimony. Nor yet is *Cassa*, though it purge gently, proper, because it is windy. *¶* Manna is windy, I do not approve of it in the Colick. Do not give Manna, Rheubarb or Senna, especially in Potions, except the Intestines be first well strengthened. *¶* If it be from Phlegm, it must first be purged, that Flatulencies, which usually accompany it, may be digested: Among Purgatives, *Agarick*, *Mechoacan*, or *Elect. Diacarth.* may be given in a Decoction, with Anise, Fenil, or *Daucus*-seed. We must avoid Rheubarb and Myrobalans, also Senna and *Cassa*; the first, because they bind; the latter, because they breed Wind.

Hartman.
Prax. c. 146
sect. 11.

XVI. What Purgatives are convenient for a bilious Colick? When the Pain is a little mitigated, an Infusion of Rheubarb in Cichory-water may be given with Syrup of Roses, and must be frequently repeated, till the load of humours be evacuated. If such a gentle Purge be not sufficient to root out the Disease, we must fly to *Mercurius Dulcis*, which given several times with diagrydiate Purges, performs the Cure. They that suspect *Diagrydium*, may take *Mercurius Dulcis* alone made into Pills with some Conserve of Roses, drinking upon it an Infusion of Senna and Rheubarb, with Manna and Syrup of Roses.

Riverius.

XVII. *Eletharium Diaphanicon* is excellent for the Colick; for it purges tough and thick Phlegm: but it must be made of ripe Dates, which have attraction enough to correct the Scammony: for from *Galen*, *l. ad Glauconem*, Wormwood, that is hot and dry, is not good in phlegmatick Diseases, because of binding: For the same reason they must be steeped in Wine rather than Vinegar.

Rondeletius.

XVIII. If we have a mind to mix Narcoticks with Purgatives, by this method of Cure we gain three things; we purge Phlegm it self, we discuss Wind, and we ease Pain; than which no more proper or successfull way of Cure can be thought on in these grievous Pains.

Ficinus, Phy.
Ingr. c. 19.

XIX. Sometimes it happens that Phlegm gathered in the *Colon*, causes a Swelling, which being turgid on the out side, leads the Physicians into an error, and eludes the Cure: for when they find the hardness of the Swelling, they presently run to Emollients, and insist upon them, when the Cure should be directed to the taking away of the cause, i. e. the carrying off the Phlegm from the Guts. And the thing it self speaks; for when part of the Phlegm is voided, the Swelling falls and grows less. See *Fernelius* his History of *Charles* the Fifth his Embassador.

G. Hofmannus, conf. 6.

XX. A Vomit, if it be convenient, must never be omitted in this case, by which the Ejectories of the Bowels being emptied, they may more freely receive the recrements of the blood and nervous liquor, which would otherwise increase the morbid matter. Moreover the *Plexus nervi*, and all the parts would be so shaken, as nothing that can fo-

Willis.

ment the Disease, would be suffered to stagnate or gather there. ¶ The Reverend N. was subject to the most violent Colick, being convulsed in his hands, when he had been often purged by things taken at the mouth and by Clysters, and nevertheless his Pain returned, with a violent Compression of the Abdomen, I thence conjectured that store of gross humours was lodged in the Hypochondria, which must cause such straitness, and his relapse; I betook me to a Vomit, I gave him of *Diasarum Fernelii* three drachms, with four ounces of *Hydromel*, to make revulsion of the matter by Vomit; within less than an hours time he began to vomit, not continually, but by turns: Great store of phlegmatick humours was cast up, more than a Basin full; at length, the sink being cleansed, the Vomit ceased, nor did his Pain return any more; the Patient, who before was lean, now growing fat. Many Monks every where in their Cells, labouring of a compressive Colick, their Bellies being drawn-inwards with violence, which at length ends in Convulsions and Epilepsies, go down to their grave, who if they had taken Vomits might have been kept alive: because these gross and tough humours, being close fastned, can no other way be rooted out more conveniently. But, because Vomits frighten the By-standers, and make the Physicians also more timorous, they are therefore the seldomer used.

Aug. Thane-
rus, Obs. 3.
l. 6.

XXI. When we see a Clyster will doe little good, we must go to Potions and outward Applications. A Potion may be made, 1. An easie one of *Diacyminum*, or *Electuarium de bacis lauri* with strong Wine hot, or strong Wine and Honey. 2. Of Nutmeg powdered and *Cretian* Wine hot. 3. Of Cassia 1 drachm, with Wine also. 4. A Turpentine Potion. 5. Salt and sulphureous Waters. 6. Wolf's Dung which hangs on Thorns. 7. Larks in White-broth. 8. Hart's-horn burnt in a Pot, reduced to powder, and drunk in a drachm weight. 9. Broth of an old Cock with *Caribannum*, Polypodies, Turbith, Hyssop, Seed of *Daucus*, Dill and *Ammi*, *Sal Gennm.* and Spices boiled in it, giving a Clyster now and then of the same Decoction. When the matter is concocted and ready, I have used *Diaphenicon* and *Diacatholicon* with good success, and sometimes Cock-broth, and other Remedies which do not heat much.

Leon. Jac-
chinus.

XXII. Give Syrups, without any Liqueur, *Ozymel simplex* or *compositum*, mixing some *Scylliticum*, Syrup of Betony and Mint with it: for if you mix any hot Liqueurs with it, they will encrease Wind.

Saxonia.

XXIII. Seeing the antecedent Cause is either thick and phlegmatick humours lodging within the Membranes of the Colon; or some flatulent matter; or an Inflammation of the Colon, or a sharp and biting Juice, which causes sometimes are complicated, if the Disease be of any continuance, when frequently, together with the thickness of the matter, a flatulent acrimony is also joined with Inflammation; wherefore, according to the Hermeticks, the colical disposition is produced from a tartarous Mucilage, mixt with styptic and sower Spirits: Therefore it is asserted, when all things convenient are premised, that Spirit of Salt is very good, as well because by its attenuating and resolving faculty it corrects the peccant humours: as because by its discent faculty it digests the flatulent matter: Besides, it alters the putrefying matter, and preserves the humours from Putrefaction: Yea, by its aperient faculty it disposes the morbid cause, that nature may sooner rid her self of it: And in as much as it depresses or fixes hot and sulphureous Exhalations, so far it is a very good Anodyne. Nor need we fear, that by its heat it will too much melt and dissolve the humours, which *Galen*, 2. *Metb.* 8. bids us have a care of; or that by its penetrative faculty it should enrage the humours more; because it is evident, in that being give to hydro-pick persons, it quenches thirst, and does not cause it; and it rather consumes and allwages the raging humours, than irritates them.

Horst-
Dec. 6.
l. 1.

XXIV. Be not inconsiderately of their opinion, that Cure every Colick with hot things; Look attentively to the Cause of the Disease before you. I saw yellow Choler swimming so plentifully on the Colon of a Woman, that one might have taken it thence with a Spoon, which affluence of Bile in this place seeing Anatomists do frequently observe, it is very likely that it sweats through the coats of the Gall-bladder by little and little, being nearer to this Gut than others. Wherefore they doe very ill, who by overmuch study do violently press the Liver, because this prone incurvation of the bended body squeezes out the Bile; which sometimes as it pricks and vellicates the out Skin, so now and then it insinuates it self between the coats of the Colon, so miserably racking the Patient thus beset, that he had rather dye a thousand deaths, than fall into such misery.

Tulpius,
obs. l. 2. c. 37.

XXV. The chief signs of a Colick arising from Phlegm and Wind are taken from the excrements, and for the ease and cure of it, things that purge Phlegm and break Wind, all hot things with tenuity of parts are used. Yet, that we should have more respect to the temperature of the Body and the Age, than to these Causes, i. e. Phlegm and Wind, this fresh example doth shew; About two years since, that Noble Person, Mr. de Momolin, Treasurer to the most Serene Prince de Longeville, in the Province of *Neuschassel*, scragged, as it seems, of a cold and dry temper, endowed in his youth with a senile prudence, about thirty five years old, was frequently taken with the Colick, which gave him but little respite, so that he was scarce two days free from it. He advised with several Physicians, whose main care was, that the crude, cold and moist humour might be altered, concocted and excluded, Wind dissipated, the cold intemperature of the Stomach and Guts might be brought to a hotter, and their tone might be restored them. This Noble Person diligently observed the Diet and Medicines, nor failed in any thing, the Pain nevertheless raging, and nothing abated. At that time he was sent Embassadour by the most Serene Prince to his Subjects, with the Noble *Akasia* for his Companion, who is Grandchild to *Akasia* the famous Physician of *Paris*, well known for his several Commentaries upon some Books of *Galen*: He, considering the constitution of the Noble Treasurer's body, judged he must go another and contrary course; he said the Disease must be overcome not by heating and drying things, but by temperate and moistning, and that the generation of Phlegm and Wind, was the product as well of a hot and dry intemperature of the Guts, as of a Cold: If he had a mind to be free of his troublesome and frequent Pain, he must bid farewell to the Remedies he had hitherto used, and must now ply temperate onely and allwaging things: That for this purpose the continual use of Chicken or Veal-broth without Salt, was very good, that he should either wholly abstain from Wine, or drink it with much Water. The Noble Treasurer had scarce observed it three days, but he was free from all pain, and enjoyed his perfect health.

XXVI. An Apothecary forty years old told me he was several years troubled with the Colick, and could find no other Remedy but Drinking of Water, and as long as he persevered in it, he continued well, but as often as he fell to the use of Wine again, within two days he was taken with the same disease. In my judgment the Colick was not raised by simple bile, but for the greater part by a Melancholick Humour mixt with a bilious one, seeing the said Apothecary had the melancholick temper predominant in him: And seeing Melancholy is continually poured out of the Spleen into the Stomach, which by its acidity infects the Wine as soon as it is drunk, the Wine presently turns sower upon the Stomach, and encreases the cause of the disease. But if a bilious humour were the cause of the Dis-
ease,

ease, it might indeed be corrected by drinking water; but the use of Wine would not so suddenly bring the disease; because Wine does not so quickly produce the Qualities of Bile, as of Melancholy, in as much as wine easily grows sower, and not bitter: And that which makes me the more believe it is, that when the said Apothecary was taken with a fit of the Colick, he cast up sower stuff by vomit, and not bitter.

XXVII. A certain Physician, as *Paulus*, l. 3. c. 42. and *Avicenna* relate, cured bastard Colicks, which formerly ended in the falling-sickness and Palsie, several times with Diet potentially and actually cold, although irrationally. Which nevertheless *Oethaus* in *Observat.* testifies, did happily succeed the plentiful use of raw Plumbs and Grapes. ¶ And it is convenient sometimes by the repeated drinking of warm water, sometimes, when the body is prepared, of cold water, to keep in the Choler that flies upward: Or some water, in which new vine Branches, pregnant with their native juice, chopt indifferently small, is boiled in *Balneo Maris*. ¶ *Galen*, 12 *Metb.* 7. cured a certain Patient of the Colick in Summer time, when he was very thirsty, onely by drinking cold water, to whom *Ætius* also subscribes. After whose example, when I practised Physick at *Venice*, I often gave cold water in the Colick with good success. ¶ Some according to *Julius Alexandrinus* his advice, dislike not of applying cold water to the Belly with double cloths, in great extremity: For it is manifest that by the use of it the pain presently abates: which nevertheless, except timely hindered, usually turns to the Palsie, the matter being violently repelled, and driven to the origination of the Nerves. ¶ *Taranta* and *Crato*, famous men, account cold water plentifully poured upon the belly as a secret: which yet they had from *Hippocrates*, 5 *aph.* 25. for cold water being poured largely on, a numbness being caused, takes away the pain. ¶ But this may be done with more safety, when the body is loose, and when the excrements are loosened and evacuated.

XXVIII. Seeing all the Phænomena of a bilious Colick do manifestly declare, that this disease comes either from some sharp humour, or vapour, discharged from the mass of blood upon the Guts, The primary curative Indication to me is this, *scil.* that the said humour, as well the Antecedent in the veins, as the Continent shut up in the Bowels, may be evacuated: The second is, that by the use of Anodynes the violence of the humours tending thither may be stoppt, and the most sharp humour may be qualified: Therefore I order a good quantity of blood to be taken away (if namely it have not been done before) and an Anodyne to be given within three or four hours. The next day I prescribe some gentle purge, to be repeated the next day but one, sometimes for three turns, as I find the reliques of the humours more or less.

XXIX. But it must be observed, that if this disease owe its original either to horary fruits eaten in too great a quantity, or to any other meat hard of concoction, from whence bad and corrupt juices were first of all transmitted to the blood, and from it afterwards to the Bowels; The case I say, standing thus, the Stomach must first of all be well washed by drinking a great quantity of Posset-drink, and vomiting it up again, which done, an Anodyne must be given: and the next day a vein must first be opened, and for the rest, we must proceed in the same order, as we have already shewn.

XXX. But seeing the violence of the pain, and inclinations to vomit, whereby the Intestines are in a manner inclined to an inverted motion, do resist the Operation of Catharticks, their strength must be increased, nor must a Lion be set upon a Cock: for you will but in vain give a gentle purge, unless perhaps the Patient be very easie to work upon, which must diligently be enquired: for when such a Medi-

cine is not able to make its way through the Canal of the Guts, the Patient is rather hurt by it, while the vomit and pain are increased by its ineffectual motion. A gentle purging Potion of infusion of Tamarinds, Senna and Rheubarb, in which Manna and Syrup of Roses may be dissolved, is to be preferred before any other Purge, because it gives the humours the less disturbance: Yet since either through the Patient's averseness to a Medicine in a liquid form, or his inclination to vomit, he cannot retain it in his Stomach; Pills must of necessity be made use of, among which *Cochia* ever pleased me above the rest, because they are sure to go the same way they begin, both in this case, and in most others.

XXXI. But when either the weakness of the Stomach, or inclination to vomit is such, that Pills cannot be kept, there I first of all order an Anodyne, and within a few hours after a purge, yet allowing so much time, as that the Purge may be given at such a distance, that it may not be overcome and perish by it, and may make a convenient stay in the Stomach, which may suffice till the purge begin to work, and that when one ceases, the other may begin its operation: Although a Purge, if it can be so, should be given by right a good while after the Anodyne, because twelve hours after the Anodyne is taken, it will scarce work, and not without much difficulty.

XXXII. But seeing here, as in most other diseases, in which Narcoticks are indicated, a purge always increases the pain (at least when the working is over, for while it works the Patient sometimes finds himself more at ease,) therefore it is customary with me, to give an Anodyne, as soon as the Energy of the Purge is over. Which I also order to be taken every day morning and evening between his purgings, that I may be sure to lay the Pain till he have purged sufficiently.

XXXIII. When purging is done withall, I endeavour (which is the onely thing now remaining to be done) to bridle the violence of the Humours by giving an Anodyne constantly morning and evening, which sometimes must be repeated oftner: Nor has it ever been my fortune to be able to lay violent pains, except by a larger and reiterated dose: For what is sufficient to subdue another evil is overcome by this, the violence of the pain breaking the virtue of the remedy. And when pain of this nature is urgent, Narcoticks may very safely be repeated, but not when it is over; wherefore following the direction of Pain, I repeat the Narcotick, till it either quite cease, or be very much abated: Interposing nevertheless so much time, as that it may be apparent to me, what I may expect from the precedent dose, before I give another: But for the most part, unless when the pain is extraordinary violent, a Paregorick given morning and evening will be sufficient. The Anodyne I use most is *Laudanum liquidum*, of which this is a description. Take of *Canary Wine* 1 pound, *Opium* 2 ounces, *Saffron powdered* 1 ounce, *Cinnamon* and *Cloves* each 1 drachm; Let them be infused in *Balneo Mariæ* for two or three days, till the *Liquor* acquire a due consistency; sixteen drops of it may be dissolved in some distilled cordial Water, or the dose may be increased, according to the violence of the Pain.

XXXIV. This most simple method, whereby the peccant humour is evacuated by Bloudletting and Purging, and afterwards Rest is procured by means of Narcoticks, always succeeded most happily with me, above all others, that I have hitherto known. For carminative Clysters, that are given on purpose to get out the sharp humours, onely make the matter worse, and when a tumult is raised in the humours, make the disease the longer. And here I would have it taken notice of, that although I said Bloudletting and Purging must necessarily go before this appeasing Method; sometimes nevertheless, the case so requiring it, omitting both these, we must

Idem, p. 297.

Idem.

Idem.

must begin the course with Paregoricks, for example; when for some former sickness large evacuations have been made not long before the coming of the Colick, (for frequently by reason of the weakness of the bowels, especially if there be an accession of a higher degree of heat from Wine, or any other Spirituous Liquor drunk immediately, they that are lately recovered of another Disease, fall into this,) in this case, I say, I think it not onely unnecessary, but hurtfull also, by giving more purges to raise new tumults, and again to disturb all anew. To say nothing, how in this disease the Patient for the most part, before he sends for a Physician, washes his Guts sufficiently by the repeated use of Clysters, so that partly for this reason, partly for the long continuance of the disease, Narcoticks in a manner onely seem proper to be used.

Idem.

XXXV. And because this pain is more naturally apt to relapse than any other, all opportunity of its return must be taken away, by giving an Anodyne twice a day for several days together. But if when the Narcotick is left off the pain now and then return, (as sometimes it does) nothing yet could be invented by me, that so certainly conducted to cure the Patient, as riding on Horseback or in a Coach, the Anodyne in the mean time being given morning and evening. For by such exercise the matter causing the disease is drawn into the Habit of the Body, the blood being divided into its minute parts by stirring, is as it were purified anew, and at length the Intestines themselves, by stirring up of the innate heat, are not a little strengthened and cherished. Nor am I ashamed to confess, that I have more than once perfectly cured this disease by such exercise, when I have not been able to do it any other way. But neither must this be tried, till after sufficient evacuation, nor must it be left off till several days afterwards. And, to speak the very truth, I have observed this kind of Exercise doe much good not in this case onely, but in all Chronical diseases, if a man constantly persisted in it. For if we reckon with our selves, how the lower Belly, wherein the Organs of Secretion are placed, is especially shaken by this exercise, and that they are shaken with some thousand Trottings in one day, we may easily think that by the help of the said exercise, they can discharge any recrementitious juice, that is settled there, and (which is yet of more moment) that by such strong excitation of the innate Heat they are strengthened, so as to perform the office of depurating the blood aright, which Nature has committed to them.

Idem.

XXXVI. It is manifest from Observation, that when this Disease being unskillfully handled hath tired one out for a long time, so that the bowels languish, the Patient is worn to skin and bone, and ready to dye of faintness; In this case, I say, the more liberal use of *Aqua Epidemica*, or *Mirabilis*, or any such like which in his health he liked best, at this time helped him beyond expectation: For by help of this the few adust reliques of the innate heat and Spirits were excited, and the preternatural ferment, sticking to the bowels, and now and then administering fewel to new Paroxysms, was extinguished by the more spirituous Liquors.

Idem.

XXXVII. Moreover as in the cure of the Disease, so also when it is cured, a thin Diet must yet for some time be continued: For seeing this disease affects a Relapse above all others, and that it chules to its self the chief Instruments of Concoction (I mean the Bowels now weakened by it) the very least error of this kind will presently bring considerable damage. Wherefore as well in this as in all other affections of the Bowels, Meats hard of Concoction must be avoided more than a Toad, and what light meats are allowed, must be taken onely in such a quantity as may keep Life and Soul together.

Idem.

XXXVIII. When Anodynes doe no good, and the pain is exceeding violent, we must come to Narcoticks, which are very commodiously used in a biting and a sharp humour, not because they cool, as is commonly believed, but because they have the faculty to mitigate the acrimony of the humour, to thicken it, and to keep in its biting and motion. But in cold, thick and tough humours Opiates are not so proper, seeing they make the morbidick cause worse, and more difficult to cure. And though they that have the Colick from cold humours, do at first perceive some benefit by them, yet afterwards the pains become greater, the humour it self being made thicker, and more unfit for motion, and so it sticks more closely to the Coats of the Intestines.

Sennertus.

XXXIX. Yet you must take this caution about the use of Narcoticks, that when there is occasion for them, they be used while there is yet strength; for if they be used when strength is wasted, and the Patient is near death, they will not onely doe no good, but also hasten the Patient's end, and take away Life and Sense together. Then let such things be given in a Clyster in some convenient decoction, and when the Clyster is given, let the Patient lie on his pained side.

Idem.

XL. But if the violence of the pain rise so high, that leaving other intentions, we must have an eye upon it, it will be proper to use Narcoticks, which by stupefying may correct the evil, both taken inwards, and outwardly applied: Yet with due Provision always, as to their quantity, manner of using, time, and the subject to which they must be administered. What are given into the Body, are mixt with Purges, Potions, Clysters; But it is convenient, they have all of them these requisites. 1. That by hastening to some principal Part, they weaken not its faculty. 2. That they be well corrected. 3. That they strengthen the Spirits, and be mixt with strengtheners of all the vital Faculties, hepatick and stomachick: For there must be no other end in these things than refreshing the strength, to wit, that while the Pain ceases, the Patients may recollect their strength, be a match for the Disease, and be able to subsist the time of cure: Therefore it is better to give them twice or thrice in a small quantity, than in so large a dose as may afterwards doe harm. But when the pain is laid, and watching hushed, they must presently be removed, lest they serve to promote the morbidick cause.

Martini de Morbis mentis.

XLI. We must have a special care in the mean time that Opiates be not given, unless the body be first purged by proper evacuations, and they must be taken some hours before Meal, upon an empty Stomach, in extreme pain, and when other Anodynes will doe no good.

Ficinus, Phys. Jogr. c. 19.

XLII. The cure must be begun with Clysters; Take of the Decoction of Mallows, Mercury, Pellitory of the Wall, Chamemil flowers, Betes, 1 pound, Honey of Roses solutive, Oil of Chamemil, each 3 ounces, Yolks of Eggs No. ij. mix them without salt. If evacuation do not follow, let another be repeated of the Oils alone, which the Patient must keep all night. But if no evacuation of Excrements follow, some Lenient should be given: But because I have seen many Lenitives given often to no purpose. I propose as a very safe Medicine, and often tried by me, 5 ounces of fat Manna dissolved in Broth, altered with Cinnamon: for by its fatness, moistness, and subtilty of parts, it makes lax, penetrates, and by softning expells the Excrements; which if it give not a stool, Oil of sweet Almonds may be given from ounces to a whole pound. When the Gut is rid of the Excrements, tough phlegm must be prepared with *Mel rosar. simpl.* and *Oxymel*, adding a little *Aqua vita*, Aniseed, Juniper or Cinnamon water. And being prepared, it must be evacuated with 2 drachms of *Hiera picra Galeni*, made up with Lenitive Eleatuary. But if in the mean time the belly become bound again, such a Medicine may be given; Take of Elect. Diaphenic.

Portia, 2a. c. 11.

Idem, 1a.

Sennertus.

Idem.

Sennertus de Morbis mentis, 1. c. 14. Soli, 1a.

Idem, 1a.

phœnic. half an ounce, Spec. Hier. simpl. 2 drachms, Philon. Roman. half a drachm; mix them, make a Bolus. For when the pain is eased, the Intestines are more easily loosened, and the Excrements voided. But if the Disease continue, preparation must be repeated in this manner: Take of the Decoction of Speedwell, commended by Crato, of green Mint, by Ætius, root of Masterwort, 5 ounces, Oil of Zedoary 5 drops; make a Syrup of them. For Zedoary is most powerfull against vitreous Phlegm. Then purging must be repeated with stronger things, whatever *Massaria* and *Septalius* say; for we may use them when the pain is a little laid, the matter diminished, and sufficiently prepared. Wherefore *Essentia Trochisc.* *Albandal*, or *Spiritus vite aureus Rulandi* may be given; which if they be not at hand, Take of *Elect.* *Diaphoen.* 2 drachms, *Pil.* *Aloephang.* 1 drachm, *Trochisc.* *Albandal*, *Castor* each 3 grains; make them up.

Fortis, conf.
92. cent. 2.

XLIII. If perhaps after all is done, the Disease should return, the Cure may be twofold, Forced, to wit, and Regular; The forced is proper for most cruel pains, and must be performed by Anodynes and Narcoticks; wherefore *Galen* 12. met. 1. says, Though I above all men do abhor the use of high Narcoticks, yet I give them in a very violent Colick. Which he repeats 3 per loca 1. When pain is urgent, I of necessity use stupefiers. To which nevertheless we must not come, till after we have used other Medicines in vain: For they ease pain, but do not cure Diseases, 2. ad *Glauc.* 8. Hence *Ætius* considers that stupefiers are good for hot humours, but are bad for cold, because they thicken them, and cool very much. So *Trallianus* and *Paulus* write, that by stupefiers the cold humour becomes thicker, and more unfit for motion, the coats of the Intestines are made thicker, and at length the disposition being increased, the Disease is prolonged. Wherefore we must use Anodynes, and use Narcoticks as little as may be.

Idem, ibid.

XLIV. Most grievous pain is frequently raised by Phlegm and thick and tough humours, not contained in the cavity of the Intestines, but within the Coats of the Colon. *Galen* 12. in m. 7. In such a Colick, having purged first, bids us use attenuaters of Phlegm, dissolvers, and discutients, (yet not very hot things, lest the matter being suddenly dissolved, wind be multiplied,) and preparatives of the matter for excretion, and lastly evacuaters. Strong Clysters and repeated in the beginning doe more hurt than good, the matter being stirred indeed, but by reason of its unfitness not evacuated, and nature spoiled. Gentle things must be given also at the mouth. *Avicenna* bids us abstain from Agarick, for fear of vomiting.

Sennertus.

XLV. These cold and gross juices contained within the coats of the Intestines, must be incised and concocted, and indeed with such hot Medicines as do not discuss more than they digest, but have a faculty to discuss wind, among which *Galen* reckons Garlick. For although some think Garlick breeds wind, yet *Galen* says right, 12. m. m. 8. that of all edibles Garlick discusses wind most: for it manifestly has an exceeding heat, and such as breeds not a phlegmatick humour, but manifestly resists it.

Idem.

XLVI. Volatile Salts, but oily, do both powerfully and gently discuss wind above many other things; In the use of which I have observed something worth notice, namely, that wind is produced by them, as often as viscid phlegm sticks in the Stomach or Guts, but then the wind is dispersed and broken by their virtue, or otherwise disappears. Whence I argue, that Wind arising from bad humours in the body, be they more or less viscid, may gradually be discussed and abolished by the said Salts, which experience it self also confirms.

Sylveus de le
Boz, Frank.
l. 1. c. 14.
Sect. 59.

XLVII. This is remarkable also in the use of them, That viscid Phlegm is by degrees incised and amended by them. So that whatever either wind it self, or the matter of it require for cure, these oily Salts are able to doe it all.

Idem, ibid.

XLVIII. Most Aromatick things, out of which Oils may be distilled, seeds especially, discuss wind. The Spirit of Nitre bears away the Bell from all the rest, being every way usefull, while it corrects both Phlegm and Bile, and hinders wind from breeding; and disperses it when bred. ¶ It discusses wind, at least it forces it to fall, and hinders the new rise of it.

Id. c. 7.
Sect. 27.
Id. c. 4.
Sect. 6.

XLIX. In a tedious Colick, when all other Medicines could doe little or no good, I have known this Medicine, given once or twice, raise a salivation, to the great relief of the Patient. For if at any time the morbidick matter gathered and firmly fixed in the nervous folds, or other places about the Abdomen, cannot be moved by other Medicines, the Mercurial Particles diffusing themselves every way, easily dissolve and divide it into minute parts, and dispell them diversly hither and thither, and at length altogether disperse them: Wherefore in a long and pertinacious Colick they may sometimes successively be given for a gentle Salivation.

Willis.

L. When the Patient's Colick could not be eased by use of Medicines, and he could not move himself but with great difficulty, I came to this last resolution, to give him a decoction of *Guaiacum* wood, and its bark, in which a little *Fenel* onely was boiled: because if other Medicines were mixt with it, they would rather weaken its virtue, than add to it. And then if the Fever should cease, as I hoped it would, that a third part of wine should be added to the decoction, boiling and preparing it after such a manner, as seemed most convenient for the health of the Patient, giving him of it both morning and evening for a Julep, and for his Drink, although I had resolved not to put him upon so slender a diet, as if he had not been afflicted with so tedious a Disease, although he had formerly used a fuller diet than was convenient; by which sort of remedy he was perfectly cured of his Disease. Who unless indeed he had recovered of his Disease quickly after taking it, truly I had added a greater measure of the Bark, seeing it is more efficacious than the rind of Rhadish, Citron, Hellebore, Capers, and several other things. Nor would I have passed to other things, but have waited a few days, seeing the nature of this Medicine is such, that it exercises its strength along time after it is taken.

Alcyon's
Mandella.

LI. A Bath-keeper of Vienna after he had been wrackt 3 quarters of a year with a most grievous Colick, and had used many things amiss, and the evil seemed to be exasperated by drinking Spaw-waters, yea, and his young Wife was but lately dead of the same Disease, fearing the same fate, sent for me. He began to be convulse in his whole Body, so that I guessed the matter translated to the nervous kind about to cause a Palsie, created us this mischief. When his Convulsions were stopt by Medicines, I gave him *Guaiacum* Wine, according to *Amatus* his Precept, *Cent. curat.* 32. to cause him to sweate for five days, and he was perfectly recovered. Without doubt it was a Colick from phlegmatick humours the Seminaries of wind, got into the Guts, which being dissolved by that Diaphoretick Wine, was spent by sweate. Some laxatives were given between whiles.

P. de Soff.
bait. Ephem.
Germani
an. 3. p. 487.

LII. In a long and pertinacious Colick, where the Constitution and Bowels are hotter than ordinary, Purging waters, or Whey, and Syrup of Violets are often given with great benefit: For both these Liquors, where they agree, drunk plentifully, cool the excessive heat of the Stomach and Intestines, and presently ease and make them lax when contracted by Spasms and painfull corrugations, or convulsively extended by wind. Moreover, whereby especially (as I think) they doe good, by insinuating Saline particles of another nature into the morbidick matter, they tame and subdue the other saline and irritative ones that are in it, and often carry them off by Purge. ¶ Above all other Remedies whatever, Iron-mine Spaw-waters, drunk for a month

Willis, op.
de Colicis.

month in Summer-time, use to give the most relief: But when they are drunk, great care must be taken, that they be discharged again by Stool and Urine; lest perhaps if they should make any long stay in the body, by running into the head or feet, as they often do, they might cause the *Vertigo* or Gout. ¶ In a phlegmatick and flatulent Colick, Spaw-waters have no place, because they cool the Intestines, and double the Pain: and because they have no passage by reason of Costiveness, they distend the Belly, and encrease Pain. In a bilious perhaps they may be allowed, if the Body be loose and the Stomach rich, as can safely and easily bear the drinking of them. For *Galen 6. de loc. aff. c. 2.* writes, that reaching and vomiting are urgent in the Colick, and indeed far more violent, than in the Stone, and that the Patients vomit Phlegmatick and corrupt stuff: for the Stomach, when the Intestines are affected, does sympathize.

Idem, ibid.

Sebifius, de Acidulis, Sect. 2. differt. 2. Sect. 44.

Idem, ibid.

Hofferus, Herc. Med. l. 3. c. 5.

Willis.

Erich. Med. pract.

Willis.

Rolinc, conf. 3. l. 7.

LIII. Diureticks usually doe more good than sweats, whereby when the blood is dissolved, and its ferocities are plentifully precipitated, then the fewel of the Disease is cut off, and the mass of blood being emptied receives part of the morbidick matter, so that upon this account its reliques are easily dissolved.

LIV. Bathing must not be allowed them that labour of such a Colick; for usually their bowels are too hot, and hereby they are more heated, and the pain is encreased: Then, in an Afflux of that matter, which first bred the Colick, before the nerves be affected, the muscles are first filled, so that they cannot receive the animal Spirit, which is the chief operator of sense and motion, or, if they do receive it, yet they cannot doe their duty, because of their feeble and weak constitution, which bathing increases, and so helps to a worse translation of the matter, according to *Aphor. 5. 16.* But if all things have been tried in vain, and the pain cease not, nothing hinders but we may put the Patient in a Bath, and industriously cause a Translation of the humour, because so the morbidick matter is translated from the more noble to the ignoble parts, when there is no place for evacuation, that is, a violent Disease must be cured by one more gentle: for the bastard Palsie, that follows, in process of time goes away of it self, or is forced away by fit Remedies. ¶ Baths and Sidorificks are commonly prescribed in the Colick, yet, as far as I could observe, seldom with good success: Because these things by exagitating the blood and nervous humour, cause them to throw off more into the matter of the Colick, and the matter lodged there already, to boil and rage the more; and they very rarely discuss the matter perfectly.

LV. In the Colick Passion Diaphoreticks and Sidorificks must not be neglected, seeing it is observed by *Carolus Piso, Sect. 4. Concerning Diseases of the lower Belly from ferous matter, cap. 2.* That oftentimes these pains are much eased by spontaneous sweats, and are averted by discussing wind. And often Bile, the cause of the Colick pain, is by a spontaneous critical motion of Nature, thrust out to the outer skin in an universal Abscess. See *Castrensis, lib. Quæ ex quibus.*

LVI. We must have a care, lest by using hot things, taken inwardly, or applied outwardly, the humours become adust, and raise an inflammation. ¶ I have observed in some constitutions and tempers, that Epithems of hot things, or applied hot, rather enrage than abate the pain: Wherefore in these cases it seems not amiss to apply fomentations of a solution of Nitre or Sal Ammoniack, as in pains of the Gout, and sometimes (as *Septalius* reports) of pure cold water.

LVII. Some use a girdle wherewith they bind in the Belly strait. But I think it is to no purpose, and that it rather increases than diminishes the pain: For when the Belly is squeezed, the Colon also is

strained, and the windy matter makes the more reluctance, whereupon the pain is enraged.

LVIII. The same matter does not always cause the pain which causes the obstruction, but sometimes a divers. For store of wind with retention of the Excrements, both dissolves continuity, and causes Pain and Obstruction. But when wind is not so plentifully, and the Excrements are hardened, it is another thing that causes the Pain; for it is often observed, that a man has not gone to stool for several days, and that the Excrements have been retained without the Colick: but upon the arising of wind afterwards the Colick hath risen. If therefore the Colick be caused by some hard Excrements, hindring the passage of the rest of them, and of the wind, emollients must be used, and afterwards sharp things to irritate the faculty.

Sennertus.

LIX. When a man had recovered of a Catarrh, he fell sick of a very troublesome Colick, which encreased towards night: before it came upon him, just as he had done eating, he vomited up some pounds of clear water, without mixture of any thick Chyle. The cause of the Colick seemed to me to be the thickness of the Chyle, which for want of liquid Serum, when it could not pass the Intestines freely, raised the Gripes. I knew a Minister tormented with the Colick, who by vomiting great store of water was cured. Wherefore Hydragogues must frequently be used in the Colick, by help whereof I have often cured Patients by purging.

Bartholinus, cent. 5. obs. 58.

LX. A Girl, about two years old was tormented with periodical pains about her groin, so that neither lying, sitting, standing, nor carried in Armes, she could find any ease from her pains. This pain returned at set times; she was well from ten at night till twelve the next day, the third fit being ended, and no manifest crisis appearing, she lived free from it afterwards. There was no sign of worms; therefore I do not question but it was a flatulent Colick, residing rather in the muscles of the Belly, than in the Colon, for she was loose enough: I cured her by anointing her Belly with distilled Oil of Wormwood and Cumminseed, and giving her some Treacle in Hartshorn water.

Idem, hist. 59.

LXI. Mr. Puri of Newenburgh in Switzerland, four score years old, but a lusty man of his age, being taken with a violent pain in his left side, called a neighbouring Chirurgion, who taking him to be sick of a Pleurisie, let him blood, whereupon his pain grew worse. His Son, a worthy Pastor in the City, brought his Urine, and asked my advice. I enquired of him whether his Father had drunk any new wine lately, (it was in November) which in that year 1659. had got no ripeness. He told me, yes, and added, that his pain was below his Ribs, and not fixt in one place; I foretold him that letting blood would prove fatal to him, and indeed he died in three days, past all remedy.

LXII. No Disease almost requires a more speedy aid from Physick than the Colick, and Gripes that happen in the Scurvey. Against these evils Clysters of divers sorts, Fomentations, &c. are used. The use of Opiates is found here very necessary. Certainly *Riverius* his Rule, That purging Pills should have Laudanum in them, is very proper here; for when sleep is caused, and the Patient a little purged, the Paroxysm is frequently at an end. And testaceous powders, by which the sower salts are either imbibed or fixed, conduce very much to the driving away of the morbidick cause. For example; Take of Powder of Crabs eyes, Egg shells each 1 drachm and an half, Pearl 1 drachm. Make a powder for 4 doses, to be given in a decoction of the root and seed of Burdock, every sixth hour.

Willis.

LXIII. In a long Colick when all other remedies did little or no good, I have often known this medicine given once or twice to raise a Salivation, and give the Patient ease. For if at any time the morbidick matter be plentifully gathered, and deeply rooted, in the nervous folds, cannot be removed by other Medicines,

Medicines, the Mercurial Particles spreading themselves every way easily dissolve and divide it into minute parts, dispell them this way and that, and at length wholly dissipate them. Wherefore in a long and pertinacious Colick, they may sometimes be given with success to raise a Salivation.

Idem.

LXIV. A horn Cupping instrument is highly esteemed among the Indians dwelling under the torrid Zone; who, as they were curing a young man sick of the Colick, first gave him a Clyster with their mouth, and presently applied horn Cupping instruments to his Belly. And sucking the Air out at the little hole, they stopt it presently with their finger, both to make the instrument stick fast to the skin, and to get the wind out of the Bowels, which by these means the Barbarians did most successfully from the young man.

N. Tulpus,
l. 3. cap. 49.

LXV. Galen says that the wind Colick is cured as by charm, (and Crato approves it) if a large cupping-glass with much flame be applied to the Belly near the Navel. Observe, near, not upon the Navel, lest swooning follow, by reason of the commerce between the umbilical vessels and the heart. For a man certainly dies, if the skin be flayn off the Navel, although he may live if he be flayn all over besides, a punishment very common among the Egyptians.

LXVI. This mixture is one of the highest specifics, which I have often used successfully: Take of Spirit of Wine 1 drachm, Spirit of Nitre between half a scruple and half a drachm, Spring water 3 ounces. Let him take it, and being well covered, let him compose himself to sweat, and keep himself quiet: For it is the best way to lie still, how difficult soever it be. This is good, especially when the wind is enclosed between the membranes.

Hartman.
prax. chym.

Medicines especially made use of by eminent Physicians.

1. In the Colick, especially if it pain a man about his stomach, they say the broth of the juice of sweet Almonds is good, with some grains of long Pepper in Hippocras Wine. I have seen the pain laid with a caustick Plaster that would almost make an Eschar, and draw outwards, being applied near the Navel.

Guliel. Bal.
lonius.

2. They say it is a most effectual remedy which is made of white Pigeons dung, boiled in water till half be boiled away, adding a little Dill seed to 2 ounces of the liquor strained, and so drunk. ¶ One man commends 2 ounces of Nitre, with an equal quantity of water and oil, given by Clyster; for it wonderfully draws out thick matter, and dry, compact Excrements. ¶ The Osprey that digests all it devours, has one wonderful Intestine: It is evident that the extreme part of it tied to one, causes the Colick. ¶ The Guts of a Wolf dried and given in drink are a good Remedy.

Alex. Bened.
dictus.

3. I know a man who with the Spirit of Elderberries, as with shewing a Gorgon's Head, presently discusses the Colick pain very familiar to him: It is of great virtue in this Disease.

Blolkwit.
zius.

4. Mercury water given inwardly takes away the Colick radically, and it is thus made. The Mercury is first reduced to a Water, into half of this water put crude Mercury purified, which is also converted into water, and must ascend. ¶ Also Spirit of Turpentine given to 12 or 13 drops, is a most excellent Remedy.

Capivaccius.

5. In the wind Colick Mesues commends Oleum de Kervaa as an admirable thing, because it discusses wind most powerfully.

6. An admirable Clyster, and experienced by me in the Colick, Take of Wormwood, Rue, Fenel, each 1 handfull, Salt 2 drachms, common Oil what is sufficient. Boil them, and make a Clyster; and anoint for several days.

Seb. Corti.
lio.

7. Speedwell is especially commended, which cures the Colick specifically: It is boiled in Chicken

Broth, and to 1 pound of the broth let half a pound of Malmsey wine be added, and half a drachm of Myrrh, and so given in a Clyster. ¶ Take of tops of Sea-wormwood, Chamæmil, each 2 Pugils, white Frankincense 1 drachm. Boil them in a sufficient quantity of water, and to 4 ounces of the Colature add some Syrup of Chamæmil or Feaverfew, for 2 doses, I have cured most violent pains in the Intestines and Stomach with it. ¶ Oil of sweet Almonds drunk with Malmsey wine is very good; I add half a drachm of fresh Sperma Ceti, and account it among my effectual and secret Remedies. ¶ For preservation from the Colick a Girdle of the Guts of a Wolf dried is good, he must be girt with it day and night.

¶ The following powder hath been often tried by me in white wine; Take of Cinnamon 3 drachms, Galangale, Calamus Aromaticus, each 1 drachm, Bayberries 1 drachm and an half, Cumminseed 2 drachms, burnt Hartshorn 1 drachm and an half, Juice of Rue half a drachm, Aniseed, Fenelseed, each 4 scruples, Cloves half a drachm, make a powder; add Spec. dianisi 1 drachm and an half, Sugar 5 drachms, 2 scruples. Make a powder. The following Plaster is famous in the Gripes; Take of Emplast. de baccis Lauri, de Meliloto, each 1 ounce; mix them, make a mass with Oil of Chamæmil and Rue. ¶ In the Colick and Hæck Passion 1 scruple of Extract of Calamus Aromaticus, taken with some Syrup is very good. ¶ In the beginning also a Decoction of Speedwell in wine with half a drachm of Myrrh may be drunk, when the pain is violent. ¶ When no other Remedies would doe good, I cut some root of Masterwort, put it in a Glass of wine, and gave it to drink every day before Supper, and the Pains began to cease. ¶ Crato experienced the virtue of this Oil in several. Take of Gum Galbanum, Elemi, Ivy, Oil of Bays, each what is sufficient, distill it, and keep the first water apart, then the clear Oil, thirdly the thick Oil. He applies this Plaster to the Muscles of the Epigastrium; and successfully discusses the reliques of the Crato Disease.

8. Take of Malmsey-wine, oil of Nuts, each 4 ounces, Aqua vite 1 ounce, of distilled oil of Juniper and Rue 2 drachms; Mix them, give them hot. By this Clyster intolerable pains raised by wind and vitreous phlegm are cured to a wonder. ¶ Oil of Ground Ivy taken at the Mouth, or by Clyster, hath an admirable virtue in laying the Colick, and other Pains of the Intestines. ¶ The Secret of Joseph the Jew; fill an earthen pot with Wormwood cut very small, pour some of the best Wine to it, steep it 24 hours, then pour off one part of this macerated juice or liquor into another vessel, then set what remains on the fire, and boil it, pouring on by little and little some portion of the liquor reserved, till all the Wine be boiled away, you will find a red Powder sticking to the sides of the pot, which you must scrape off, and give of it three days in the morning as much as will lye on a Knifes point in some generous Wine; It takes away all Gripes.

Claudius
Deodatus.

9. Among outward applications to assuage a Scorbutick Colick nothing is better than green Henbane boiled in Milk, put in a cloth, and applied to the Belly warm. ¶ An ounce and an half, or 2 ounces of oil of sweet Almonds taken in some Chicken, or Pease Broth, is very good to assuage the pain, and remove the Convulsions of the Intestines.

Draconius.

10. The Quintessence of a Fox-Cub, by a certain wonderfull faculty, quickly cures the Colick; yea, he that carries this Arcanum about him in a Glass-bottle well stopt, will never be afflicted with any pain in his Stomach and Guts.

Joh. Pet.
Faber.

11. This is a most excellent thing to allay pain; Take of the Powder of the Testicles of a Horse prepared 1 drachm, Powder of Aniseed 1 scruple. Mix them, give it in Wine, or Broth. ¶ Also half a drachm of the Powder of the Sponge that is found on the wild Rose-tree, given in Wine is good. ¶ Also a drachm of Rie flower may be given in Wine.

Rod. à Font.
feca.

Jacob. Fontanus.

12. If the Colick be caused by Choler, it is an admirable remedy to drink 1 drachm and an half of dried Acorns in powder, in some Wine or Broth, with a few grains of Musk in curing of Men.

Joh. Freitagus.

13. This makes an excellent Balsam for the Colick, if an oil be distilled from a mixture of half a pound of Galbanum, and clear oil of Turpentine, to which, afterward, put an ounce of oil of Lavender, and distill it again, it becomes a generous Balsam, which circulated some time with Spirit of Wine, becomes most excellent and penetrating, if with oil of Venice-Soap, and a few drops of Spirit of Camphire mixt with it, it be applied to the Navel.

Galen.

14. Wolf's dung powdered, and given in Wine is wonderfull good.

Frid. Hofmannus.

15. I have found in my practice this Plaster doe much good; Take of *Emplastr. de bacis Lauri* 6 drachms, *Unguent. de Arthanita* 3 drachms, Nitre 1 drachm, Oil of Amber half a drachm. Mix them, make a Plaster.

P. Laurenbergius.

16. An efficacious oil of Daffodil is made of Daffodil-flowers steeped in Oil-Olive, which is proper, both anointed outwardly, and given in a Clyster.

Ortolphus Maroldus.

17. An infallible Powder for the Colick; Take Crabs No 100. set them in a new earthen dish in an Oven, when the bread is drawn, but burn them not. Make a Powder. The dose is a spoonfull or two in good sweet Wine hot, and the pain will assuage by degrees. ¶ This is a good experiment of *Carpus*; Take some Mouse-dung made up with Oil-Olive into the form of a Chestnut, and lay it on the Navel.

Panorolus.

18. I have often had experience of Oil of Bay-berries, or Orange-Pills drawn with Wine by expression: which being done, the Patients in a short time finding ease, fell asleep, and recovered.

Simon Pauli.

19. There is a singular Medicine made of that yellow bitterish membrane or coat, which most closely invests the Kernels of Walnuts, 1 drachm of it powdered is given in Wine for the Colick, warm.

Joh. David Rulandus.

20. Rotten Dung found in Stables, where Beasts piss, fried in Oil and applied, wonderfully eases the pain. ¶ Let warm Sheeps-dung be long mixt with Goat's Sewer, strow on it Powder of common Pitch. Mix them and apply it warm, without doubt it has a wonderfull effect. ¶ A Clyster made of Dog's-turd boiled in Wine with a few Figs, eases the pain of the Colick and Stone. ¶ Hare's dung dissolved in Wine and drunk, cures a desperate Colick.

Saxonia.

21. I do upon my credit profess, that I have in one day cured the Colick coming of phlegm with 2 drachms of *Diaphanicon*, and 2 drachms of *Spec. Hiera*, and presently took away the Pain.

Schroderus.

22. A Carminative Water made of Chamæmil is of great virtue in the Colick. ¶ An Electuary, or mixture of Garlick is good in the Colick. ¶ A Cataplasim of Chervil is good. ¶ Ear-wax is a present remedy for the Colick, if it be taken in drink.

Schwentfeld.

23. A Lark with her feathers burnt to powder in an earthen pot, and three spoonfulls of it be drunk with hot water for two or three days, is an incredible remedy for the Colick, and all Pains of the Guts.

Sofenander.

24. Powder of the Huckle-bone of an Hog, burnt, given in Wine, wherein Seed of Sermourain and Chamæmil-flowers have been steeped, I have often tried to be an effectual remedy in this case.

V. rignani.

25. A decoction of Coltsfoot in Water or Wine is a most effectual Remedy.

Weikartus.

26. The white part of Hens dung powdered, and given in Pansey, or Pimpernel-water, is a present Remedy, especially for children.

Zimera.

27. Cinquefoil dried and powdered, and 2 drachms of it drunk in generous Wine is a present Remedy.

Colica Hysterica, or the Hysterick Colick.

Its Description and Cure.

There is a sort of Hysterick disease, that vexeth some Women, and is so exactly like a bilious Colick, as well in the sharpness of Pain, as in situation, even then also yellow and green humours being cast up by Vomit; that I must treat of it, lest it be taken for the bilious Colick.

Women who are of a lax and crude habit of body, do contend with this evil above others; and they that have laboured sometime formerly of some hysterick affection; or (as it often happens) they that have scarce escaped after difficult and laborious travel, by reason of a large Child, which hath too much exhausted the Mothers strength and nature. A pain, very little milder than in the Colick and Iliack Passion, at first seizeth the region of the Stomach, and sometimes a little lower, which is attended with enormous Vomiting, sometime of green matter, and sometime of yellow. And they accompanied (as I have often observed) with greater dejection of mind and despair than in any other disease whatever. After a day or two the pain ceaseth, which, nevertheless, within a few weeks, returns more cruel than the fit before. Sometime it is accompanied with a Jaundise conspicuous enough, which, in a few days, vanishes on its own accord. All Symptoms ceasing, when the Patient thinks her self well enough, the least commotion of mind, whether it be raised by anger or grief (to which, in this case, Women are very subject) commonly recalls the pain; the same may be said of walking, or any other exercise unseasonably undertaken, seeing by such causes Vapours are elevated in a lax and infirm habit of body. When I say, Vapours, whether they be such, or *Convulsions* of particular parts; the *Phænomena* may equally be solved either way. These Vapours, or Convulsions, when they invade this or that region of the body, produce Symptoms accommodate to the part they invade: And therefore, though they cause one and the same disease every where, yet they exactly resemble many, wherewith the wretches are tormented. Which is clear from this disease, that, when it possesses the parts adjacent to the Colon, is as like a bilious Colick as can be. Nor is it less apparent in many other parts of the body affected in the same manner, for example; Sometimes it affects one of the Kidneys with a most violent pain, whereupon follows Vomiting; and sometimes also the pain being carried along the duct of the Ureter, it resembles the Stone; and when it is exasperated by Clysters, and other Medicines, that are lithontriptick, and designed to void the Stone, it long afflicts the Patient after one and the same tenour, and now and then (which is contrary to its custom, because of it self it is without all danger) brings her to her grave. Moreover, I have seen Symptoms produced by this disease, that were altogether like the Stone in the Bladder. It is not long since I was called out of my bed one night to a Countess my neighbour, who was taken with a very violent pain in the region of her Bladder, and a sudden stoppage of Urine. And because I very well knew she was subject to divers hysterick diseases, and therefore guessed she was not sick of that disease she took her self to be sick of; I would not suffer the Clyster to be given her, which her Maid was making ready, lest her disease should thereby be increased: but instead thereof, and of Emollients, as Syrup of Marshmallows, &c. which the Apothecary brought; I gave her a Narcotick, which presently put a stop to that Symptom. Nor indeed

deed is any one part of the body altogether exempt from the assaults of this disease, whether internal or external, as the Jaws, Hips, Thighs and Legs; in all which it causes intolerable pain, and when it departs, leaves a certain tenderness, that cannot endure to be touched, just as if the flesh were fore beaten.

But as I have by the bye delivered some things pertaining to the history of the Hysterick Colick, lest namely it should be mistaken for a bilious one, so I shall by the way likewise touch certain things that make for the cure of the Symptome, the pain which accompanies it. For the radical cure, which takes away the disease, by taking away its cause, is for another Speculation and Place.

Letting blood and repeated Purgings, which are most plainly indicated in the beginning of a bilious Colick, have no place here, except in the case hereafter mentioned. For experience teacheth, that the pain is exasperated, and all other Symptoms grow more violent, being helped on by the tumult, which these things raise. And thus I have more than once observed, that the repetition of Clysters, even of the gentlest, has brought on a long train of Symptoms. Reason also will second Experience, which tells us, that this disease is produced rather by some ataxy and inordinate motion of the Spirits, than by any fault of the humours; to wit, if we well consider those circumstances, to which, for the most part, it owes its original; Such as are great and undue profusions of blood, violent motions either of mind or body, and things of the like nature. All which things forbid the use of those remedies, whereby a greater perturbation of Spirits may be raised; and instead of them Anodynes must be used, though the green and ill colour of the matter Vomited seem to indicate the contrary: For the speculation of Colours is too subtle and minute, to be able to give any authority to evacuations, which *ipso facto* we find hurtfull. And I do not at all question, but this disease (which though it cause much pain, yet never death) oftentimes becomes mortal, through errors committed upon this account. Besides, if one should give a very strong Vomit to day, that he may, as he thinks, get out the matter of the disease; the Patient will, the next day, Vomit matter as green and ill coloured as she did before.

Yet we must take notice, that sometimes such store of blood and humours is found, that it so far hinders the operation of the Narcotick, that be it never so often repeated, it will never stop their fury, except the Patient be first let blood, or purged; which I have observed in Women of a more sanguine complexion, and in Viragoes. If the case stand thus, way must be made for the Anodyne by letting blood or purging, or it may be by both. For after either of these is done, the Narcotick, which, given in the highest dose before, would doe no good, will now in a very moderate dose obtain the effect for which it was designed. But this thing seldom happens, and when it does, these remedies must not be repeated. Which things being premised, we must proceed in giving Anodynes, if there be occasion for them, in that method, which we proposed in the bilious Colick, and they must be given more frequently or sparingly, according as the pain returns. Which method indeed onely respects the present and instant Symptome of most violent pain: for in this place I have not undertaken to treat of that, which opposes the Cause of the Disease.

Coma Vigil, or the waking Lethargy.

The Contents.

Narcoticks are given with benefit. I.

An Idiopathick one must have one cure, a Sympathick one must have another. II.

I. **A** Waking Lethargy is seldom a Disease of it self, but is for the most part a Symptome, and follows other Diseases, as a Fever Phrensie, proper Lethargy, and such like: Wherefore it requires not a peculiar method of cure, onely there seems to be a necessity that other Cephalicks be joined to the remedies primarily indicated, which may dispell these Meteors of the Brain like Clouds and Lightning, or if both of them together (*Waking or Sleepiness*) cannot be removed, let the Medicine take part with one of them, that being made stronger, it may conquer the other; so that in a sleepy watchfulness, it is convenient to cause either perfect sleep, or perfect watchfulness. For in this case I have often given Narcoticks with good success.

II. The Cure of a waking Lethargy, that is Idiopathick, is performed by the same means, whereby a Phrensie and a Lethargy useth to be cured; and if it incline more to a Phrensie, the remedies for a Phrensie must be most used; but if it incline more to a Lethargy, then things proper for a Lethargy must be most used. But the cure of a Sympathick Coma depends on the cure of the malignant Fever, whence it had its original. Yet Remedies that make revulsion of those Vapours from the Brain, must peculiarly be used in the beginning. And if any thing appear to be fixt in the Brain, Derivation by opening a Vein in the forehead, or by setting Riverius. Leeches behind the Ears, &c. must be endeavoured.

Combustiones, or Burns.

Whether the Cure should be performed by Coolers? I.

A Remedy that heals without any footstep of a Scar. II.

Whether the Blisters should be opened presently? III.

The heat must be extinguished with Internal things. IV.

Medicines.

I. **S**OME, according to the thread-bare Axiome of Physicians, That Contraries are Remedies of their Contraries, think that Burns should be cooled, and therefore that Coolers should presently be applied to the burnt-parts; but this opinion hath its rise from a false ground, namely, that Burning is onely Alteration, and an Induction of a hot quality, when yet the very fire and its Atoms are communicated to the burnt-parts, and an *Empyreuma*, as all must confess, is brought upon it. For what is this *Empyreuma* but the small particles of the fire, which have insinuated themselves into the burnt-part? And Experience it self teaches, that Burns are not cured with cold things, but that by them, the fiery particles being repelled inwards, the Pain is increased, inflammations, yea, and Gangrene and Mortification is caused; whereas hot things, that take out the *Empyreuma*, doe good: For even the Vulgar know, that the burnt places must not be put in cold water, but rather held a while to the fire. Now Likeness causes attraction, and the external

Sennertus,
praef. l. 5.

ternal fire draws out the internal, and what is burnt into the part, as *Paræus* speaks. ¶ If contraction arise from a Burn, it will be cured by drawing out, and tempering the heat communicated to the part, and by altering as well the containing as contained parts, vitiated by the fire. Fat things draw out the fiery heat, as being the true fuel for fire: And Oil of Walnuts and Rapeseed are commended above all other things. Acids allayed with a lixivious Salt, such as a solution of red or white Lead made in distilled Vinegar: For the sharpness of the Vinegar is taken off by the Lead changed into *Ceruss*, or *Minium*, whereupon the Vinegar grows sweet: this Vinegar impregnated and edulcorated with the Lead, if it be shaken together with some Oil, will become a Mixture like an Ointment; for the Oil grows thick with the acid Spirit of Vinegar dulcified by the Lead: And while this Liniment is applied, and the relics of the fire penetrate the Oil, its force is more broken by the Acidity joyned with it. And the vitiated parts are corrected and amended of the burning, especially by the acid Spirit joyned with the Fat. For seeing the external fire does first of all seize the fatness and oiliness of the parts of the body; when that is consumed, their Lixivious Salt, that used to be tempered with it, grows sharper, the acid Spirit vanishing together with the fat. Whence it is manifest, both the Oil and acid Spirit must be repaired and restored, that the acrimony of the Lixivious Salt may be tempered. Now both concur in the said mixture, wherein is store of Oil, and that tempered with an acid Spirit, but refract: Whence it is that the retorted Salt, does not make any effervescency upon meeting with the acid Spirit, because broken; but is gently corrected by it, and reduced to its former temper. And these same things are not onely proper in Burns that cause shrinking, but in all: For by these and the like Remedies I have several times cured Burns.

Sennertus.

Wedelius.

II. Take Whites of Eggs, No ij. Oil of Roses 2 ounces; Mix them well, then let a piece of thin white Linen or Silk be wet in the Liniment, and applied to the burnt place, and let it not be taken off till the ail be healed; but every day twice or thrice at least, let the Linen be wet again: After 4 days are over, instead of Whites take Yelks of Eggs, and so let the use of it be continued, till it be skinned over again. Then, as a new skin comes, the dead skin must by degrees be clipped off day by day, till it be all taken away; which done, no mark of hurt will appear.

III. If Blisters and Pustules arise, and the Sore be not at all the worse, they must not presently be opened; for if they should, the place will smart, because the skin is laid bare, and the cure will proceed more slowly; but on the third day, when the skin begins to grow again, they should be opened, and the opening must be deferred no longer, lest the contained humour grow sharp and erode the skin.

IV. The Heat may be restrained at the same time inwardly: *Digby*, in his Treatise of the Sympthetic Powder, highly commends Spirit of Salt, as an excellent Balsam for this purpose.

Medicines especially made use of by eminent Physicians.

1. That hair may grow on burnt places; Take Fig-leaves fried in Oil, and apply them with some Ointment instead of a Plaster. *Agrieta.*

2. This is wonderfull good for burns; Take of Verdigrease and Litharge of Silver, equal portions, mixt with Wine and Oil. Anoint with a Feather. *Abius.*

3. Oil of Saturn is very good for Burns. ¶ For Burning or Scalding, in Oil, Fire or Water; Take of Oil-Olive 2 ounces, Whites of Eggs No xvj. shake them together, till they become an Ointment: anoint the place. There is not a better Medicine in Nature. ¶ Take *Saccharum Saturni* what is sufficient, add Oil of Roses; Mix them, make an Unguent, anoint the place, within 24 hours it extinguishes the heat. *Joh. Agricola.*

4. For Burns; I have known people cured in 9 days, who have been burnt with Gunpowder or some other way, with an ointment of pure and fresh Oil of Nuts, mixt with as much Yelks of Eggs, anointed on the burn twice a day. ¶ A good Ointment also is made of the middle rind of Elder, cut and mixt with the fat of a Loin of Mutton, Oil-Olive, and Juice of Prick-Madam; or with Oil onely. ¶ A wonderfull Oil for a Burn: Let fat boiling gently fall drop by drop upon Bay leaves, anoint the burnt place with this Oil, and in 3 days it will be cured, as by enchantment, though the place be very fore Burnt. *Pet. Borel-lus.*

5. Take Water in which Quicklime is quenched, shake it till it be thick, with Oil of Nuts first boiled, and anoint the place 7 days. It is a present Remedy. *Chalmers.*

6. Take fresh Butter not salted, boil it with Goose-dung, strain it over cold fair-water: Melt it again, and pour it on fair-water as before: The oftner this is done, of the greater virtue it will be: Last of all, let it be washed in Rose-water. Anoint the place with it, it presently asswages the pain, and cures old deep Ulcers caused by Burning. *D. Martelli-us.*

7. The following Unguent powerfully draws out the Burn, and suffers not Blisters to arise; Take raw Onions 2 ounces and an half, Salt, Venice-Scope each 1 ounce; Mix them; Add of Oil of Roses and of sweet Almonds, what is sufficient. Make an Unguent. ¶ The Cure of the second degree of Burning; Pickle wherein Sauces are kept, made of Vinegar, Water and Salt; if cloths be dipt in it, and applied (but not to the eyes) doth wonderfully repress the humours, assuage pain, and oppose the Burning. ¶ This is a most excellent Unguent for all Burns; Take of fresh Butter washed in Rose-water 3 ounces, Oil of Olives, Eggs, Sweet Almonds, each half an ounce, Barly-flower 2 ounces and an half, Saffron 1 drachm, Mucilage of Quince-Seeds 1 ounce and an half, Wax what is sufficient. Make an Ointment. It mollifies, lays pain, and, by little and little, brings a Cicatrice. ¶ This is a most excellent Unguent in all Burns. Take of *Diapalma* Plaster 2 ounces, fat of a Hen, a Goose, each half an ounce, melt them; add of burnt Alum, calcined Lead, Litharge of Gold, *Lapis Calaminaris* each 1 drachm, with as much Mucilage of Quince-seed and Fœnugreek as is sufficient in a Leaden Mortar, make an Unguent. *Gul. Fabricius.*

8. A Man's Face that was burnt with Gunpowder, was restored and healed with Butter of Saturn, presently applied with Spirit of Henbane and Mandrake, and Rose-water, these Remedies being often changed, that they might take off the acrimony of the burnt Nitre. The pain ceased within three or four hours; and within six or eight days he was perfectly cured, onely with Butter of Saturn and Yelks of Eggs. And the Butter is made thus; Of red or white Lead, or Litharge well boiled in Vinegar, that Vinegar filtered is joyned with Oil of Violets,

Violets, or of Yelks of Eggs; and these two, with much shaking, are converted into a Butter, which is called Butter of Saturn. It is a secret for all burns.

Joan. Petrus Faber.

¶ The earth of Quick-lime, deprived of all its Salt, by many washings, is a very effectual Remedy, if it be mixt with Oil of Violets.

Forestus.

9. A Boy of mine, being sick of the Small Pox, fell in the fire and burnt his eyes; but after I had made a Mucilage of Quince Seeds in Rose-water, and anointed his eyes often with it, the Child recovered to a miracle, without any mark of burning: Which Remedy I have also used with success in others.

10. Oil of St. John's wort mixt with washed Lime, is a most effectual Remedy in any Burn, though it be with Gunpowder. ¶ If the hands or feet be scalded, hold them a good while in strong Vinegar, or apply Linen-clothes dipt in Vinegar, and not strained out: for it allays pain and heat, and hinders Blisters. ¶ The Juice of Onions is reckoned also a most excellent Medicine; or raw Onions pounded with Salt and applied; but this must be done in the very beginning, while the Skin is whole, and not excoriated; otherwise it would doe much harm.

¶ If a Burn be caused by Shot, Take of Litharge a quarter of a pint, boil it gently in an Iron frying-pan, till the Vinegar tast sweet; then separate it for use. Take of this Water 1 ounce, in which dissolve of Nitre 1 drachm, Camphire 1 scruple. Mix them, make an Unguent, which must be injected hot into the wound by a Syringe, and a tent must be covered with this Balsam; Take of Oil-Olive half a pound, Turpentine 4 ounces, best White-wine a pint and an half, Flowers of St. John's wort 3 handfulls, Mullein a handfull and an half, Red-roses, Chamæmil, each 1 handfull, lesser Centaury 1 handfull and an half, Celondine Flowers half an handfull, Self heal 1 handfull: Draw off the Wine by an Alembick in ashes, then strain the Oil from the Flowers, put fresh Flowers again to it, and digest it for a month in the Sun. This is a most powerfull Balsam in all wounds. ¶ This also is admirable; Take Oil-Olives 3 ounces, put to it some Elder, or Rose-Vinegar, shake them, till they come to the consistence of an Unguent. Anoint the Sore with this Ointment.

Sam. Hefner.

11. Take Ly made of Quick-lime, and common Salt, put to it a little Oil of Hemp-seed, Olives, Linseed, and some Whites of Eggs, let them be all well shaken together, and the burnt place anointed. It heals without all pain, leaving no Scar behind, as Semienovius testifies.

Athan. Kircherus.

12. I have anointed the sore place with Cowsdung mixt with Linseed-Oil, and heated over the fire, and it did a great deal of good.

Kornthavenus.

13. An admirable Plaster for a Burn. I have used several things, and I approve of nothing above this: for as soon as it is applied it asswages pain, afterwards it takes it away, and presently heals with infinite celerity; Take of Litharge of Silver a pound and an half, Hogs-lard purified a pound and an half, Pontick Wax a pound and an half, six Yelks of roasted Eggs, which you must bruise and mix with the Litharge powdered; Melt the Wax with the Lard, then let them cool, and afterwards mix all together.

Scribonius Largus.

14. Take Bay leaves, let some burning Bacon drop upon them from on high, till the Leaves be turned into ashes, let the Ashes with the fat be reduced to the form of an Unguent; Anoint the burnt place twice a day: and you will find it whole in five days.

Amatus Lulitanus.

15. Moist Clay (if the burn be not deep) applied to the place is an easie and good remedy.

Panarolus.

16. Take scalding hot Butter, pour it on cold Water, shake them so long together, till the Butter be like Snow. Separate it from the Water and keep it. Anoint the Burnt place all over thrice or oftner a day. It certainly cures any Burn.

Paracelsus.

Prævotius.

17. Oil wherein Red Poppy Flowers have been infused for a year in the Sun, is admirable.

18. Water distilled off the leaves and roots of Fern is exceeding good, if applied with clothes wet therein. ¶ Take of Phlegm of Vitriol and Alum each half a pound, Mullein flowers, and black Ivy-leaves each 1 handfull, of Snails, Frogs, Creyfish, each No. x. distill them in a Leaden Alembick in a sufficient fire. Foment the burnt place with this Water five or six times a day.

Quercetanus

19. Anoint with Oil of Sulphur morning and evening, apply Emplast. Diaphanum, and the pain will presently cease, and the Sore heal.

Rulandus.

20. If the Skin or Beard be Burnt by a Shot, this is a good easie Medicine; for it hinders Blisters, and breeds Hair; Take the Juice of Onions roasted in Ashes, wherewith anoint the Burnt or bare place three or four times every day.

Schrad.
Querc. reds.
viv.

21. A Chirurgion anointed a Man's Face that was Burnt with Gunpowder, with this singular Ointment four times a day, and in a weeks time he cured that huge Burn, without any Scar; Take of Fresh Butter often melted and washed in Water, of Frog-Spawn 6 ounces, Oil-Olive 2 ounces; Mix them, make an Ointment.

Scultetus.

22. Take live Crabs, as many as you please, as much Fresh Butter as is sufficient, boil it and scum it, put in the Crabs bruised in a Mortar; boil them till they grow red, afterwards strain it and keep it for use. It is very effectual.

Sennertus.

23. Nothing is better than a Glew made of the Ears and Genitals of a Bull.

Medicines.

I. **T**hat you may know, when in people convulse blood should be let, you must distinguish, whether the body be full of humours; yet wanting a Fever, or be accompanied with a torpid refrigeration: Or again, whether the body be lean and void of Excrements. So, when a Fever has preceded, or is coming on, through abundance of humours, and a prohibited discharge, blood must be let, yet not always in the beginning: For it should be deferred, till the dense Skin be opened, and the humours be made thin by the force and efficacy of the febrile heat; otherwise you must expect taking away blood will doe hurt; for this is the chief reason, why Men commonly fear to let those blood, that are cooled: But if this happen in a full body, we must not scruple to begin with blood-letting; for whatever Refrigeration proceed, it is manifest such bodies are convulse, because daily Efflux being prohibited, puts the blood in fastion, causes greater Repletion, and sometimes Convulsion.

tion. Besides, unless you first evacuate the body, you cannot use topick remedies without danger. Therefore you must go the middle way, and at first you must bleed more sparingly, as while the torpid Refrigeration is very urgent (in which *Hippocrates in Boacis* forbids blood-letting) although the Fever increase, yet we must use hot remedies at the first access of the Disease, whereby the humours that are concrete with cold, wanting spirit and heat, and therefore as it were immoveable, may return to their former natural state, so as to run freely by opening a vein.

Mercatus.

II. Convulsions that are without any inward Inflammation or Ulcer, and come of the redundancy of Humours, may be cured by Purging: But such as follow a burning Fever, or Phrensie, or any plentiful Evacuation, or inward Inflammation, or caused by Ulcers, are hurt by nothing more; for a Purge doth, by evacuation, dry the Nerves, and by its evil quality, irritate: After a burning Fever, or evacuation, the Nerves are dry: They that are convulse by wounds, are put up as with a *Phlegmone*; and crude Inflammations are hurt by the agitation, which Purges raise, and yield not to evacuations. I remember a certain person, who, when after a Phrensie he was taken with Convulsive Motions, did, contrary to my mind, by the advice of another, take a Purge, and a little while after, no evacuation following, died.

Vallesius, 5.
Epidem. 476.

III. *Hippocrates*, Aph. 57. 4. says, A Convulsion is cured by a Fever following, and lib. 2. *Epidem*, Sect. 5. he advises, if a Fever come upon a Woman in Childbed, to raise a Fever, which must be understood of a Convulsion from Repletion, which is familiar to Women in Childbed, so a Fever is not improper, as it consumes the Humours, and dries the Nerves. But seeing a Fever once kindled (which the *Arabians* allow to be an *Ephemera*) cannot be so moderated, as not to transgress its Limits (for a small one is to no purpose) and oppose the disease, and not hurt Nature, we must think of safer remedies, and indeed of blood-letting in Childbed-Women, which may be more safely done, because it is without suspicion of Putrefaction, which it is the nature of a Fever to cause. Besides, more strength is required to undergo a Fever, than letting of blood.

IV. *Hippocrates* 5 Aphor. 21. and 3 de morbis, in a *Tetanus* without an Ulcer, approves of a large profusion of cold water in the heat of Summer, which *Galen* accommodates to other kinds of Convulsions, that is, by help of the innate heat forced inwards, which consumes the matter of the disease, or by shaking the Body, and so removing the Humour sticking to the Nerves. *Paul* says, that this remedy is disapproved by latter ages: Yet *Valesius de Tarenta*, l. 1. c. 21. used it, and cured two of a *Tetanus* in this manner; He caused the Patient to be held upright by four Men, and poured 24 Buckets of Water upon his neck, and all his lower parts, and presently set him before the fire, and half an hour after anointed him from his neck to the end of his Back-bone, his Loins and Arms, with *Unguentum Dialtheae*, *Martiatum*, *Agrippae*, and oil of Castor, afterwards he gave him some Chicken-broth to drink; and so they both recovered.

V. Hot things are not convenient for a Convulsion caused by an Imposthume; nor for one caused by a hardness left in the conclusion of an Imposthume, because so the thick Humours turn as hard as Stone; nor for that which is caused by a hot Vapour, or biting. It remains therefore, that they are good for one caused by crude and phlegmatick alimental humours, not for crude ones, and such as are unfit for coction, which hot things would make harder. Which *Galen* 2. aphor. 29. explains, saying, that a Fever cures a convulsion caused by glutinous and cold Humours, whereby people are nourished: For such Humours grow thin by virtue of

hot things, and partly turn into sweat and vapour, and partly into the substance of the thing nourished; but crude and vitreous Humours, with hot things, do turn into knots and *Scirrhi*. They err also, who in a convulsion, caused by alimental phlegm, use hot things; because neglecting method, they consider not the cause, and what is urgent: For it often comes to pass, that the virtue of the Nerves is so weak, that it can do more in indicating its own preservation, than the phlegmatick cause can in its removal. For *Galen*, 5. aphor. 2. says, Hot things resolve the substance of the Nerves. Experience hath often taught me, that people convulse through repletion with cold Humours have been killed by using hot things.

Sanctorius,
Meth. 7. 2.
l. 15. c. 3.

VI. A Military Man had his whole right Arm shot off with a Cannon Bullet. When it was cured, a kind of Convulsion followed, in which the Head was drawn to the right-side, and his Jaws quivered. He advised with several, and when I came to him, and he related to me all his Ails, it came into his mind, that some latent Venereal Poison might produce this Evil: for he said, before he was wounded he had a violent Gonorrhoea, which nevertheless was perfectly cured. I therefore advis'd him to try the Remedies for the Pox; and having first Purged and Sweated him, I rubbed him with Mercurial Ointment, which raised Salivation; and after the third day of his Salivation, those Contractions and Convulsions ceased, and the Patient was never troubled more with that disease.

Ozias Ay-
mar, apud
Riverium,
obs. 10.

VII. In a *Tetanus* and other Convulsions of the neck, *Rondeletius*, l. 1. meth. c. 37. says, That a vein should be opened, which is seen stand out in the first vertebra of the Neck. ¶ *Mercatus*, l. 1. Pract. c. 15. confirms it, in a Convulsion arising from thick and viscid humours, which being opened, he says, All the phlegmatick humour, that contracted the Muscles, is drawn out by derivation from the Neck: But that vein is obscure, by reason of its smallness, and in dignity gives place to the axillary.

Bartholinus,
cent. 4. lib. 2.
33.

VIII. As to what concerns the way of Cure in general, to be used for these strange Convulsions, it will not be easie either to assign Remedies equal to these Herculean Diseases, or a method of cure that is certain and confirmed by frequent experience; for besides that these cases seldom occur, we may moreover observe, that the self-same Medicines, which did this Patient good at this time, will doe another, or the same at another time, no good at all. The reason whereof seems to be, by reason the cause of the disease consists in the discries of the nutritious juice, which liquor is not always perverted one and the same way; but it gives a different sort of morbid disposition out of the manifold combinations of Salts and Sulphurs, and now and then it changes it. Wherefore in such most grievous affections, not every common Medicine in an Apothecary's Shop must be used, but *Magistralia*, and things proper for the occasion, must be prescribed, according to the appearances of these strange Symptoms. A gentle Vomit, Purging and Bleeding, may first be celebrated; and may be repeated several times, as there shall seem occasion. And as for Specificks and Medicines appropriate to such cases, seeing the chief Indication is to amend the crass of the Nervous Juice, we may try several things, and search out their Virtues by their effects, therefore it is lawfull to try, what remedies endued with a Volatile or Armoniack Salt, can doe. To this purpose, Spirit and Salt of Hartshorn, Blood, Smoak, Flowers and Spirits of *Sal Armoniack* may be used. When these things doe no good, we may come to Chalybeates, Tinctures, and Solutions of Coral and Antimony may be given. Which sort of Medicines must be given in such a dose and form, and so often, as that they may make an alteration in all the blood and Nervous Juice. Moreover, if such

Willis, Pa-
tholog. Cere-
bri, c. 9.

such things have no success, we must proceed to Alexipharmacks, which are good against the poison and malignity communicated to the humours. It is very probable, Medicines that are good for people bit by a Viper or mad Dog, of such as are taken inwardly against Banes and Poisons, may also be of use in the above-said Convulsions. See also the method of Gr. Horstius in his Tract de morbo convulsivo epidemio. ¶ Add to these things made of Cinnabar, whose efficacy Hofman extolls, in his Clavis Schraderiana, against the Epilepsie, and all grievous diseases of the brain and nervous kind, p. 291. &c. where is the description of the Cephalick Specifick of D. Joh. Michael, p. 293. Wedelius in Pharmac. &c.

IX. Gasper de Roulla lay contracted in his bed a whole year, but the last five Months of the year wholly immovable, he could not move a foot, head or arm, nor any thing else: for beside his great pain, his limbs were as stiff as a stone, and it was mid-Winter. It is well known I cured him in forty days, to the astonishment of all that saw him. I thus cured him; I abstained from all Ointments, by the use whereof especially, when his body was not purged before as it should be, the disease came to such an height. I let him blood thrice, although with extreme difficulty, because his arms were contracted, nor could he stretch them out: for his neck, legs, back and arms were as stiff as a stone or stick. While I had him in cure he often despaired of health, so that he was willing I should desist from the cure, for the first 25 days he found not the least relief. He was cured by the Marshal's cure, but as I said before, being thrice let blood, not onely by reason of the greatness of the disease, but because I guessed from his course of life, and the disease it self, that his whole mass of blood was corrupted. Nor did my judgment in this thing fail me at all, for all the blood that came from him was corrupt. His neck stood awry, as a remainder of so great a Disease.

Cardanus.

X. Whenever a particular Convulsion has its rise from a puncture of a Nerve or tendon, as it sometime happens, either through the Chirurgion's unskilfulness, precipitancy, misfortune, or disturbance of his mind, while he is letting blood, then, as soon as can be, warm Oil of Turpentine, with rectified Spirit of Wine must be put into the wound, as Paræus Chirurg. l. 9. c. 38. writes, was done with good success to Charles the Ninth King of France. ¶ My Wife underwent the like misfortune in the year 1669, although a very skilfull Chirurgion let her blood; for forcing his Lancet too deep into the median vein, he prickt the tendon also that lay under it; in a few days after a stiffness and inability to motion in her arm followed, hereupon a contraction, and knot, or a Ganglion. By some bodies advice, to which I agreed, she received the blood of a Horse, which dropped from a Vein opened in his Neck upon her Arm, whereupon, in a little time, she was able to stretch out her Arm. The remaining Knot was dissolved by applying a Plaster of Gum Elemi. See the Affections of the Nerves, Book 12.

XI. A Boy from his birth held his head towards his left shoulder, because one of the second pair of Muscles, or that Ligament which bends the head and neck forwards, was too short or crooked, which ill-favoured figure of his immovable transverse-head, not being reduced to its natural state by any means, it was agreed that G. Straten should cut that tough band athwart, which twined the head so much upon the shoulder. He began the Cure with a potential Caustick, then he directed his knife above the Collar-bone, from the Ear to the Throat, but either slower, because of the toughness of the Scab, or more timorously, because of the nearness of the Jugular Veins and Arteries, than the nature of that tendon and the Nerves required; which therefore being hurt rather by pricking than cutting, a violent Convulsion of the Neck, Face and

Hands presently followed, which, notwithstanding, immediately ceased, when he forced his knife deeper in, and more courageously cut all the Muscle that was in fault: The cutting whereof presently restored the perfect use of an erect figure to the head, and the liberty of moving it self every way: Which nevertheless, lest he should abuse, the Head was swathed about every way with rollers, which, when the wound was healed, being removed, that inveterate inclination to the affected side did remain for some while; so difficult it is to correct long Custome. Whoever therefore hereafter you be, that shall put your self on so doubtful and hazardous an enterprize, do not despair, but what has been once done may be done again; but know, that three things especially should be avoided, and 1. That you raise not a Scab on the skin, which is so far from easing the pain, that it rather hinders the sight, and the knife from cutting. 2. Lest by rash cutting you rather kill than cure your Patient. 3. You must endeavour not at another time, and by turns, but altogether and at once, yet cautiously to cut the whole Muscle, on which lies the main stress of the Cure. Which Animadversion certainly, as it will be a credit to the Chirurgion, so it will be of no small benefit to the Patient.

XII. A Boy five years-old had enjoyed his health very well till he was four; about the beginning of the fifth he began to grow ill, with decay of strength and innate heat, at length a lingering Fever, and a swelling in his belly took him, which were followed with contraction of his Arms; but of his Feet especially, so that he could neither stand nor goe any more. I supposing that Worms were the cause of this change, took Riverius his way of cure, cent. 1. obs. 16. to kill them, which I did with good success, and at one time I brought nigh thirty away; and the days following, but at several times, I brought away above forty, so that the Boy could in a short time after stand and walk.

XIII. The Nerves of a Man's Belly are seldom contracted; yet more frequently than some Physicians take notice, believing that all pain in the belly is caused either by sharp choler, or by wind distending the Gut-Colon: But the unequal distention of the belly, and the strait contraction of the rigid Muscles, do clearly enough argue, that more than the Guts do suffer. A Matron had gathered in her cold and moist stomach plenty of crude phlegm, which, although Medicines carried it off, insinuated it self by degrees into those sensible Nerves, which the Spinal Marrow disperses, both through the Membrane encompassing the belly, and through the Muscles lying next upon it. Which being beset with this crude matter, a remarkable Convulsion of her Belly did torment her, especially if she were with child, and at night. Which pain of hers notwithstanding scarce ever left her, till the cause were purged as it ought by Mechoacan root, or the sharp Vapour thereof, and the wind that oppressed her heart were dissolved, either by Mithridate given her to drink in the evening, or by giving her a Glyster betimes before her torment came. Which way of cure evinces, that this Convulsion had its original from crude and flatulent phlegm.

XIV. One, after he had taken the fume of molten Tin at his mouth and nostrils, was suddenly taken with an Opisthotonos, and then with a most grievous Tetanus, so that he could neither open his mouth nor swallow any thing. D. Brambachius orders Palmarius his Cordial Water to be forced down, but his throat denies it passage; He also prescribes Clysters, he orders fumes of Sulphur (thinking it an Alexipharmack for Quicksilver) and Inunctions for the neck of proper things; but all in vain, for he died in twenty hours. ¶ So a certain Goldsmith, as he was gilding silver Corslets, and did not take care, as he ought to have done, of the fume, was taken with a shaking in all his Limbs, and was per-

feebly restored onely by the use of Stapedian Treacle-Water, having tried other things in vain.

Medicines especially made use of by eminent Physicians.

1. In a Convulsion caused by a wound in the head, this is a most excellent Remedy; Take Oil of Snails, Worms, *Sesamum*, each 1 ounce and an half, Fat of a Wether, a Fox, each 1 ounce, Spirit of Juniper Wine 4 ounces. Mix them and stir them upon the coals, till the Spirit be wasted; then add Oil of Chamæmil, Linseed, each 2 drachms, Oil of Amber 1 drachm. Mix them, make an Unguent, wherewith anoint the neck. ¶ It is very good to hold the bone of a Pheasant's wing a while in the hand on that side, where the Convulsion is.

Joh. Agricola.

2. Castor is the most secure, ready and effectual Remedy of all. ¶ Goat's-piss also drunk with water fasting is very good. ¶ Also if you take equal parts of Castor, White-Pepper, and Parsly, and beat them together, and take them in a Spoonfull of Honey, and two or three spoonfulls of Water fasting. It is an excellent remedy for them that have the Convulsion backwards, and has been tried by often experience.

Donat. ab Altomari.

Jul. Cels. Claudinus.

3. In a Convulsion from repletion, a drachm or two of *Confectio Anacardina* is commended above all other things, if a Fever be to be raised. ¶ Take a fat live Goose, draw her, let a Cat cut small (some add an Eel also) old Bacon, Myrrhe, Time, Elder and Capital herbs be sowed in her belly, then let her be roasted; and let the second fat that drops be kept for an Ointment.

Crato.

4. This Unguent is good for the Cramp; Take of fresh Goose-grease 4 ounces, Oil of Cloves half a scruple, of Cinnamon 5 grains. Mix them.

Claud. Deodatus.

5. Oil or Spirit of Turpentine applied both inward and outward, takes away all Cramps and Convulsions, with which the Spine, the Navel, and the other parts affected must be anointed. ¶ Water-Lily with red and white flowers, dried in the shade, and hung on the bed, or the wall, in a moment of time cures all Convulsions, as *Carichterius* testifies.

Roderic. a Fonfeca.

6. Take old Treacle, Conserve of Rue each 2 drachms, Oil of Box 10 grains. Make an Electuary; The dose is a small Pill twice a day. It is a very profitable Medicine, which has a Specifick quality; and Oil of Box has a great prerogative in this disease; yea, and you may anoint the beginning of the Spine, the Temples and the Wrist with the same Oil.

Kircherus.

7. I learned of an excellent Swimmer, that Beetles were admirable good for Cramps and Convulsions, who always anointed his nervous parts with Oil of Beetles.

Berch. Penotus.

8. Take of Oil of Amber half an ounce, Mucilage of Briony what is sufficient, Oil of Cloves 6 grains. Mix them, anoint the place, with the root of its Nerve, and it will presently be dissolved, repeat it, and presently wrap the part in a Wether's Skin new slain.

Sennertus.

9. Among Topical Medicines, Oil or Balsam of Galbanum is an excellent one. ¶ A Weezle roasted in the belly of a Goose, as the Cat was, is good. ¶ Sulphureous Bathes are good. ¶ This Electuary is highly commended; Take of Castor, *Sagapenum*, *Opoponax* each 1 drachm, *Succus Cyreniacus* 1 drachm and an half, *Acorus*, *Scordium*, each 2 drachms, three Peppers, *Schænanth*, *Caroway*, each 2 drachms, *Asarum*, a roasted Squill, each 1 drachm, Juice of *Stachas Arabica* 1 ounce, Honey what is sufficient, let, what ought, be beaten, and mixt with Honey of Rosemary. Make an Electuary. The dose is half a drachm in Mede.

10. The following Powder leaves a wonderfull effect; Take of the Root of Swallow-wort, Devils-bit,

Elecampane, *Pœony*, *Mace*, *Cloves*, each 1 drachm and an half, *Bay-berries* half a drachm, *Rosemary-flowers*, *Sage*, *Mother of Time* each 15 grains, *Spec. Pleres archon*, *Diamoschi dulcis*, *Diambr.* each half a Scruple. Make a Powder. The dose 1 drachm, with Water of *Pœony*, *Black Cherries* each 1 ounce and an half.

August. Thonerus.

11. For a Convulsion arising from the Head-ach, I applied this wonderfull, efficacious and most useful Ointment, often tried by me in such cases, which I have ever found sure in a *Tetanus*, and in contractions of the Nerves; Take of old Oil 4 pounds, *Betony*, *Elder*, *Sage*, each 1 handfull, *Roots of Marshmallow*, *Acorus Aristolochia rotunda*, each 1 ounce, *Earth-worms* washed in Wine 3 ounces, *Opoponax*, *Castor*, each 3 drachms, *Flowers of Rosemary Stachas*, each 1 Pugil, *Red-Wine* half a pound, *Juice of Sage*, *Betony*, each 2 ounces. Let all boil to the consumption of the Wine and Juices. Strain and press it hard. Add of Fat of a Bull, a Duck, each 2 ounces, the Marrow of a Calf's-Leg 4 ounces, *Mucilage of Fœnugreek* 3 ounces, of both the *Stachas's*, *Nutmeg*, *Cloves*, each 2 drachms, Wax what is sufficient. Mix them, make an Unguent, which I ordered to be applied hot over the Neck.

Franc. Valeriola.

12. This is an incomparable Cataplasim; Take of Root of Marshmallow, *Bryony* fresh, each 2 ounces, *Mandrake* 1 ounce, *Leaves of Green Henbane*, *Mallows*, each 1 handfull. Boil them in Milk. To them mixed add of Linseed, *Psyllium*, and Quince-seed, each half an ounce, the Fat of a Dog, a Goose, each 1 ounce, Oil of sweet Almonds, fresh-Butter, each half an ounce, *Bay-berries* 2 drachms, *Saffron* half a drachm. Make a Cataplasim.

Arnold. Weikardus.

Cordis Affectus, or, Diseases of the Heart.

(See Palpitation, Book 14. Swooning, Book 17. and Book 19. Cordials.)

The Contents.

In the Cure of a hot disease hot Medicines are convenient. I. The Cure of Worms in the Heart. II. A Medicine.

I. **A**Lthough in cold Diseases of the Heart, Hot things are absolutely convenient; yet in hot Diseases simply Cold things are no way expedient, but things remissly hot. The reason is, because when we would change the hot complexion, we are not content with coolers, by reason the substance of the Heart consists of innate heat, which must not be extinguished, but corroborated. And therefore for the present the conservation of strength is principally respected, Because the Heart is the Workhouse of life and heat. Therefore, although in respect of a cold disease, hot things be indicated, nevertheless, in respect of the part affected, moderate, and not excessive Heaters are requisite. And for this reason Cordial Medicines, though they be hot, must never be neglected in Diseases of the heart.

Conciliator Enucleatus. Sed. 196.

II. Without doubt Worms are bred in the heart and in its Caul. This Disease is very familiar to Virgins, and is known by prickings and pains of the heart, and by Worms voided and not voided. Convulsion is the Diagnostick. Common Cordials, whether hot or cold, can doe little or nothing in the Cure. In the beginning, before there be Convulsions, *Beggar-Stone* may doe something, if it be given with

with Salt of Tanſie, or of Dittany of *Crete*, or the common, from 4 grains to 8. The Specifick Cure is ſuch. Let the Worms be firſt purged away with this; Take of Quickſilver purified, and then mor- tified with faſting-spittle, or juice of a Lemon, a- bout a Scruple, Conſerve of Roſes half an ounce, powder of *Benzoin* 2 grains. But if any Man be a- fraid to take this, let him onely infuſe 1 drachm or 2 in cold water over night, and pour it off next morning and drink it; or let him take 2 or 3 ounces of diſtilled-water of Onions, or Garlick: for theſe things, if they expell not the Worms, kill them at leaſt. And when the Worms are voided, if the Convulſion-fits return (which is a moſt certain ſign of a Worm in the heart) let Specifick Extracts be given, as of Garlick, Horſe-radish, Water-Creſſes,

of each 1 Scruple, in ſome Broth or Pottage, where- in Horſe-radish has been ſteeped before. By this method they are quickly cured. If extracts be not at hand, let a like quantity of all the Juices be mixt together, and 2 or 3 ſpoonfulls be taken every morning. And their Salts rightly prepared doe the ſame thing.

Hartmannus
P. Chymicus
c. 111.

*A Medicine eſpecially made uſe of by an eminent
Phyſician.*

Take ſome Juice of Garlick, Horſe-radish, and Water-Creſſes, give it, and the Patient will preſent- ly be cured; Believe one that has experienced it, it is true.

A GUIDE TO The Practical Physician.

BOOK IV.

Of Diseases beginning with the Letter D.

Deglutitio læsa, or, *The Swallowing hurt.*

The Contents.

The cure of strange things swallowed, either sticking in the Oesophagus, or get into the Stomach. I.

The Oesophagus freed from obstruction. II.

One that could not swallow, sustained by Injections in at the Mouth. III.

The Cure of it hurt by the ulcerated Jaws. IV.

When a Pipe may be used to get down Food, that cannot otherwise pass. V.

I. **W**HAT things contrary to nature are swallowed, either come into the Stomach, or stick in the Oesophagus. This is an Instance of the former. A

Maid eighteen years old, as she was eating, swallowed a brass Pin, with the Point downwards, which sticking in the Oesophagus, created cruel Pain. When she had tried several things, and continued a whole year in this Condition, the Pin was by my advice thrust into her Stomach with a Shoemaker's Wax candle, thrusting it gently twice or thrice a day, and anointing it first with Oil of sweet Almonds, which was done without pain, and quickly after it got into the Stomach: It has given no more trouble as yet.

A Woman, as she was cheapning goods, held a Farthing in her mouth, and having forgot it, as she was eating a peice of Cake that was offered her, she swallowed it before she was aware. Then she had a dull pain and Copperish taste in her stomach. I being consulted, because for some reasons I would not give her a Vomit, ordered her constantly to use

slippery and fat things, and gave her from six to nine drops of rectified Spirit of Salt twice a day, so that by little and little the ill taste was abated, and in a while the sad sensation ceased. Here it happened, as Theophrastus, in his Book of Fire, speaks, pag. 142. *That the Stomach melts money.* And acid Spirits are not so hurtfull to the Stomach; but they lessen the weight of Brass and Silver, by getting out their Vitriol, so that afterwards they may pass the Guts more easily.

A Boy of twelve years of age swallowed an Imperial Spanish Half-crown, that he had in his mouth, which stuck in his throat, the Chirurgeon tried as much as he could to get it out, but all in vain; so that he was forced to drive it into his Stomach; which being done not without much trouble, care was taken of the Oesophagus, which was pained and almost wounded, by giving Traumaticks and Paregoricks. The Patient in the mean time, as soon as the money was received into his Stomach, was very well, onely he had a pain in his throat, and swallowed with difficulty; nor has he found any trouble to this day, the Silver having remained now nine years fixt in its place.

A Boy three years old, when he had put two Links of a brass Chain an inch long in his mouth, swallowed them unawares, and as they stuck in his throat he roared out for pain; but as soon as they were got into his stomach, he seemed to all nothing, but ate and drank heartily. His carefull Parents searched the excrements every day for several weeks, but in vain; for they found nothing, so they certainly concluded, they were by little and little wasted in the stomach. But the excrements were never observed to recede from their natural state. The Boy lives now very well in health.

A Boy five years old, when he had swallowed a leaden Seal, that uses to be fastned to Cloth, was troubled with grievous pain till it got into his stomach;

G. Wolf.
Wedelius,
Mifc. cur.
an. 1672.
obf. 141.

mach; and was cured by giving him distilled Vinegar, whereas at first his Parents were afraid of his life; yet nothing of so broad and thick a piece could be observed to be voided; but he is now very well. And it was the best advice to give him distilled Vinegar, because by dissolving the body of Saturn it turned it into Sugar.

Riverius,
cent. 3.
obf. 71.

II. One being very hungry, was eating a boiled Hog's-foot, and a piece of it with the bone stuck in his throat for two days. A Chirurgion turned a long piece of iron Wire like a Hook at the end, put it down his throat, by the Hook whereof the piece of the foot was caught, and with main strength drawn out of his throat.

Idem, cent. 3.
obf. 72.

III. A man being taken with a true Quinsy, had the upper orifice of his stomach so close shut with the Inflammation, that he could swallow nothing at all. While Remedies were using, that he might be able to bear plentiful Bloud-letting and other Remedies, for reparation of strength a Catheter was put into the Oesophagus, and a Syringe fitted to it, by which Broths were got into his stomach, and Medicines also, by help whereof he was cured of his Disease.

IV. One asked my advice, saying he was troubled with Wolves in his Nose. (Flanders calls Snot concrete in the Nostrils, Wolves, which Nurses take out of Children with Pins heads) and moreover, that he had some pain in his Jaws, which reached to the middle of his left Ear, and that he swallowed Wine with pain. I told him, I thought, he had an Ulcer in his Throat, and we must take more care of that than of his Nose; and when I opened his Jaws with a Speculum oris, I observed all his Palate, and great part of the Uvula hugely ulcerated. That the pain of his Ear depended on this, no man, that knows Anatomy, can be ignorant. The Ulcer of his Jaws being first cleansed with Fallopius his Water, and he thinking he was not cured fast enough, D. D. Nollens promised him a most secret Remedy presently, and applied distilled Butter of Antimony. I found this at the first view, because upon the least touch of the Liqueur it turned into a Powder as white as Snow. Truly this hath great virtue in Venereal Ulcers, Rotten Bones, and the like, and cures in a short time, as it here appeared.

Heers,
obf. 28.

V. When Patients cannot swallow, a Pipe must be put down the throat, that they may take some food. But when there is an Inflammation in the part, it is too much irritated; therefore it is my advice, not to use the Pipe but on urgent necessity. I should rather approve that some sort of Pipe might be made which may be put near the throat, and also a clean Bladder full of some nourishing Drink, which may be fastened to the Pipe, and the Bladder squeezed with some violence, as in giving Clysters, that so the Drink may be forced into the Oesophagus. I have seen some restored by this Pipe who have been despaired of as starved. See Angina.

II. A Girl, near Xeres de Guadiana, twelve years old, fell into a Raving, which, after she had voided Worms, suddenly ceased.

A Medicine especially made use of by an eminent Physician.

I have found by most faithfull experience, that many who could not sleep for Raving, have found benefit by anointing with cold Oil of Violets, and applying an Oxyrrhodinum upon it.

Mercatus;

Dentium affectus, or, Diseases of the Teeth.

The Contents.

- The Tooth-ach must not be cured one way alone. I.
Its Cause usually gives place onely to Purgings. II.
It is often exasperated with hot things. III.
Whether we may use Narcoticks in the Tooth-ach caused by a Vapour? IV.
To ease it, where Causticks and Intericiptions should be applied? V.
A periodical one cured by burning the Vessel that conveys the Humour. VI.
A Tooth-ach that precedes the coming of the genuine Teeth, how it may be cured? VII.
Repellents are not always proper. VIII.
Death upon putting a Narcotick in a rotten aking Tooth. IX.
Cured by opening a Vein in the Palate. X.
The efficacy of opening the Artery of the Antitragus in a violent Tooth-ach. XI.
Cured by cauterizing the Cartilage of the Ear. XII.
The Tooth-ach cured by opening the Saphoena. XIII.
The use of Oil of Vitriol to preserve the Teeth from rottenness. XIV.
With what a rotten Tooth should be stopp'd? XV.
Whether rotten Teeth should be pulled out? XVI.
Whether they may be burnt with a Cautery? XVII.
The Correction of Rottenness. XVIII.
Loose ones must be fastned with Fire. XIX.
Over-long Teeth, that are not fast, may be fastned by cutting off what is superfluous. XX.
They must not be presently drawn. XXI.
Especially in Old men. XXII.
When they fall from Children, the Roots must be preserved. XXIII.
With what Cautions they must be drawn? XXIV.
Whether another can be put in the room of one that is pulled out? XXV.
Death caused by shortning a Tooth. XXVI.
A Fungus growing in the hole of a drawn Tooth, must be rooted out. XXVII.
Medicines.

Delirium, or, Raving.

The Contents.

- Cured by giving Meat. I.
Ceasing upon voiding Worms. II.
A Medicine.

I. MAdam N's Maid fell into a Delirium, so that she knew not what she said. Presently those that were by, thinking she was seized with some very grievous Disease, tried many things. But after she had taken some Meat, she was presently cured: for she confessed it proceeded onely from Fa-

I. THE Teeth ake, either because of a flatulent Spirit inclosed about the Roots of them, which is asswaged by a Decoction of hot Herbs in Wine; also by Treacle dissolved in Wine: Or because of a Defluxion of hot humours, where-with when cold ones are mixt, the pain indeed is not so violent, but has as it were certain intervals, yet it frequently returns. And this medly of humours (as it happens also in the Gout) is the reason, why the most approved Remedies do not so much mitigate as increase the Evil, unless the Physician know well the nature of the humours, whereby the pain is caused, and temper his Medicine according to the present affection. There is also another reason, because in this Disease, as in all others which come of Defluxions, those things that are

Q 2

good

good in the Increase, are good for nothing when the Defluxion is at the height, much less will they be convenient in the beginning. When the unskilfull observe this, their experiments often fail them (except they be Narcoticks, which ever take away pain, but never without hurt either of the part grieved, or of some one near it.)

Crato apud
Scholtizium,
conf. 75.

II. The Tooth-ach exercised me for several days, especially near dinner time, when the Stomach, being empty of meat, draws all the Juices from the rest of the Body on every hand, that can come. To ease it therefore, when I had taken a Purge, as soon as my Stomach was turned, I voided above a pound of Water, and that sincere and pure; so that I lived ten years after free from it. And being informed by this experiment, whoever complained to me afterwards of the Tooth-ach, I persuaded them to neglect those Remedies, People commonly wash their mouths withall, and first of all to take an Hydragogue, which always answered expectation.

Carolus Pi-
so, de collu-
vie serena,
l. 2. c. 3.

III. Medicines designed to cure the Tooth-ach, are most of them hot: but Practice shews that such pain comes from sharp bloud or a hot distillation. Therefore Physicians must go warily to work, lest being deceived by the common opinion, they create more trouble to the Patient by their hot Mouth-waters, than they procure ease of their pain.

Oethaus ap-
ud Schen-
kium.

IV. I think it by no means adviseable to use Narcoticks in the Tooth-ach, for the Vapour is too much congealed and thickned, and by congealing we doe no more, than turn a little ease into a more difficult Disease. But if an intolerable and immense pain torment the Patient, and the Physician be forced to comfort Nature with this sort of Remedy, I advise, that the Narcotick virtue be corrected by Heaters, and that at the same time we have respect both to the Symptome and the Cause, which may very well be done thus; Take of Pellitory of Spain, Pepper, each 1 scruple; Opium, half a scruple; tie them in a Rag; infuse them two or three hours in very sharp Vinegar, and apply them to the tooth. Or, Take of Henbane-seed, Staves-acre, Pellitory of Spain, each 1 scruple; Powder them very fine; Take one scruple of this Powder, and with the strongest Vinegar make it into a Pill, which may be held to the tooth an hours time. It wonderfully lays the pain indeed, and breeds no Intemperature, to speak on; though it were more desirible to take away the pain onely by Disscutients, if it could be done.

Flemus, Ph-
sographicæ,
c. 14.

V. In the upper Jaw an Artery creeps along the Antitragus of the Ear; where it may be burnt, and an astringent Plaster may be applied to this place and to the Temples, to intercept the flux of humours to the Veins: An Artery creeps nigh the Angle in the lower Jaw, and it must be burnt where it beats, or Topicks must be applied when the Teeth ake in the lower Jaw.

Riolanus,
Enchirid.
l. 4. c. 8.

VI. To cure and prevent a periodick Tooth-ach, Spigelius burnt that part of the Anthelix which immediately touches the upper part of the Tragus with good success, and then healed the wound again. By this new Chirurgery, that branch of the Carotid Artery that reaches from the Anthelix of the Ear to the Teeth, is cut athwart, so that the afflux of humours being intercepted, the pain returns no more. The Authoar tried the effect of this Remedy first in himself, and then in others.

Sculctetus,
Arm. Ch. r.
obs. 28.

VII. Those are the Genuine Teeth, which first appear before Pubescency and use of Venery in People; sometimes with cruel torture. A thing which the less observing Physicians neglect, and either pull out some other Teeth, or, persuading themselves that they are troubled with some fault in their humours, choak their Patients with Pills and such sort of Medicines; whenas no more present Remedy could be given the pained Parties, than a light scarification of the Gums upon the last tooth, and

sometimes a piercing of the bone. This very thing I now find true in my self, who in the six and twentieth year of my age, while I write these words, have my two and thirtieth tooth coming. And several Skuls which we meet with in Church yards argue the same, in which the latter teeth yet lye hid as in a Cave, and in some they are just piercing the most tender bone with their tops.

Vesalius, de
hum. corp.
f. 67. l. 1.
c. 2.

VIII. There is need of Caution in Repellents, especially if they be applied to the Jaws: for though if the matter fly back into the tooth, onely repellent Mouth-washes may be used without danger; yet if the matter be more plentifull, so that it possesses the Jaws also, Repellents cannot be applied safely, to the Jaws especially, seeing they may drive the matter inward to the Throat, and so choak the Patient. So Valsæ. de Tarenta relates, how one that was troubled with the Tooth-ach in his Grinders, and with a Swelling in his Jaw, had Oil of Roses and Vinegar applied to it, and fell into a Quinsey, and died.

Sennertus.

IX. A Senatour of Venice, because of the violence of his Tooth-ach, would cast himself a-sleep by putting in some Opiate Oil to the tooth: but instead of Sleep, he committed himself to his brother Death.

Alex. Bene-
dictus, l. 5.
c. 13.

X. Some have made mention of opening the outer Veins of the Palate in Diseases of the Head and Face, Jaws, Throat, Teeth and Mouth. J. à Reham. in Tascie. Med. wrote a History of a Woman, who had endured a bitter Tooth-ach, and she could find no ease in Repellents and other Medicines, she was wonderfully relieved by this Phlebotomy. And (saith he) these Veins are apparent, which yet must be opened after being bled in the Cephalick, and when the matter is digested, and not crude.

Severinus,
Med. Essic.
p. 56.

XI. Small Arteries go from the Carotides into the Auricle, the greatest of which creeps by the Antitragus and Anthelix, and ascending the upper Jaw, supplies every tooth with vital bloud, with which sharp humours flowing thither are often the cause of a most violent Tooth-ach, which I have often seen cured to a Wonder, by artificial cutting that branch in the Anthelix. Which is well observed also by Bauhinus: And Riolanus tells, how he saw a Man in Paris who got a great deal of money by curing that way: And I saw such an one in Gelderland.

Dilem-
breck, Ana.
l. 5. c. 13.

XII. Onely the Cartilage which is extended athwart the Ear, being cauterized, is wont to remove the Tooth-ach.

Lafrancus.

XIII. The Wife of N. of a sanguine complexion, and ruddy countenance, being troubled with a violent Tooth-ach, by the advice of a Physician of vlm, got her self let bloud in the foot, as the fate in hot water, suffering the bloud to run till she fainted, and she found ease.

August.
Thonerus,
obs. 5. l. 2.

XIV. Among all things which preserve the Teeth from Rottenness, Oil of Vitriol whitens the most, and is commended, if it be mixt with Water, because it hurts not the pure and sound flesh, but takes away onely the putrefied. Yet they find fault with it, who are ignorant of the true use of it: but they that know how to use it, give it successfully in great Diseases, though not in all; for a drop or two mixt with Sugar or Honey of Roses cleanses the teeth admirably, and helps putrid Gums, with Ulcers in the mouth.

Crato, conf.
75.

XV. A piece of meat, especially if it be sweet, if it be kept in a hollow tooth, putrefies, and so causes pain, or encreases the sink and erosion. Wherefore you will find it best both from reason and experience to fill a hollow tooth, lest ought get in, which may touch that sensible part. It may be filled with Mastick chewed till it be soft: for if hard things be put in, they will cause pain. Some fill their teeth with Wax; but in my judgment they doe ill, because it hath an emollient faculty, especially if it be new. But if we would use it, we must mix Salt or Alum; or something else that dries and

and binds, especially if the Tooth water; or white Wax rather, because it is drier, and hath an adstringent quality from its preparation; or, red Wax, which, by reason of the Cinnaber, prepares the teeth, so that they may be either more easily pulled out or broken: yet green Wax is more laudable; which dries vehemently because of the Verdigrease, Afterwards you must use other driers; lest such things as cleanse the teeth do at length fret them with their acrimony. If there be Putrefaction, add Myrrh, if Stink, Musk or Cotton wherein Musk is kept: except in such as are subject to the Head-ach, or Vertigo: because they are hurt by Smells.

Rondeletius,
l. 1. c. 83.

XVI. Ancient Physicians do not well agree about pulling out a tooth, although the most think a faulty and corrupt one should be pulled out. *Erasistratus* thinks they ought not upon a slight occasion be pulled out, and he produces this as a testimony for his opinion; Among the *Low-Dutch*, in *Apollo's Temple*, a leaden pair of Pliers to draw teeth was hung up, to intimate, that a tooth should not be pulled out, unless it were loose, so as it might be pulled out with a leaden pair of Pincers, that is, without violence. Which if in any part of it be rotten or faulty, what is faulty may be scraped off, and what is sound may be left. And, indeed, it must not lightly be pulled out, unless it be corrupt, all rotten and loose, if there be an Inflammation of the Nerve under it, on which danger may depend: for when the tooth is pulled out, the Nerve is free, and not pressed, but transpires and admits convenient Remedies. In corruption, you must consider how much it is, for sometime it is superficial and onely near the end; then some part of it may be filed off, while the root is sound. ¶ *Valescius de Taranta* doth scarce allow of drawing a tooth; first, because of chewing; secondly, because when one is pulled out, the defluxion goes to another, and so one tooth may be pulled out after another till a man have not a tooth in his head. But although he may be allowed his way in the Tooth-ach from a defluxion, where the matter flows by vessels common to several teeth: yet in corrupt teeth, and especially when the matter that runs out of the rotten teeth causes a Swelling or Ulcer in the Jaw, there is no other way of cure, but to draw the tooth: for then there is no fear, lest the adjoining tooth should be corrupted, because such corrosion comes not from a fresh defluxion, but from one that is past long ago.

Hollerius,
Perioche 5.

Sennertus.

XVII. *Hollerius* allows of Cauteries; *Sennertus* thinks the use of them scarce safe; because of the exquisite sense of the Nerves, fearing lest other parts should sympathize. Yet I could never observe any harm follow: the onely fear is, lest the parts adjoining, as the Lips, &c. should be burnt. With this Precaution a red hot Iron may be put in the hole safely: Let the Patient set his foot upon the Chirurgion's, and let him press it, that the Chirurgion may take away his Iron, if perchance it should hurt him.

Petrus Pa-
chequus,
Obs. 65.

XVIII. We see multitudes in this Climate tormented with the Tooth-ach, because of corroded and hollow teeth. I fill the hollow of the teeth with Turpentine, and then apply an actual Cautey, with very good success.

XIX. An Infirmary and looseness of teeth happens to many from a sharp distillation. All vulgar Physicians treat this evil onely with styptick things, which scarce doe any good. The onely Remedy is Fire, indicated by *Hippocrates*, l. de aff. n. 5. and by *Rhazes*, who burn the roots of the teeth with a hot Iron. *Gariopontus*, with a Copper Nail. What I see no man else doe, I have tried in two hundred, both curing the Tooth-ach and in fastning loose teeth. I will here shew the fashion of the Iron, which is fastned to a long handle, and is half an inch broad, and two inches long, but bent, so as it may be fitted exactly to the Convexity of the teeth. But it must be observed, that this Chirurgery may very opportunely be tried, when the parts first begin to languish,

but when the teeth are loosened from their roots, Burning will scarce doe any good.

Severinus,
Med. effe.
Pag. 250.

XX. Teeth, as the rest of the Bones, consist of small Fibres, but very hard and compact ones, running length-ways. By the insensible and extreme small Interstices of these small Fibres the most subtile particles of Aliment run from top to bottom, being carried by the Arteries to the roots of the teeth. If upon any occasion this alimentary Juice be made thinner, and its particles be carried with a greater impetuosity than they ought, they do not easily stick, but pass their bounds; and so when what is abated of the thickness of the tooth by continual effluvia, is not made up, the tooth must of necessity grow more slender, and when the Aliment runs out farther, according to the duct of the Fibres, the tooth grows in length. Therefore, to prevent this Slenderness of the tooth, the best Remedy is, to shorten the tooth with a File, so, when it is made shorter, the Aliment which cannot run beyond the tooth, being forced into a shorter space, encreases the thickness of the tooth. So Husbandmen use to lop the Branches of Trees that the Trunk may become thicker and stronger, the nutritious juice being contained within it self, which was distributed into the Boughs that were cut off. It seems as if this too great excursion of Aliment in the teeth might happen not onely because of its thinness and agitation of parts whereof it consists; but also through the laxity of Fibres, whereof the tooth consists; which may happen, if while the Aliment flows too sparingly, all the Fibres become more slender; or the same Aliment may be corrupted either through the fault of the part, or of the affluent humours.

Franc. Bayle,
Problemi. 57.

XXI. If teeth be loosened by a fall or blow, they must not be drawn, but restored, and tied to those that are fast, for in time they will be fastened in their holes: As I experienced in *Antonius de la Rue*, a Tailor, who had his Jaw broke with the Hilt of a Sword, and three of his teeth loosened, and well-nigh beaten out of their holes; when his Jaw was set, his teeth were restored to their places, and fastened with a double thred and a plaster to the next; I fed him with broths and spoon-meats; I made him astringent Gargarisms of Cypress-nuts, Myrtles and a little Alum boiled in Vinegar and Water, and ordered him to wash his mouth frequently; and I so ordered the matter, that, in a short time he could chew as Well with these teeth as with any of the rest.

Parvus,
l. 23. c. 67.

XXII. Two died of drawing a tooth, through much Bleeding: but one of them was decrepit: in the other there was a large Vessel at the root of the tooth, and a great Breach. ¶ As a Tooth-drawer was drawing a tooth from an old Man in the Market-place at *Bononia*, the man died suddenly.

Cardan. de
casib. &
sign. morb.
p. 155.
Forest. l. 14.
obs. 4.

XXIII. Teeth in Children, whether they fall out of themselves, or by violence, so the roots remain, grow again of themselves. Therefore we must have a care, when Children have broken their teeth by a fall or a blow, that we pull not out the part that remains; but the root it self must be as carefully preserved as may be: for all the hope of the tooth's coming again depends upon it, as the seed, and when it is pulled out by the root, teeth seldom or never come again.

Columbus,
l. 1. c. 10.

XXIV. We must have a care that we draw not a tooth at the time of a defluxion, head-ach, swelling of the Gums, or when they ake violently. And the Chirurgion must be admonished, that he pull it not out violently and forcibly, that is, at one pull, lest a great concussion of the Brain or breaking of the Jaw be occasioned, which is attended with a great Hemorrhage, or Fever, and sometimes Death.

Riverius,
praet. l. 6.
c. 1.

XXV. Some Physicians would persuade a Man, that an artificial tooth may be put in the room of one that is pulled out, and that it will stick as fast as any other tooth, that it will be clothed with the

flesh

flesh of the Gums, and will serve to chew with. But he that considers, the teeth have Life, that they receive Veins, Arteries and Nerves, that they are sensible and ake, and are fastened with ligaments; will never affirm it.

Riolanus,
Euchir.
l. 4. c. 8.

XXVI. A certain Nun, when she had got a tooth which was longer than any of the rest to be cut short, thereby to avoid the deformity, presently fell down dead in a Convulsion and Epilepsie: But a Nerve appeared in that part where the tooth was cut off.

Casp. Bar-
thol. Inst.
Anatom.

XXVII. A bony fungus sometimes grows out of the hole of a drawn tooth, so big, that it fills the mouth, and at last choaks a Man, unless prevented by cutting it out, and burning it.

Riolanus,
Euchir.
p. 309.

Medicines especially made use of by eminent Physicians.

I. For Rottenness of the teeth.

1. If the Corrosion come of Worms, a Medicine is made of Leek-seeds mixt with Wax, receiving the fume into the mouth.

Rod. à Fon-
teca.

2. This is a most excellent Remedy; Take of the Roots of Mastick-tree, Cinquefoil, sharp Dock, each 1 drachm; boil them in very sharp Vinegar to a third. Add to it strained of Salt half a drachm. Wash the teeth with it.

Petr. For-
estus.

3. A tooth taken out of a dead man's Jaw, if you touch a rotten tooth often with the root of it, will cause the tooth to fall out piece meal in a few days.

Hartman.

4. Take of Myrrh, Aloe Epatica, each 3 ounces; Henbane-seed, 2 ounces and a half; Nettle-seed, 1 ounce; Saffron, 2 ounces; Nutmeg, 1 ounce. Mix them; make a Powder; pour on it some Spirit of Wine; let it stand in a hot place for some days: then distill it by an Alembick, in which dissolve of Balsam of Sulphur a twelfth part, and you will have as excellent an Elixir as ever was used; where-with the Gums must once a-day be anointed. It is a most certain preservative of the teeth against Rottenness.

Joh. Popp-
us.

5. For the Hollowness of the teeth, if it proceed from a hot cause Camphire is excellent good, whether it be applied as a Plaster, or the hollow tooth be stopt with it.

Eustach.
Rus.

6. Take of Powder of Myrrh 2 scruples, Gum Juniper 1 scruple, Alume half a scruple, with a sufficient quantity of Honey; make it into a liniment, with which the rotten and hollow teeth must be rubbed every day. ¶ To get out hollow teeth some commend the fat and powder of green Frogs that live upon Trees, if it be rubbed on the teeth.

Dn. Sen-
netus.

II. For the Falling of them.

A tooth of a Man, who died through decay of strength, nor taken off by a violent death or an acute disease, causeth any tooth in a living Man to wither and fall out onely by touching it.

Van Hel-
mont.

III. For the Tooth-ach.

1. Take of Gum Tragacanth 2 drachms, Hyssop half an ounce, Pellitory of the Wall 3 ounces, mixt with Honey and Salt, and burnt to a Coal in a Pot, Pepper 4 ounces; beat them very fine, and pass them through a Sieve, and then use it; which if you doe, the teeth will neither ake nor grow loose, nor will the gums be inflamed or bleed, nor will Caruncles grow thereon, nor will they be troubled with defluxions. And, besides, the breath will be sweet and the teeth clean.

Aquarius.

2. Take of Juice of white Bryony-berries one pound and a half, Bark of the root of a Mulberry-tree an ounce and a half; boil half away. It must be held hot in the mouth; give it 7 days one after another. He that uses it shall never be troubled with the Tooth-ach. ¶ Take the Skin of an Adder, burn it and beat it, make it up with Oil about as thick as Honey; or, take the Skin it self unburnt,

rub the teeth therewith, and they will fall out.

¶ This is Andromachus his Medicine which asswages the Tooth-ach within an hour: Take of Pepper, Pellitory of Spain, Juice of Spurge, Galbanum, each equal parts; put it in the hollow tooth.

Aetius.

3. If the teeth be touched with the Radius of a Sea-parsnip, and the gums scarified, the Tooth-ach quickly ceases.

Jul. Caesar
Baricellus.

4. Some rub the teeth of Scorbutick persons with the branch of Willow, and set it in the smoak of the Chimney: and as the branch dries the teeth are cured. ¶ I have tried several Medicines, and could onely find benefit from Alume, which I melted in a Saucer and powdered, and with Nutmeg and a sufficient quantity of Honey, made it up into the form of a Liniment, wherewith now and then I anointed the aking tooth, and with good success, for the Tooth-ach ceased, and I rested well.

¶ A Pill of Philonium Romanum put in the tooth, having first washed the mouth with Lapis Prunellæ dissolved, never failed me.

Tho. Bartho-
linus.

5. Paulus writes that the Tooth-ach is effectually cured with a Decoction of Fern-root in very strong Vinegar. ¶ This is certainly experienced, that the root of Self-heal dried and rubbed on the Gums of the aking teeth till they bleed, cures the Tooth-ach.

Alex. Bene-
dictus.

6. One could find no ease by any remedy, till he put Betony in his Nose, and then he was cured. ¶ Shepherds-purse bruised, and the quantity of a Hazle-nut put in the ears, is a good and experienced remedy. Garlick also bruised, with a little Salt, and applied to the Thumbs, raises Blisters, out of which Water runs, whereby the Defluxion is derived from the teeth, and the Tooth-ach taken away.

¶ A Plaster of Burgundy Pitch with Powder of Nutmeg applied to the Temporal Artery hath cured several. ¶ Knives touched with a Load-stone, cure the Pains of teeth, ears and eyes, onely by the Touch.

Petrus Bo-
rellus.

7. Take Mastick-seeds and bruise them; put them in a Rag, and hold it to the inside of the teeth: It hath a wonderfull virtue of drawing out viscous humours, asswaging and at length of curing the Tooth-ach.

J. Theod.
de Bry.

8. In curing the Tooth-ach nothing is better than Oil of Turpentine, with Powder of Camphire; the Oil whereof also is very effectual.

Jul. Caf.
Claudinus.

9. Take some Pellitory of Spain powdered, half as much powder of Cloves, steep them in Spirit of Wine; wet a folded Rag in it, and apply it to the aking tooth. ¶ To preserve the teeth, the inner rind of Barbary steeped in Water, and to wash the mouth therein is very good in the morning. ¶ Also Spirit of Vitriol mixt with Water is very much commended, because it preserves the teeth from putrefaction, and whitens them. For a drop or two of Spirit of Vitriol mixt with Sugar or Honey of Roses cleanseth the teeth wonderfully, and helps putrid teeth and gums, and Ulcers of the mouth.

Joh. Crato.

10. Take Oil of Cloves half an ounce, dissolve in it of Camphire half a drachm, then add some Spirit of Turpentine four times rectified; mix them: A drop or two with a little Cotton put in the hollow tooth presently stops the Pain.

Osw. Croll-
us, Basichym.

11. The Salt of the fruit of the Fir-tree (which is called the first Stone of the Jovial-tree) is good for the Tooth-ach, if it be dissolved in a little Vinegar, and held a while in the mouth. ¶ Take of Wild-poppy, Hen-bane, Sweet-williams, Baum, each a like quantity; make of them a Crystal Salt; put a few grains of it in a hollow tooth. It is a certain Remedy.

Mich. Crug-
ner.

12. Take dried Hops, rub them a little, put them in strong Vinegar; boil them a little and strain them. Wash the mouth and gums with the Liqueur; for it is wonderfull.

Tob. Dorn-
crellius.

13. The Quintessence of Coloquintida is a great Secret in curing and easing the Tooth-ach. The Dose is half

Petr. Joh. Faber. is half a drachm or a drachm in some Broth or Syrup. ¶ The chymical Salt of Lizards cures the Tooth-ach admirably.

14. A Turnip roasted in the ashes, and applied hot behind the Ears is held for a Secret. Certainly it repels violently and cures the Tooth-ach effectually, as I have had experience, and can testify also of others.

15. Take the leg or thigh of a Toad, cleanse it from the flesh. Rub the aking teeth with the bone, and the Pain ceases in a moment.

16. The Tooth-ach vanishes when the *Archæus* is mortified, which is done by sharp Remedies, as the root of Pellitory of Spain, and of the Nettle with the red flower; the white substance whereof being scraped and applied to the tooth wonderfully mortifies its raging.

17. The Secret of the King of Poland. In a clear day powder a Load-stone, and calcine it in a glazed Pot till it wax green; Of this, with Meal, Wine and Gum Tragacanth, make Lozenges to put into the teeth, which in a moment stop their aking. ¶ Take a clove of Garlick, a little Treacle, a clean Cobweb. Mix them; make a Plaster; apply it for some hours to the median Vein, on that side the teeth ake on: the most violent Pain ceaseth, and returns not in some years.

18. If some Oil of Box in Cotton-wooll be put with a Probe into a hollow tooth, it presently takes away Pain.

19. Fill a Womans Thimble full of Salt of Ashe, and apply it to the temporal Arteries where you find them beat; in a short time it makes a knot in the Artery, whereby the flux is intercepted.

IV. For Looseness of teeth.

1. I have had frequent experience of this: Take Pomegranate flowers, unripe Galls, dried Roses and Spurge, with a little Alum; boil them in Vinegar and harsh Wine, till a third only remain. Hold the Decoction hot a long time in the mouth.

2. Take of Acorns 1 drachm, Galls half a drachm, burnt Alum, *Acacia*, each 2 scruples; Red-rose flowers 1 handful: Boil them in a quart of Red-wine: Let the teeth be often washed with this Decoction.

3. Pimpernel-root chewed fastens the teeth wonderfully.

V. For Black, Foul and Bleeding Teeth.

1. There is not a better remedy than a Pumice-stone red hot and quenched in White-wine twice, and the third time left till it be cold, and then without any farther quenching beaten and washed; If the teeth be rubbed therewith it makes them exceeding white.

2. Take of dried Rosemary powdered, White-bread powdered, each 2 drachms; red Coral prepared 1 drachm, Alabaster half a drachm; mix them; make a Powder, with which rub the teeth every day, and wash the mouth with Rosemary-water. In a short time you will find the admirable efficacy.

VI. For Drawing of teeth.

1. Dock-root heat in ashes, and continually applied to the tooth, draws it out in a short time. ¶ Also burn Earth-worms and powder them, and having scraped the tooth round about, strew it on plentifully, and in a day and a night it falls out of it self. Therefore use it confidently; for it is celebrated often as a Mystery.

2. Clear the tooth a little from its place with a Pen-knife, and then strew on it Powder of *Euphorbium*; For this, if any thing will, draws out bones. Or Juice of Spurge mixt with Meal may be put in the tooth, and the rest fenced with Wax: For Spurge-juice makes the teeth to swell. After 2 or 3 days the tooth will be so loose that you may take it out with your fingers, or with an Instrument easily.

3. To make the teeth fall, onely gut a Lizard and drie it, and touch the tooth or the hollow of it with the Powder, and it will presently drop out.

4. Take a grain of Mastick or Frankincense fit for the hole, stop it well, carry it day and night; but take it out in the morning, and wash the mouth with Water somethig salted, a Decoction of Sage or of burnt Harts horn. Put in another grain, and continue it so long, till the tooth fall out piece-meal; and this is done without any hurt.

5. Bastard Hellebore has a virtue beyond all other things to make teeth fall, if you rub them with a bruised leaf; but you must have a care what teeth you touch, for they will all fall out.

6. Gum of Ivy that grows on an Oak draws out any tooth. ¶ Some affirm, upon certain experiences, that if you take a Whelp 3 or 4 days old, and cut off his left Ear, and with the blood anoint the teeth; all that are anointed will fall out in the night.

Medicines.

I. ALL People write, that in the beginning of the Disease a Vein must be bled: But we must observe that when this Disease first appears to begin, it is in the State already. For when the Drink passes unaltered, the Veins of the whole Body and the Liver were emptied and dried up long before, but the Patients cannot know the beginning and encrease, because this Attraction is a natural work, and while it is performed onely in the Veins of the Liver, it is without any sense of Want, and therefore creates no trouble to the Body. And when it is in the state, all the serous humidity that is in the Veins, and was contained in the Liver and Stomach, is then consumed; otherwise there would neither be thirst, nor attraction of potulent matter unchanged. But in this case the Body is already thin and dry. And I think it not adviseable to let blood, when the Veins are already dried up. Nor let any man object, that when the Serum is evacuated, blood is left in the Veins: I confess some part of the blood is left; but where Serum is wanting, blood also must necessarily be wanting; for Serum is therefore mixt with the blood, that it may distribute the same into all the parts of the Body. Take away Serum, and you take away distribution; besides, since a great part of the blood is made of potulent matter, it is presently void what we drink by Urine, it cannot be turned into blood. Therefore in a true Diabetes Bloud-letting is never proper, whatever some men may say.

II. If

II. If salt Phlegm be contained in the Stomach, which being carried to the Reins increases the Disease; or if cholerick humours be carried to the Stomach, to the end they may be diverted from the Kidneys, a Vomit may be allowed, of Barley-water, with Radish-juice, Powder of *Asarum*, or the like. But, according to *Aëtius* his opinion, Vomit provoked by large drinking of Water immediately as it is drunk, is to no purpose: because sudden taking and rejecting onely cools and moistens the mouth of the Stomach, and can discharge nothing, nor can its virtue reach the Kidneys, the parts primarily affected.

Idem.

III. *Matthæus ix. ad Almanf.* fears the mildest Medicines, as Rose-juice, lest the sharp Juices at such a time should be attracted by the Kidneys, which attract strongly by virtue of the Medicine: But if a *Diabetes* be fed by a sharp and bilious humour, why are mild Purgers to be refused, which cannot put the Body in agitation, because mild ones will not do it? And provided they should, they ought not therefore to be rejected; for, according to *Galen*, *aphor. 24.* We do not use a Purge because of the Fever, (for we know on that score it will do hurt,) but because of the humours that cause it. Wherefore there must arise more benefit from evacuation of noxious humours, than there can detriment (which will necessarily follow) from purging Medicines.

IV. In an exquisite *Diabetes* caused by attraction of urine *Cassa* is proper according to *Capivaccius*. But *Matthæus Iradi* prefers a Clyster before a Purge. Yet *Capivaccius* says, it should not always be cooling. He holds that Tamarinds in a moderate quantity, without the Diuretick Powders, are proper. Manna and all Sweet things, that in hot Distempers turn into Bile, must be omitted, according to *Theodor. Baronius*, *de oper. mejendi, l. 2. c. 5.* He says, *Citrine Myrobalsans* bind up the Pores, and having loosened the Belly exasperate the Bowels, therefore the first time they are convenient is after perfect Concoction.

V. Revulsion and Purging premised, certain Diureticks, that are cold and moist, now and then absterfive ones are convenient. Such are chiefly Whey, in which, when there is need of absterfion, Barley, with Caper-bark and Bean-shells may be boiled. If there be need of greater absterfion, you may add also bitter Almonds, or Lupines, or Vetch; for they are strong Detensives. After Detensification the acrimony of the humour must be cooled and allayed. Some reject all things that provoke urine, cold as well as hot: But if the Kidneys be affected and imbued with a salt and sharp humour, how can it be, that the impacted matter should any way be carried off, unless we use things that provoke urine? *Galen* indeed, *13. method. cap. 12.* forbids them, when the Kidneys are affected; but he onely means thus much, that the humours which are elsewhere should not be carried to that place: But he no where teaches that the impacted humour should not be carried away by the same place. So a Vomit cures vomiting, raised by an humour impacted in the Stomach; so purging Stops a Loosness.

Saxonia,
Frel. pract.
part. 2. c. 33.

VI. The *Arabians* commend the use of Sweating Physick, that they may divert the matter from the Kidneys to the Habit of the Body. But this operation is suspected by me: for they would either carry into the habit of the body the Serosity then contained in the Liver, or the potent matter lately drank. Perfect Serum they cannot get out, for it is in the Veins, and they are dried up. It is not made in the Liver; therefore they will draw the potent matter unchanged. For the Serum is not retained in the Liver; and it is much worse for drink to be distributed unaltered into all the Veins and habit of the body, than presently to be carried off by urine. ¶ Lenitives, &c. being premised, some use to raise a Sweat in a Bath of warm water, though at this time it succeeds better in bed with bottles full of water. Now some give a Decoction of

Cinquefoyl and China: but I think it more advisable, after taking one drachm of Harts-horn philosophically prepared, according to *Paul*, that the Patient drink plentifully of cold water and presently be covered in a hot bed, applying bottles full of hot water to his sides.

Eortis, con-
sult. 1.
cent. 4.

VII. In a *Diabetes* the use of Narcoticks is wholesome, because it cools, thickens thin humours, hinders motion, causes sleep. *Aëtius* uses Narcoticks while the Disease increases; but it may not be amiss to give them when it is at the height, with what ought being premised.

Augenius,
Epi.

VIII. Astringents are good to bind the dilated Vessels, but onely in the progress of the Disease, and because the retentive faculty is also decayed. The *Arabians* use them without observing any distinction of time; yet they will do hurt in the beginning, while the Kidneys do as yet retain noxious matter, and because they increase driness, and the attractive faculty of the Kidneys: It is better then to use attenuating and moderately moist things.

Mercatus.

IX. Violent Astringents inward and outward must be avoided by reason of drying. ¶ For a Hædick may be feared. Too cold and astringent things upon the Spine hinder Transpiration.

Matth. de
Gradi.
Rondel.

X. If a *Diabetes* be produced by a volatile Salt, and that sharp, either applied outwards or taken inwards, or any way secred and existing in our body; certainly its cure will consist in the contemperation of the foresaid more sharp volatile Salt, both by oily things, as Emulsions of Barley, sweet Almonds, Seeds of white Poppy, Melon, Cucumber, &c. by sweet Milk of the Cow, Sheep, Goat, Woman, Ass, &c. And by Acids, but contempered with a volatile Salt, sweet Spirit of Salt, &c. mixing them with convenient Drink, Broths, &c. but not with the aforesaid Emulsions or Milk, because all sower things make them curdle.

Sylvius Ap-
pend.

XI. I believe the chief and most frequent cause of a *Diabetes* consists in the too much dissolved and lax mixture of the blood, and likewise scarcity and less than ought of urine, in a too strict consistency of blood. If the cause of this lax and dissolute consistency, which makes it apt to dissolve into Serum, be inquired, we say, the fusion of it, as also of Milk, proceeds from hence, because since in the mass of it Salts of divers natures meet and are associated, the rest of the particles being freed from the Salt ones (which keep them one from another, and contain them in mixtion) make a Separation. And it is plainly evident that Salino-fixt and volatile particles are always in the blood naturally, among which if at any time an acid Salt, or one that has obtain'd a fluidity, do come in a sufficient quantity, it will easily produce the aforesaid Disease. Hence it is, that *Rhenish* wine, &c. and acid Liqueurs, when they are drunk, provoke urine plentifully: for this reason also, Medicines, having a fixt or volatile Salt, use to move urine in some sickly People, whose blood abounds with an acid Salt. Astringent Medicines properly so called, namely, harsh, bitter and styptick ones, which by corrugating the fibres of the bowels, and by contracting them into a shorter space, do stop their expulsive and excretory faculty, and therefore hinder Purging upwards and downwards, although they use to be vulgarly prescribed, to hinder pissing, they do little or no good, because their virtue is able to do nothing in the mass of blood, and it reaches not the Kidneys or Bladder. Wherefore that it is to no purpose in a *Diabetes*, to prescribe the rind and flowers of Pomegranates, Medlars, Tormentil-roots and the like, as Reason dictates, so Experience confirms. But the things that are found to do most good, and square exactly enough with our Hypothesis, some of them are such as hinder the combinations of Salts, and consequently the fusion of Blood, such as those that are vulgarly called thickning Medicines, and have

have viscons and glutinous Particles, which being admitted into the mass of blood pertinaciously adhere to its active Particles, and fever them, and so hinder them from combining mutually among themselves, or with the Saline ones any other way in fusion: Other things dissolve the accretions of Salts; and therefore restore the mixture of the blood, such as Saline things of another nature which naturally stick to an acid Salt, and so recall it from the combinations it has entered into within the blood, such Medicines are they especially that are indued with a fixt Salt, and with a volatile and alkalizate one. Besides these two primary sorts of Ichureticks, there is another secondary one, namely, an Hypnotick, which by putting a stop to the animal Oeconomy, makes the vital Regiment to be performed more sedately, and therefore with less fusion of the blood, or precipitation of the serous and nutritious humour.

Willis.

XII. It sometimes proceeds from too much cooling of the Liver: And observe this, for no man, to my knowledge, has taken notice of it: Reason persuades it; for if a Dropsie be caused, why may not a Diabetes? When the Liver breeds Water, why may it not as well send it to the Kidneys as into the capacity of the Belly?

Saxonia.

XIII. I first cured my self of abundance of Urine, and then my young Daughter, and as many as came into my hands; when all died that fell into other hands, though they were reckoned famous men. And when, in the presence of some of them, I had almost cured one man in a day, who had been a month under cure and had found no benefit, but was well nigh dead, they admired. I abstained from Purgatives; they gave them. I abstained from fat things; they advised the use of them. I gave them Raisins; they consented; but they would not admit Lentils, but against their will. I used hot things; they cold. I applied Astringents to the Kidneys, they feared lest the Water violently stop, would flow back to the principal Bowels. I took away the Feather-bed; they forgot it. I often washed the Feet; and they neglected it. I gave White-wine; they said of right it was not proper. I forbade exercise after meat; I enjoined Sleep: they agreed with me only in these two rules.

Cardanus.

Capiuacius.

XIV. In a spurious one, by transmission, we must have a care of Coolers.

XV. It is worth remembrance concerning Quinces, which have a cooling and astringent faculty, how *Pascalius* in his *Praxis*, c. 50. writes, that *Alfonfus*, King of Naples, upon the use of them, fell into a Diabetes.

Saxonia.

XVI. A Bath of Sweet-water may be convenient, for it moistens the body, that is then dried, especially if it be indued with a cooling virtue: but a mineral one and of a drying faculty, by no means; for it would quickly bring the Patient into a Consumption, especially if he be of a hot constitution.

Idem.

XVII. A man thirty years of age after plentiful Drinking of Wine fell into a Diabetes, with most violent heat, extreme thirst, and so great a flux of urine, that he made thrice as much water as he drank by day as well as night. But after Blood-letting, and the frequent use of Tincture of Corals, Decoction of Plantain, and especially that mixture *Fr. Sylvius*, *Prax.* l. i. c. 30. § 183. hath to temper the volatility of the pancreatick Juice, within fifteen days the Disease abated. This is the Mixture, Take of Water of Plantain 3 ounces, Cinnamon, distilled Vinegar, each half an ounce; Syrup of Purflane 1 ounce, Powder of red Coral 1 drachm. Mix them. This Mixture may be given by spoonfuls. If any one would have it stronger, he may add to it half a scruple or a whole one of *Acacia*, or Juice of *Hypocistis*.

A. Herman-nus, commissarius, an. 1672. obs. 183.

XVIII. Medicines must be given presently, because it brings Men often into a Consumption, through the exceeding Heat of the whole Body,

especially of the Liver, Kidneys and Venous kind: I cured a Country fellow who was taken with it after a burning Fever, with Coolers and Moistners, adding Astringents and Strengtheners; among other things his whole Body was wrapt in a Plaster.

Knoblochius, in Aphor. p. 499.

Medicines especially made use of by eminent Physicians.

1. These are most effectual Trochiscs, which contain of the mucilage of Fleawort-seed, Coriander-seed prepared, burnt Ivory, Coral, Amber, Dragon's blood, Red-saunders, Flower, each two drachms; Camphire, half a drachm. Make it into Trochiscs, with the aforesaid mucilage, which may be given with Sheeps-milk, when the Butter is taken out.

Alex. Benedictus.

2. Take of Powder of red Roses, Myrtle, Bole-armenick, Mastick, red Coral, Dragon's blood, Shells of roasted Chestnuts, each 1 drachm and an half; Barley flower 1 pugil, Oil of Myrtle, unripe Olives and Mastick, each one drachm and an half; Powder of Myrobalans, Citrine, Chebuli and Indi, each 2 drachms, with Turpentine and Bird-lime of Mistleoe of the Oak what is sufficient; make a Plaster. It is admirable to stop and digest the serous matter.

M. Aur. Severinus.

3. There was a man cured several with these Trochiscs, and I cured a young man with them in four days who had a Diabetes, and pissed involuntarily in his bed. Take of Roses, burnt Ivory, each one drachm and an half; Seeds of Purslain, Coriander, Saunders, Berberies each 2 drachms; Camphire half a drachm. Mix them with the Juice of sowre Pomegranates. Make Trochiscs, every one of which may be of a drachm weight, and one may be given morning and evening mixt with Cold water and Syrup of Roses. It is a good and experienced Remedy for this Disease.

Arnold. Villanovus.

4. This Powder is very good. Take of Powder of a Hen's gizzard washed in Wine, a Hare's head burnt, Mastick, each half an ounce, Nutmeg, No. j. Bees, 5 drachms; Ashes of a burnt Hedge-hog, three drachms. Mix them. Make a Powder. The Dose is from half a drachm to a whole one.

Arnold. Weikardus.

Medicines.

I. **T**He Case which happened to *Stimargus his Wife*, who after the disturbance of her Belly for a few days, when she had taken great care to stop it, miscarried of a Child at four Months, and after she was cured of her Miscarriage, she swelled, teaches us how great danger there is in stopping a Loosness. This Woman must needs have gathered many and bad Excrements in the first months, whence it came to pass, that in the fourth month following she was taken with a Loosness, which much endangered her miscarriage; for unless it were stopt, there would be danger of abortion from the irritation of the Intestines that are next the womb, or from subtraction of nourishment from the child. And perhaps for fear of this, some Physician endeavoured all he could to stop it; and because her body was not purged, it thus happened; for the excrements were turned to the womb. But because there is no less danger, if it be not stopt before it go too far, we should in every Flux cautiously consider, whether we should promote it farther, or suffer it to run on. And the scopes in this consultation are the Benefit, the Ability to bear it, and the manner of its running: For if with benefit and ability to bear it, it run well, we may let it alone: But if it flow slowly, we may promote it. If without these things, we must stop it.

Vallesius,
l. 2. Epidem.
Sed. 2.

Saxonia.

II. In a Loosness we sometimes give Purgatives, for the discharge of the matter affixt to the Intestines, that irritates the expulsive faculty, but it is not prescribed for evacuation of the affluent matter; but abstain from Medicines offensive to Nature, lest the humours be carried from the Centre to the Circumference.

III. *Galen* *ad Glaucon*. 14. seems to have made a general rule that if a Flux be not so large as it ought, we must not meddle; saying that those who will do any thing, either let blood or purge, do cast their Patients into greater danger. I cannot acquiesce in this Axiome, but decide the matter by certain conclusions. The first is that a Flux truly symptomatick, though imperfect, must never be help: That is properly a symptomatick Flux, wherein matter is discharged, that causes not the disease, which is far different from the nature of the Disease; but when such things are voided as cause not the Disease, they help not the Disease, and strength is wasted. Hence *Galen* *aphor*. 47. *Excretions which help not the disease are always mortal*. And because for the most part such Excretions happen in the beginning of Diseases, hence it comes to pass that *Galen* in several places reckons Excretions then made, as useless, and pernicious, neither to be admitted nor promoted. But there is an excretion even in the beginnings, that is proportionate to the Disease, wherein such things are voided as ought; this is called symptomatick in respect of time, it is not such in respect of the matter voided; for such things are voided as ought. This therefore, if imperfect, must be holpen, according to *Galen* *Comment*. 5. 5. in 1 *Epidem*. in which place when he saw *Hippocrates* washed *Meton's* Head the fifth day, that he might help the blood which run imperfectly from his nostrils, he writes that by this example *Hippocrates* hath taught us, imperfect excretions may be helped even in the beginning, which Reason also persuades, drawn from *Galen* 1. *aph*. 23. *As quality to quality, so quantity must answer to quantity*. Therefore when such things are voided as ought, it must be helped by purging, if it be imperfect, though in the beginning. This is confirmed, if in the beginning we may carry off turgent matter, that matter is not onely turgent, which is moved to the places of excretion, and yet is no way carried off; but that also which tends to the places of excretion, and begins to be voided, but not so much as it ought; therefore it must surely be helped.

As for *Galen*, who forbids it, I say he forbade it, because in his time benign remedies, and such as were indued with an astringent faculty, were not found, which are granted us in this age, and may be safely administered. The third Conclusion is, if the excretion be critical, but imperfect, or be made on a chief critical day, with all the signs of a very good Crisis, then although it seem imperfect, nevertheless it must not be holpen: For it can scarce or not at all otherwise be, but that Nature, with all the signs of a very good Crisis, must make a perfect excretion upon a chief decretory day. But if it be not a principal decretory day, or there be not all the absolute and perfect signs of a Crisis, then we must consider whether there be any danger of the Flux of the matter to some principal part, which might either cause or increase an Inflammation; in which case even on a critical day, it is lawfull for us to help Nature: The reason is this, because when there are all the signs of a perfect Crisis, and at what time evacuation is made, Symptomes begin to encrease, it is a sign that more matter flows to some principal part; than to the ways of excretion, and therefore Nature must be helped. But if nothing urge, you may suffer the critical day to be over, and Nature may be helped the next, according to the advice of *Hippocrates* and *Galen*, 1. *Aphor*. 21.

IV. Although Bloodletting may seem formidable in this case, yet it is sometime proper when sharp bile is voided by stool, which is perpetually bred anew by the hot and dry intemperature of the Liver. ¶ If a Loosness happen with signs of abundance of Blood and strength, Bleeding may be celebrated in the beginning; but if there be a fever, blood may be taken away, though there appear no Ptethory. If there be a Flux, when there is a Plenitude or Cachymie in the common veins here is the difficulty; for first of all, all Astringents are suspected, because the Flux from a noble part to an ignoble one is prohibited, for the matter being restrained within the common veins, there is imminent danger of a Fever and Putrefaction. Secondly, Purgers hurt, because the Flux is more already than it should be, seeing it carries along with it the alimental matter, which is contained in the Stomach and intestines. Nor, Thirdly, are Vomits proper, First, because that matter, before it be drawn to the Stomach, comes to the Guts, which because weaker, will sooner receive the Fluxion than the Stomach: Secondly, it is not lawfull to carry such humours, through so sensible a place. In this fullness of the veins I should commend letting of Blood above all other things, First, because it carries off part of the matter together with the Blood, for all the humours are mixt together. Secondly, revulsion is made from the Intestines without danger, nor is the matter which is evacuated translated to another place, as in most revulsions. Thirdly, this letting of blood subdues the Cause increasing the humour, that flows to the Intestines; for in plenitude there is a hot and moist intemperature; but blood-letting cools and dries. Therefore *Galen* 7. *Method*. X. says, that in all Fluxes to the Stomach the body must be evacuated (that is by blood-letting, which he contradistinguishes from purging) or purged. And 5 *Method*. 3. in Fluxes of the Belly he says, for revulsion the humours must be carried to the Womb. Which is the very same thing that he taught 7 *Method*. 11. that sometimes Loosnesses come because of the suppression of the menses or hæmorrhoids, or loss of a Limb, or some excretion suppressed: In which case the cure of the Flux is to bring down the menses, open the hæmorrhoids, and quickly to procure the usual evacuation. Therefore *Avicenna* 16. 3. *traktat*. 2. *cap. de Diarrhoea ex vitio Lienis*, says, if there be need of blood-letting in this Diarrhoea, we must let it, and if it be lawfull in this, why not in a cholerick and melancholick one with a plenitude of the whole?

Saxonia.

V. *Mercurius*

Riverius.

V. *Mercurius Diaphoreticus* given for several days to 12 grains takes away all impurities of the body, which sometimes use to create stubborn Fluxes.

VI. Where a melancholick humour abounds, which is dry, astringents are altogether improper; for the noxious humour being thereby increased, affords matter for the Flux. Therefore we should rather treat it with thickeners and coolers. Which rule should not only be observed in this case, but in any other Flux, where there is suspicion of black Cholera. Into which opinion my observation forced me, which I had of a woman at *Vicenza* the last year, who being sick of a Dysentery and Fever, after she had been purged with boiled Whey, and the peccant matter had been diminished not a little by washing Clysters, when she came to astringents was evidently hurt by them: for besides that the Flux abated not at all, and the Fever was not a little exasperated, she had a sower taste so constantly in her mouth, that she complained more of it than of any other Symptom: Now I knew this happened, because she was of an atrabilious Complexion; Wherefore laying aside astringents altogether, and using thickening broths, and attenuating Medicines, not long after this the troublesome taste went out of her mouth, and the Flux and Fever at length left her, and the Woman was perfectly cured. *Hippocrates*, lib. 4. Acut. vers. 122. If the belly be moist and wasting, and the mind troubled, and the Patients scarce give answer to what they are asked, &c. which he says are melancholick things, then prescribes cold and thick fortifications, and stopping potions more viscid than astringent. These Potions as they must have no excess in their qualities, to the end they may repress the intense qualities of the humours, so in deriving the same humours to the urinary passages by their diuretick virtue, they stop the Flux at self; but astringents by their drying faculty render them sharper: And if they partake of black Cholera, promote the generation of them. Now things that provoke urine are most proper to cure Fluxes of the Belly, where there is no room for astringents. If viscid potions be proper, because they carry the humours to the passages of urine, then the use of Quinces, especially of their juice, seems proper; which, beside their astringent virtue, are so remarkably diuretick, that, as *Pascalius* in the 50th chap. of his method, testifies, *Alfonso King of Naples*, by the use of them fell into a Diabetes. ¶ But this distinction of things that stop a Loosness must be observed. Things that stop a Loosness are twofold, some do it with astringition, others without astringition by resisting the cause of the Loosness: As if the Belly be loose through the acrimony or Saltiness of the juices, exterline things by taking away what sticks to the Intestines, use to stop it, and fortifications that take off the edge from these qualities as thick things without taste, such as flower of several sorts: It by reason of burning Heat, whence come consuming Fluxes, Water cooled in Snow may stop it: If through multitude of juices flowing into the Belly, thence things that derive unto another part, as Diureticks: And Purgers also often stop a Flux, superfluity being plentifully evacuated, and the belly dried. These stop it by accident, which often cure with more safety than astringents, for here, where the matter is not evacuated, especially if it be malignant, they are very dangerous. ¶ A man robust and choleric was taken in the midst of Summer with a choleric Diarrhoea, very violent with extreme thirst. I prescribed him *Sal prunellæ* in his ordinary drink, as also in Juleps of Lettuce and Purslain-water, to be taken thrice a day, and he recovered in twenty four hours.

Prosper Martianus, comm. in loc.

Idem, ad vers. 128.

Vallesius, comm. in e-
suo locum.

Riverius.

VII. *Hippocrates* lib. 2. Epidem. Sect. 3. mentions a Loosness that troubled sick persons at a certain season, which could no way be stoppt, neither by food nor medicine, which rather seemed to be cured against reason, and in a manner by contrary means: because not many things, but moderate ones did

some people good, if they lay in a cold place with a bed under them. I guess this happened by chance to some sick persons, who while they were impatient of their disease, tossing themselves hither and thither, lying sometimes in Bed and sometimes out of it, went less to stool: Which seems contrary to all reason, because Cold ulcerates and bites, and is therefore apt to encrease a Loosness: But it does not this when it proceeds gradually, as in the case proposed, by reason of the manner after which he used it. From these things we gather, that outward cooling applied gradually and gently to the whole body, tempers the inward heat, first of all by repulsion of a milder heat inwards, and then subsequently by the actual coldness of the Remedy itself. Wherefore as often as we cannot attain it by coolers taken inwardly; it must be procured by outward application of things that are actually cold. Which I think is an excellent remedy in a Loosness from colliquation.

Martianus, comm. in loc.

VIII. *Avicenna* hath written, that Narcoticks are very good, because they thicken the matter, and cool the part, cause sleep, and lay pain: yet we must not use them, unless necessity force us upon it, and it is urgent in a hot body, and a hot Air, and in a Flux from sharp matter: We mingle strengtheners with them, as Castor, Saffron and Xyloloe; wherefore *Philonium* is a laudable Medicine, the use of Opium otherwise is dangerous. *Avicenna* mentions one that died upon applying Opium below. This order in the using will create security; First, we must use it outwardly, Then we must put it in a suppository. And then, if the Disease get ground, by the mouth. ¶ The Son of D.N. after a tedious Tertian, was taken with a Loosness, so vehement, that within three days his strength was quite spent, and was in great hazard of his Life. When I was called, I prescribed a drachm of powdered Rheubarb, after which he was much worse. The day following, at the hour of sleep, I gave him a bolus of Mastick, and Terra Sigillata, each half a drachm, Laudanum 4 grains. His Loosness stopt, yet he slept not, the days following he went to stool only twice or thrice, and within a few days he was perfectly well.

Heurnius.

Riverius, cent. 3. cap. 20.

IX. When a Loosness is cured by the use of a Bath, it is cured by revulsion. For *Galen de rat. victus* §8. says, In them that have a great Loosness a Bath stops it: but they that have a costive body, must not be bathed: The reason is, because the Bath makes revulsion from the Centre of the Body. We have therefore several times cured old Loosnesses by the Bath, which many have given over for incurable. ¶ I was once taken with a choleric Loosness, having so great an acrimony, that it galled the Anus, and brought sharpness of Urine, part of the matter being translated to Urine: A bloody Flux was at hand. I went into a warm femicupe, and I was immediately cured. ¶ But there ought to be caution, lest the Cachochimy be too great to be drawn to the Circumference by the Bath: for the juices being melted, and the Intestines and vessels that reach thither loosened and moistened, the Belly will be looser.

Sanctorius.

Riverius.

X. We must not stop it rashly, for, as *Celsus* says, lib. 4. To be loose for a day is good for ones health, or for more, so there be no fever, and it stop within seven days, for the body is purged, and what would have done hurt, is beneficially discharged, but continuance is dangerous: for sometimes it causes the Gripes, and a Fever, and consumes the strength.

XI. If the Loosness come from the Brain, the stools are frothy, *Hippocr.* 7. 30. aphor. But we must not trust this sign alone, we must enquire farther, whether the Brain carry any marks of harm, if there be a Catarrh, Deafness, any remarkable heaviness or pain in the Head, inclination to sleep, especially if he go oftner to stool in the night than the day: for Phlegm may flow from the Brain, without wind mixt with it, which is the original of froth. Again humours contained in the Stomach and Guts, may admit a mixture of wind, and frothy excrements af-

ferward appear, but the head not hurt, which therefore must not be tired with Medicines.

XII. A certain man vomited after meal, at night also, sometimes a thinner, sometimes a thicker humour, his head ached and was heavy. It was thought that all this store of Phlegm came from the Brain; divers remedies were tried, and at length a Seton, but all in vain. When the Body was opened, a *Fistula* was found in his Stomach. In this case some make an Issue in the top of the head, which is a remedy as doleful as it is fruitless. The sick are not cured but consumed by it; and all indeed out of an inveterate error in opinion, that the Brain did daily fill it self with a phlegmatick liquor, and sometimes poured it into the stomach. But if the humours of the Brain took this course, an Issue in the crown of the Head could not stop it; for (as the common opinion says) the inner veins of the Brain send this humour, which these Issues do not reach, neither can they empty them nor reach them. If any one may be thought to have been cured by them, he might indeed suffer a vomiting or Loosness, but not to be imputed to the Brain.

Sneiderus,
l. de Concr.
Spec. p. 439.

XIII. It is difficult to cure a Loosness from matter contained in the Mesenterick Vessels; neither Vomits, nor Astringents, nor Diureticks, nor things that draw to the superficies of the body, are good for it. Not Vomits, for reasons before alledged. Not Astringents, for if bad and corrupt matter be already gathered about these veins, they will stop the Flux, and will raise either a swelling or some obstruction in the part: therefore 13 meth. 14. Astringents are forbid in the beginning of an Inflammation of the Liver, lest the humours being retained, the Inflammation should be encreased. Not Diureticks, which seems a Paradox, for Galen 5 meth. 3. and 13. meth. 11. teaches, that when the Intestines are out of order, the humours must be carried off by urine, and for aphor. ult. 4. Sect. 1. I take my reason for it from Galen. 7. meth. 11. who laying down the general method of curing Fluxes, teaches, That the humours must never be carried from parts of less moment to those of greater moment. Of the former sort are the Guts, which being large can bear the quantity and quality of humours, without any great trouble. Of the latter are the Liver, Veins, Kidneys, Bladder, all which having narrow passages, besides the filth and acrimony, are apt either to breed the Stone, or Ulcers, sharpness of Urine, or Strangury. And especially because the Guts themselves are a fit place for the purgation of the humours beyond the gibbous part of the Liver: Neither may these humours be drawn to the habit of the body, since they cannot pass thither but by the Liver and common Veins, parts of moment: Nor may the opinion of several be followed, who for revulsion apply Cupping-glasses to the parts where the Flux begins, although they be noble, as if the Flux begin at the Liver, to the Liver; if at the Spleen, to the Spleen; for so not onely the matter gathered there is retained there, but also new matter is drawn from the neighbouring places. What must be done therefore? Three things must be done. First of all the matter must be brought away by Clysters, or astringent Purgers. Secondly, if it be thin and hot, it must be thickened and cooled. Thirdly, the Diseases must be cured, whereby it was bred.

Saxonia.

XIV. The cure of a waisting Flux (which is when nature cannot retain the humours, for some weakness from the alteration of temperament) consists in the restitution of the temperament: so a draught of cold water has cured several that have been sick of heat; for whom walking in cool places, and cooling diet is good, without the use of Astringents: On the contrary they that labour under a cold intemperature, are benefited by strong wine and food high seasoned; by heating frictions and anointings; for whom also the use of astringents is hurtfull.

Mercatus.

XV. Whether in waisting Fluxes (as some famous

men have thought good) it be convenient to give purging Medicines indeed, but such as are apt to bind after evacuation, the *ratio medendi*, and a right method may inform us: For seeing by such Fluxes, it is not the superfluities that are brought away either from the humours or the solid parts; but it is either the humours themselves, or the solid parts, that are wasted, no man should by any means offer to purge; but onely ply the causes of Colliquation. For neither is Evacuation endeavoured by the Purge, proper for the colliquated matter, (since Nature brings that away of it self,) nor is it indicated by what is to be colliquated, since the onely indication to be taken in this Disease is that which hinders colliquation: Which Colliquation a Purge may not onely not hinder, but increase. And how dangerous this is, let them tell you, who boldly attempting it, have brought the sick into a dangerous condition.

P. Salus,
l. de febr.
pestilent. c. 24.

XVI. Nor yet in these Fluxes is the use of astringent medicines approved; because if that matter, which is squeezed out by colliquation, be altogether bad, and retained within the body of the sick, it may do more hurt when retained, than when voided: for beside, that by its gravity it would continually increase the Fever, so also by its retention it would get a worse quality; whereupon it would increase the Disease, or it might with ease take its way to the heart, or other principal parts. Wherefore the Evacuation of matter already bred, must be wholly left to Nature, and the Physician must do his utmost upon the causes of Colliquation.

Idem, ibid.

XVII. Among the several differences of Fluxes of the belly a virulent or poisonous Flux may be reckoned for one; which if it be treated the common way, all that are sick of it dye before you are aware. It differs from others not in *Specie*, or form, but onely in cause or manner; because the cause is poisonous, and the disease malignant. Therefore a diarrhoea, lenteria, dysenteria and hepatick Flux may be poisonous in genere, and in specie. For Galen 4. aphor. 21. making mention of a Flux that was abroad in his days, in time of the Plague, says, that the excrements were yellow and red, and at last black. In the cure the Flux it self must be observed, distinct from the poison. 2. The poison it self. In respect of this onely two remedies are necessary; Drawers to the Skin and Alteratives: Nothing is better than the former. 1. Because there is a due revulsion from within to without. 2. Because the poison is drawn to an ignoble part, that is the skin. It may be objected, if in curing of Fluxes there be indications taken from the matter, from the causes and affections, without the poison; if there be indications taken from the poison also, upon which must we fall first? Here we must consider the way and manner of the Flux: for if it be swift in motion, which the constitution will shew; and if besides it be malignant, we must straight oppose the poison: if it be chronical and less malignant, so as to give some truce, we must first satisfy the common scopes. Drawers either draw specifically, or by their heat: All the first are poisonous, which must be so corrected, that they may be fit to draw, not to corrupt the Body. Vescicatories draw by heat, which hold the first place; and they are convenient also in a colliquative, sharp and hot Flux. But the cause of the colliquation and heat must be enquired into: for in poison, beside the occult quality, there is a heating, colliquating and putrefactive quality, so that if the poison be not immediately got out, all things are given to no purpose. Therefore in a hot and colliquative Flux, so it be with malignity, we may use Vescicatories, Sinapisms, Baths of hot water, Frictions, Anointings, Cupping-glasses. Alteratives also act by an occult or manifest quality: The occult, some by heat, some by cold; where the fluent matter, the causes and the disease must be considered: if all of them conspire in heat, as you may observe for the most part in malignant Fluxes, you

Saxonia.

you must use cold Alexitericks, as Unicorn's horn, Hartshorn, Pearl, Bole Armenick, juice of Citron, &c. Observe, in malignant Fluxes there must be a great quantity of Medicines, and often repeated.

Willis.

XVIII. An inveterate *Diarrhoea* which often happens to Scorbutick persons, must by no means be stoppt with astringents, neither is it easily cured with alteratives, nor with any Antiscorbuticks. Spaw-waters, impregnated with Iron or Vitriol, are the best remedy for this disease: Next to these are medicinal or artificial Chalybeates, which doe much good. *Crocus Martis* well prepared may justly be preferred before all others.

Cappivaccius.

XIX. If a Loosness have a cough with it, we must abstain from astringents: But because Medicines do bind either by their thick or by their viscid substance, when there is a cough, astringents are used, that have a viscid substance, such as Wheat flower, Gum Tragacanth, Comfrey and Plantain.

Idem.

XX. When a man has got the Pox; and has a Loosness with it, then *Sassa*, *China*, and the new Antidotes are good; for then we must not desist from *Sassa*, because the disease depends on a venereal virulence. Such a receipt as this may be proper; Take of juice of Sow-thistle depurated 2 drachms, powder of *Sassa* 1 drachm, Gum Tragacanth half a drachm, *Spec. & santalis* half a drachm; mix them, make Bolus's. This Medicine alters the venereal virulence, and the Flux depending thereon: But because Sow-thistle and *Sassa* open and loosen, to correct the *Basis*, and especially the *Sassa*, we may mix half a drachm of *Spec. Trion Santal.* or *Tragac.*

Idem.

XXI. We must have a care of sweet things; for they, because cold and moist, make the matter more fluent and loose: Therefore they doe most hurt, when the Loosness comes from a hot matter in a hot body. Nor may we use things that have Vinegar in them, and we must especially abstain from that which is sharp, and from any quantity of it.

Fortis.

XXII. *Aristotle* 4. *Probl.* 18. thinks that *Venus* sometimes stops an old Loosness, and so think *Paulus* and *Ætius*. But it is not proper when there is a defect of innate heat.

G. Wolf, Wedelius.

XXIII. Whether do astringent meats taken first bind? Some alimentous astringents taken before meal bind the belly; but taken after meal loosen it, as may be gathered from the constriction of the Fibres: For when they are given before meal, the *Pylosus* is more strengthened; whereas after meal, by accident, the sides of the Stomach being straitned, it is made more lax: and this is particularly verified in Quinces. Whence also it is manifest, that astringent Medicines themselves cannot conveniently be given with meat. Moreover I have observed that by accident in persons of a more tender and lax texture, as to their Stomach and Guts, a styptick powder has caused a Loosness.

Medicines especially made use of by eminent Physicians.

Ætius.

1. Mulberries not ripe, but as yet sowre, dried in the Sun, then powdered and applied, and upon occasion given inwards, will make a great restringent Medicine for a Loosness, and may well be given to colliack persons, who have been long sick, in powder either with meat or drink.

Alex. Benedictus.

2. Old Cheese is a most effectual Remedy, boiled till all the saltness be out; they taste it first, then after it is boiled they dry it. A drachm weight stops a Flux wonderfully. ¶ Also the inner rind of a Chestnut-tree is highly commended, for it stops an old Flux. ¶ Among all Medicines Mastick is most commended, taken in juice of Quinces.

3. Many have been most easily cured by taking new Cows Milk frequently, with Yelks of Eggs dissolved in it. ¶ There is also a basket-bread,

wherewith Elder-seed is mixt, a drachm of which given in wine is highly commended. Also bread made of Rye flower with juice of Elder is very good for all Loosnesses.

Petrus Bo-rellus.

4. In a Flux of the Belly, that is very pertinacious, a most effectual remedy is propounded by *Avicenna*; and it is old salt cheese, which must be often washed and boiled, till it become altogether fresh. The dose is a drachm with juice of Quinces.

Cappivaccius.

5. One had a loosness 3 years, at last when he had eaten Grewel with Acorns in it, his Loosness was stoppt. And after the universal remedies I use to give with success 1 drachm of Plantain seed powdered in a rear Egg.

Forestus.

6. Take of Dragons blood, Frankincense, Mastick, Mummy, *Terra Sigillata*, each 1 drachm. Bole Armenick 1 drachm and an half, *Carab.* Blood-stone, each 1 drachm. Make a powder, it deserves commendation.

Grulingius.

7. This is of wonderfull Efficacy. Sugar of Roses dissolved in juice of Quinces and Plantain water, heat and strained, and given upon a fasting Stomach. ¶ This is of incredible efficacy; Take of Quinces, or Pears, or Dates, green, 1 pound, steep them in Vinegar and water; boil them, and add of Roses and Wormwood each 1 handfull, of Cumminseed baked and steeped in Vinegar, 3 drachms. Make a decoction, and mash them together. Add of *Acacia*, Mastick, each half an ounce, Coral 1 ounce, Cloves, Spikenard, each 1 drachm, Oil of Roses, unripe Olives and Myrtle, each 2 ounces and an half, with 2 pounds of white Bread, or Bran, make a Cataplasma.

Lud. Mercatus.

8. A singular secret against the Flux of the Belly. Take some great and unripe Sloes, bruise them, strain out the juice, coagulate it upon the fire, till it be dry and become a kind of yellow powder. Give half a drachm of this in water of Sloes or Plantain.

Joh. Poppus.

9. Take of juice of spotted Arsmart, Houlleek, each 3 ounces. Boil them to a third part; they certainly cure a Loosness, though never so inveterate.

Riverius.

10. For a Loosness, let Pidgeons dung be dissolved in water of Fleawort or Willow; or let it be boiled in rain water, and the feet washed therewith. It is admirable and sure. ¶ Also the dung mixt with strong Vinegar, and laid upon the Navel, presently stops any Flux.

J. Dav. Rulandus.

11. Take a fat Turtle, pulled and drawn, wash her gently, put an ounce of new wax in her Belly, boil her in a sufficient quantity of Water. Eat her up, and drink the Broth. I found this to be truly salutiferous in one who had been a long time sick of a Loosness. ¶ This has been proved by often experience: Take a large quantity of Knot-grass, boil it in rain water. In this Decoction let the sick party set only the Soles of his feet, afterwards let him cover his feet with water, let this be done thrice a day for three days, continually increasing the water, till it cover his Knees. I have known several cured in this manner, and it may be tried without any inconvenience or danger.

Saxonia.

12. In a chylous Flux especially outward Medicines are of great efficacy, and are used with less danger; as a Plaster of Lupine meal, with oil of Nard, and the like.

Sennertus.

13. In any Flux and Pain of the Belly rain water, with Mastick boiled in it, taken warm is good. It is approved and certain.

Joh. Stokkerus.

14. The Liver of a Wolf, if a Spoonfull of it be taken in a morning, is an excellent Remedy.

Jacob. Sylvius.

15. Boil Knotgrass in Wine Vinegar; strain it, dip a double cloth in it, and apply it to the Stomach, Navel and Back. It is an experiment, that has helped many.

M. J. Wittichius.

 Medicines.

I. IN this age of ours men use to cure several
 aches and ails, making no distinction, with
 some cold thing, as Egg-water, which is cold and
 binding also, in both which qualities it is repug-
 nant to the Ulcer. For all things that ease pain
 should loosen; but the white of an Egg is altoget-
 her binding, wherefore both it and all cooling
 things seem inconvenient, and all hot things seem
 helpfull, beneficent, and allayers of Pain. *Fabius*
Columna had an angry swelling arose on the upper
 part of his thigh, much resembling a Carbuncle, and
 while I looked after it, when several times I had
 cut off the uneven *Callus* from the *Sinus*'s and the edges
 thereof, I assuaged the bitterness of the pain, which
 must of necessity attend the cutting, by no other
 means than applying hot bricks in a cloth, and using
 hot things. ¶ One, who had a cancrus Ulcer in
 his tongue, was so afflicted in the upper tuberosus
 part of it, that he could not speak a word, and
 when I had heat a silver spoon in the fire, and ap-
 plied it to the pained place, he was forthwith rid of
 his pain, and moreover could speak freely.

II. A Dwarf, about 40 years old, had undergone
 a most violent pain, for 2 months, in the lower part
 of the *Os sacrum*, whereupon he went mad. Several
 things were tried to no purpose. I applied one
 Cupping-glass to the pained place, and another a
 little below upon the Buttock, with deep scarifi-
 cations, which run much blood, which being wiped
 off, I applied the Cupping-glasses again upon the sca-
 rified places, and blood ran again plentifully. The
 Patient seemed rid of his Pain, yet the next day I
 ordered a great Causstick to be laid to the pained
 place, upon the very scarifications, and kept it there
 twenty four hours; so that there was a broad Eschar
 and to the very bone. After the Eschar was taken
 off, it was cicatrized, and the Patient eased of so
 great a trouble.

III. M. N. was suddenly taken with most sharp
 vagrant pains, that sometimes tormented his
 Thighs, sometimes his Knees, Legs and Feet,
 and sometimes his Loins. A Physician ordered five
 Pottingers of Blood to be taken from him in an
 hour, and his pain no whit abating, he gave him a
 Pill of *Laudanum*, which gave him ease till next day
 at noon. But then his pains returning as sharp as
 ever, I prescribe him a *Bolus* of *Diaprunum Solutivum*
 half an ounce, Jalap 1 scruple, to be taken even at
 night, which nevertheless he would have spent in
 most grievous torture: it wrought ten times suc-
 cessfully; for his pains were much abated, and quick-
 ly after quite gone. He was a melancholick man a-
 bout fifty; and had formerly been troubled with
 many passions of mind. Therefore I reckoned these
 pains came from a very sharp and thin ferous mat-
 ter, which was violently carried hither and thi-
 ther, and that it ought to be quickly carried off by
 a purge.

IV. *Fernelius*, cap. de *Arthrit.* writes, that the Gout
 in the shoulder is very painfull, yet that it neither
 swells so much, nor is so red or hot, as in the *Sciatica*.
 As I was upon a journey, and did not sufficiently
 guard my self from the raging cold, I experienced
 these pains. The pain was most violent, hindring
 the motion of my arm, as it were tying it with a
 string to my body. I used this Cataplasim, which
 did me good: Take of common Bole, Chalk, each
 1 ounce and an half, Oil of Roses 1 ounce, Vinegar
 of Roses 6 drachms, Cream what is sufficient; mix
 them upon Coals; add of Saffron 1 drachm; apply it
 hot with hempen Tow twice a day. Sometimes I
 added powder of Comfrey root and Oil of Chamæ-
 mil. You must observe that as the pain ceases, the
 Arm sometimes withers: Therefore convenient fo-
 mentations, unguents and Plasters must be used,
 wrapping it in a Hare's skin, &c.

V. One had a pain in his Heel so sharp, violent
 and continual, with a Fever, that he could take no
 rest, neither day nor night. His body was purged,
 and vomited for revulsion sake; he was bled in the
 Arm; all Anodynes were applied without success;
 the part affected could scarce be perceived to be
 swelled; for the thickness of the Skin. At length a
 potential Caustery was applied to the pained part,
 after some hours the Eschar was separated with
 a Razor, one drop or two of ichorous matter drop-
 ped out; The Ulcer was kept open for some days af-
 ter the fall of the Eschar, and powder of Precipi-
 tate was strowed upon it.

VI. Divers Pains and Tumours also, which are
 vulgarly ascribed to Defluxions, are produced by
 the effusion of the *Lympha* out of its vessels, that are
 distributed through the habit of the body, and ob-
 structed, and then broken: Among which they are not
 in the last place, which possess the upper part of the
 Arm to the Shoulder, and sometimes afflicth the Neck
 also: To which also may be referred those that stick
 in the hips, and counterfeit the *Sciatica* pain, and hin-
 der walking. Some of these pains will endure the parts
 affected to be covered with many cloths, and kept
 warm; others are exasperated with covering, there-
 fore they give way, and are cured with more diffi-
 culty than the former. They arise commonly from
 external cold, that pierces those parts, as they are
 in a sweat, and often lie bare in the night, and that,
 after Phlegm is coagulated in the Lymphatick Ves-
 sels, and an Obstruction, and then a breach made in
 them, produces according to the diversity of the
Lympha, divers Aches, and such as give place onely
 to various medicines. For a *Lympha* that is sharp,
 causes more gnawing pains, and such as yield onely
 to aromack Oils and Unguents. But one that is
 more briny salt, breeds pains that will not yield to
 aromack Oils and Unguents. The obstruction of
 these Vessels will be prevented by taking care that
 the Body grow not too hot; if this cannot be pre-
 vented, by having a care, lest by keeping the breast
 open it cool on a sudden, and by consequent the
 Phlegm that is in fusion, and diffused every way, be
 strongly concreted and coagulated in several Vessels,
 and therefore in the Lymphatick. The same ob-
 struction may be cured, if, as soon as ever these
 mentioned causes have obtained, and there is any
 fear that they have done any mischief, an attenua-
 tive and inciding Sudorifick be taken either all at
 once, or at several times. The Lymphatick vessels,
 when broken, will heal of themselves, after they
 are freed from obstruction, as we see it falls out in
 blood vessels, for the proper aliment of every part
 is indueed with a conglutinating faculty, because
 more or less tenacious and viscous. Aches arising
 in the Limbs, and especially in the upper part of the
 Arm, that are most troublesome at night, after the
 redundancy of the ferous humour, if there be any, is
 diminished by Hydragogues and Sudorificks also,
 may be taken away by anointing the part affected
 with the following liniment. Take of *Unguentum Mar-*
tium,

tatum, Oil of Worms each half an ounce, Oil of Amber 1 scruple. Mix them. But if the pain be increased either by this liniment or onely with clothing, we must use this following; Take of *Unguentum Populi Nervinum*, each 2 drachms, Oil of white Lilies 3 drachms. Mix them. But if the same pains affect the Hip, and have so seized the lower part of the Spine especially, that the Body can scarce be reared upright, and moved, *Balsamus Sulphuris Terebinthinatus* is most excellent, if the part affected be anointed with a few drops of it, with which in one night I have cured several miserable persons.

Fr. Sylvius.

VII. A Woman lay ill of a violent pain about her Hip, caused by a fall, anointing with Oils gave her no ease. By chance I had some Melilot Plaster ready, I ordered it to be spread on a cloth, and to be applied about night: in the morning she could rise, and sit at the Table, whereas before she was not in the least able to stir her self. I have several times applied the same to people that have got aches by a fall, and with success.

Thonerus, Observ.

VIII. When the same woman was troubled with a great pain about her shoulders, shooting through her whole right arm, caused by a deep scarification, the Knife being thrust deeper in than it ought, when other things would do her no good, she used this: Take of Oil of Earth-worms half an ounce, Badger's grease, Fox-grease, each 2 drachms. Mix them. Anoint the scarified places: And rub the arm with water distilled of Swallows and Castor hot.

When the same woman was tormented night and day with a violent pain in her right arm, beginning at her shoulder, and extending it self all over the arm with a swelling, and she could not lift it up; in a few days the pain and swelling were dissolved by the following means; Take of *Emplast. Diacaleit.* 1 ounce, Melilot half an ounce. Mix them. Spread then on a cloth.

A Maid being tormented with a pain in her right arm, was cured in one day with a Plaster of Gum *Tacanabaca*; as several others where the cause was not hot.

M. N. was tormented with an intense pain in her Loins caused by a Defluxion; Take the crum of a white loaf, steep in Cow's milk, then passed through a brais sieve, adding Yolks of Eggs, and fresh butter, and the following Oil; Take of Oil of Chamæmil, Dill, white Lilies, each 2 ounces, oil of Earth-worms 1 ounce and an half: Of which take what is sufficient for once, and apply it hot with a cloth. She presently found ease.

A Widow 70 years of age had a violent pain in her loins. Take of Ointment of Marshmallows, *Anodyn.* each 2 scruples, fat of a Rabbet 1 drachm and an half, Oil of Scorpions 2 drachms. Mix them. The pain presently ceased.

In Aches of the arms and feet I have often found fresh Cows dung with Oil of Roses doe good.

A Woman with Child was tormented with a kind of convulsive pain in her thighs. Take Oil of Swallows with Castor 1 ounce, Treacle water, Cephalick water, Spirit of Lily Convall, each 2 drachms. Mix them. Chafe it warm. She was quickly well.

A Woman was troubled with a racking pain in her right Arm, from her Shoulder to her Fingers ends, so that she cried out: Take Oil of Earth-worms half an ounce, Fat of a Man's Skull, of a Badger, each 2 drachms; mix them. She was quickly restored.

A Noble-man was cured of a chronical pain in his right arm by applying *Oxyroscum* Plaster, having used other things to no purpose.

Two great men who had been long afflicted with a violent pain in their Shoulders, were at last cured with this remedy; Take Soap, dissolve it in *Aqua vitae*, and apply it.

This cured a Woman of a violent pain in her feet; Take of *Unguent. Alabastr. Anod.* each half an

ounce, Oil of Worms 2 drachms, Camphire 2 grains; *Idem* mix them.

IX. In mitigating and driving away all pains of the nervous parts coming from a cold cause, and from Contusions, Balsam of Peru seems to have the prebeminence, because of its amicable and peculiar faculty in strengthening the Nerves, and dissolving any inherent matter. A woman, after a Palse in her left side, was tormented with a very bitter pain all over her Chine, and in the Knee and Toes of her left Leg, and had a kind of convulsive motion in them; but she was quite rid of her trouble in three or four times anointing. A Merchant was troubled with a very grievous *Sciatica*, and when other Ointments were in vain, he anointed the place affected with this Balsam hot, to his great comfort.

A Maid had pricked her right hand with a spindle, after the Chirurgion had cured the wound, she was much pained, and when other Ointments did no good, she was cured by anointing with this Balsam.

When I felt some trouble from a Contusion of my right Hand, which lasted above a month, it went away at thrice anointing.

Medicines especially made use of by eminent Physicians.

1. Fat and Marrow, if they be converted chymically into Oil, are accounted a present Remedy to ease pains. *Pet. Joh. Faber.*

2. An excellent Oil to allay all pains in children: Take Oil of Dill, Chamæmil, each 6 drachms, Rue, liquid *Styrax*, each 3 drachms, powder of Cummin-seed 1 drachm and an half. Let them boil up once. Strain it, and keep it for use, wherewith the pained place may be anointed. *Leon. Fabelius.*

3. *Sulphur vitrioli Anodynum* is an excellent Anodyne; Take of Hungarian Vitriol what is sufficient, boil it in distilled water for an hour, throw in pieces of plated Steel, boil it for an hour, so an excellent Sulphur will be extracted from the plates; brush it off with a brush into hot water, it may be repeated to a total extraction. Edulcorate this Sulphur with Rose-water, and keep it. The dose is three or four grains, with Syrup of Popies; it assuages all pain, and causes sleep. *Joh. Phlegmund. Rheum. melius.*

4. Take of the second rind of green Elder boughs scraped off with a Knife 1 handfull, boil it in sweet Oil with water, to the consumption of the water; when it is strained add a little Wax to it. Make an Ointment. It assuages all pain caused by Blisters, and is an excellent remedy. *Observ. Rivierio com. munit.*

5. *Lapis Prunelle* dissolved in some liquor, as in Nightshade water, is of great efficacy in assuaging any pains, whose true cause is inward or outward Inflammations. *Rollicke.*

6. *Sanctorius* in his Commentary upon *Avicenna*, for easing the most violent pains, when digesting Anodynes have been applied to no purpose before, touches the part pained with a Bladder full of cold water, quickly, and removes it again without any delay, and repeats this three or four times, and so he writes, the pains are eased.

 Medicines.

I. Letting of blood is called into question by many: 1. Because no mention is made of it either by Galen, or the Arabians. 2. Because when the Belly is loose, blood must not be taken away. 3. Left Cholera should grow fierce. But Trallianus and Aetius let blood, whom others follow, and deservedly; because when it is indicated and permitted, blood should be let. The Indication is, Blood offending either in substance, quantity or motion: The Permittent is strength to bear it. As to the Arguments, 1. The first concludes nothing. 2. Vallesius says, that Galen's Maxime, When the Belly is loose, &c. has killed more than it has cured: For when one evacuation is the cure of another evacuation, it should by all means be permitted; but not when it is critical. 3. Sharp and bilious humours forbid indeed a great quantity of blood, but not bleeding at all. Others reject Blood-letting, because bile rather offends than blood. 2. Because it conduces nothing to the cure of an Ulcer. 3. Because by watchings and fevers it farther casts down strength, which is already weak by often going to stool. 4. Because when the Belly is loose, it is not lawfull to let blood, according to Galen. But it is the opinion of the skilfull, when there is a Fever, and an

Fortis Conf.
26. cent. 2.

inflammation of the Intestines (accompanying the Ulcer for the most part) that blood should be let in the beginning of the disease, before the strength be any more wasted with the Flux; for by means of Phlebotomy the sharp humours and blood that run violently to the Intestines, are drawn back; and by it fear of an inflammation is removed, pain is eased, the Fever extinguished, the heat of the Liver abated, and the evil disposition removed. As to the contrary reasons, 1. Blood does not always offend as a principal cause, but ever as an assisting cause, and without which the Flux could not be, which faults Blood-letting helps. 2. Blood-letting draws away the humours that run to the ulcerated place. 3. It must be celebrated in the beginning before the strength be much wasted. 4. Blood-letting hurts some Fluxes, and any that has much spent a man; but this not at all, if performed in the beginning. ¶ Vallesius de Taranta says thus: A very old man had been miserably tormented with a Bloody flux for three months, and when I was called into consultation, I, contrary to the opinion of all the other Physicians, ordered him to be let blood, and he presently recovered. ¶ I. C. Claudius says he can safely swear, that in an epidemick Dysentery in his time, he saved several mens lives by this kind of remedy, and hastened their recovery.

II. They that suspect a Vomit, rely upon Hippocrates his opinion in Coacis, where he says, that in dysenterick persons choleric vomiting in the beginning is a grievous evil. But there he speaks of a spontaneous vomiting, which is bad indeed, because it is symptomatick, and denotes the disposition of a fierce humour, the notorious disorder of the Bowels, the weakness of the retentive faculty, and some hurt in the Stomach, which is co-affected: But a vomiting caused by art may be convenient, if the Patient have an inclination to vomit, and the humours stagnate in the Stomach; for revulsion is made from the part affected. Hippocrates himself, l. de affect. n. 2. advises vomiting, When, says he, you have purged the head, give a medicine in drink, which purges Phlegm upwards. ¶ Amatus follows him, centur. 2. curat. 44. in Scholio, where he says; If a Physician could retract upwards the bilious and sharp humour, that runs to the Intestines, and breeds the Bloody-Flux, and could evacuate it by vomit, doubtless it were a foolish thing, and contrary to Galen's rules, to carry the matter through the Intestines, which are full of Ulcers: But when the Physician is not able to attain this, yet he ought to endeavour it to his power, and consequently effect it by purging Medicines. ¶ Mercatus confirms this in these words; You must translate the humours to another place by blood-letting, purging and vomiting, especially in salt phlegm; for by this way I have seen long Dysenteries cured.

III. A young man twenty years of age, about the end of August, 1643. had been sick of a Bloody-flux for twenty days, which he had taken no care of by any Medicine, till being brought to an Hospital, he took, by the prescription of the Physician, a drachm of Salt of Vitriol dissolved in water: He vomited much phlegmatick and cholericke stuff, and so revulsion was made of the humour flowing to the Intestines, and he was cured by this onely remedy.

IV. Why should any man purge in a Dysentery? Will he not draw excrements to the part affected? Certainly he must. In the mean time therefore does he not doe harm? Undoubtedly; yet purging preserves many from a malignant Dysentery, timely carrying off great plenty of juices: Because the Guts are much more exulcerated, while the excrements flow to them by little and little, than when a great quantity runs through them at once. Therefore purging does not take away the danger, which is impending from the juices themselves, but what attends their tarrying and slow Flux. For this reason, if a purge must be given in a Dysentery, it must be done quickly, because when the disease is far gone, it will be undertaken in vain. Nor yet may we use this kind of cure in all Dysenteries, for it has something of rashness in it to call all the excrements

Riverius.

Vallesius, l.
2. Sect. 6.
Epidem.

crements to that place, whither, to the Man's great hurt, they flow of themselves; but then onely, when a malignant Dysentery is imminent, and when no other moderate cure, which is performed by deterfives and astringents, seems sufficient. ¶ What occasion there may be for Purging, I will tell you in short, Either there is in the Dysenterick person with a great Cacochymie no great exulceration: Or with a great exulceration, a small cacochymie: Or both the cacochymie and exulceration are small: Or both great. If the first, he should be Purged: If the second, not; but should take Diureticks, Sweats and Vomits, and the Ulcer should be cured by Topicks inward and outward: If the third, there is no need of Purging, nor much of local Medicines; but of a good diet, and some gentle evacuation and derivation. If the fourth, it is incurable; and you must either do nothing at all, or onely for trial's sake, as in a desperate case. For such cures have sometimes succeeded: Nor am I against that of Celsus; Oftentimes whom Reason could not help, Rashness has helped.

Idem.

V. If a Man be averse to Purging Medicines, or for some reason be willing to use them; yet the Flux must by no means be stopt presently: It is better for some days to wash the Guts with Broth of Fresh-meat, Capons, Hens, &c. to which may be added Oil Olive, or of Sweet-almonds, or fresh-Butter. Such Broths nourish much, wash and cleanse the Guts, and mitigate pain, with addition of the Yelk of an Egg or two. When the Patient has used these Broths four or five days, then he may have recourse to things that stop the Flux.

Hildanus, l.
de Dysent.
ris. c. 8.

VI. *Joh. Matthæus Faber*, among many learned observations, hath this one that deserves notice, That in long *Diarrheas* and *Dysenteries*, the Guts are made as thin as Cobwebs; wherefore, in the cure of such Symptoms, the time should be diligently attended: For in the beginning he thinks a Man may Purge with Rheubarb; but if the Flux have continued long, he thinks we should abstain from such dry Purgers. But if perchance a Physician, relying on that indication, will so perform the cure, Tamarinds and Syrup of Roses are sufficient for that; otherwise driness is increased, and disease added to disease.

VII. A Dysenterick Flux must not presently be suppressed, but the humour that cleaves to the intestines, and frets and exulcerates them, must be presently cleansed and evacuated, before the intestines be worse hurt, and a greater exulceration follow; which cannot be better done than by Rheubarb. Yet we must observe if the vitious humours be too much fermented, and in violent motion, and there be fear lest they be irritated by the gentlest lenitive, and should fall with more violence on the part affected, then Rheubarb does no good, but sometimes casts the sick persons into certain hazard.

Frid. Hoffmannus.

VIII. *Augenius* steeps Rheubarb in Plantain-water for a night, in the morning, after he has strained it gently, he throws away the Infusion, and gives the substance in Syrup of Roses, Whey, or the like, with good success: for so he says, the heat and attractive virtue of the Rheubarb are qualified. ¶ Rheubarb by vehement toasting loses all its Purgative virtue, and contracts an *Empyreuma*: But if you desire its more astringent virtue, you must make use of the part remaining after extraction of the Tincture, with Cichory or Plantain-water.

Idem.

IX. If the Dysentery be far gone, and there be a Fever, we must proceed cautiously in the use of Purgatives. Therefore 6 drachms of Cassia, with 3 drachms of Pulp of Tamarinds must be given presently, after which two pound of Goats-whey, prepared, must be given. Nor need we, with *Forestus*, fear the fowrness of the Tamarinds, as irritating the Ulcer, because it is restrained both by the

Cassia, and the Whey, as *Hernius* has considered, *Forst.* and in the mean time it binds and dries the Ulcer.

X. Some question whether *Cassia fistula* may be made use of to Purge withall? Some are against it, because it is lenitive and moist, and so fitter to increase the flux and the disease than to cure it. Besides, as *Mesues* writes, it hurts them that have weak Intestines: Moreover they add, that at this time there are safer Medicines. But we may expect several advantages from Cassia, which we cannot have from other things; for it is a lenitive Medicine, but not such an one, as makes the matter more liquid, for it voids the excrements hard. Besides, as *Mesues* says, it breaks the Acrimony and heat of the Bile and Blood, and their Inflammations, and it allwages the pain of the Inflammation: for there must always be an Inflammation, sometimes greater, sometimes less, because there is one in all Ulcers. And if Milk be commended by *Hippocrates* and *Galen*, this must needs doe much better, especially if we add any thing that dries, such as are Plantain-seeds, washed Hartshorn, and other things. Now it is said to hurt the Intestines, because it is moist and slippery, which does no harm in a Dysentery, in which, by reason of bile and acrimony, the Intestines are dried and parched; wherefore it may doe good, especially as it makes a fence for the Intestines, and by gently Purging cleanses the filth from the Ulcers: Which will succeed so much the better, if for drying up the Ulcers, we add drying Powders and Medicines, such as Syrup of Roses (you may put in Tamarinds, that are cold and dry) and the Cassia may be given in less quantity.

Rubeus in
Celsum.

XI. The Dysentery must be attributed both to the abundance and sharpness of bile (caused by the heat of the Air, as also a bilious *Diarrhoea* has for the most part its rise from thence) and to the sharpness of the pancreatick juice, caused partly by the too much use and abuse of the like things, and partly by the subsequent coldness of the Air in the Month of November. For in a Dysentery the Intestines are Ulcerated and fretted, and there is a plentiful excretion of blood, but especially of Pus: Therefore it must be produced by such a cause as is naturally apt to fret the Guts and cause an Ulcer; Therefore by a sharp humour. They are in an error therefore, that derive a Dysentery from Bile alone, what way soever corrupted or made sharper by it self: for after the lixivious Salt of the Bile is made extreme sharp, then indeed it will any where else, as well as in the small guts, cause a Gangrene, but never an Ulcer: for an Ulcer is an effect of an acid, not of a lixivial. Therefore, unless an acid and sharp humour be joined with the Bile, it will never cause a Dysentery, which onely an acid and sharp humour, falling upon the Intestines, can produce. Hence, because the abundance of this acid had its original, sometimes from acid Medicines used preposterously, and in too great quantity, sometimes from the extreme sharpness of the Air in the Month of November; these things conduced to its cure. 1. The avoiding of the cold and sharp air. 2. The use of Medicines, that concentre and soak up an Acid, as Coral, Pearl, Crabs eyes, Chalk; and for the quicker healing of the fretted Guts and Vessels, Dragons-bloud, Bloud-stone, &c. 3. The cleansing and healing of the fretted Guts, by Clysters made of Cows-milk, Venice Turpentine, Yelks of Eggs, and Honey of Roses, given frequently, and kept as long in the body, as conveniently they may, that they may doe the Patient the more good. For which purpose new Treacle, *Disfordium*, &c. may be made use of.

Sylvius, Ap-
pend. Tract.
10. Sect. 25. §.
772.

XII. In the opening of several Dysenterick persons, Blood has onely been observed in the thicker guts, and not in the smaller. And why onely in the thicker and not in the small? I believe for no other reason, than because the corroding humour

easily passes from the upper Intestines, wherefore no excoriation or corrosion can be caused there, as it happens in the thicker, especially in the Colon, where especially the morbidick humour stagnating because of its turnings, corrodes its coats unmeasurably. Therefore I judged absterfive Clysters, and Spaw-waters very good, and I found them so; with respect nevertheless to, and not neglecting the morbidick cause.

Panaeolus,
Fene. Labf
9.

XIII. In the Bloody-flux, many at the very first use Clysters of a boiled Sheep's-head, whereby, no doubt, the Ulcers grow foul, which makes them worse. It is better to begin with absterfives, and by degrees proceed to astringent and glutinous Medicines: for fat are made use of in respect only of a Symptome, that is, Pain. Galen takes notice of it 12 Meth. When the Stools in a Bloody-flux are very fretting, we give a Clyster of juice of Tragum, or Goat's Sewet, or Ointment of Roses; by which means certainly the exulceration in the Guts it self is not cured, especially if there be any thing putrid in them, but ease is given. And this is to oppose the Symptome and neglect the disease for a while. In which Discourse, not onely they are reprehended, that use mere fat things, but they that mix Goat's-sewet with other things, when there is no pain; and they also that think Sewet dries. ¶ Augerius Ferrerius Castigar. c. 25. reckons Yelks of Eggs among fat things, with which, and with fat things any Inflammation is increased. ¶ Crato in Analogismo gives a caution concerning Sewer, that no Physician ever use it without Oil.

Mercatus.

XIV. Astringent Clysters are not so safe as Potions, wherefore no man may rashly mix astringent things in Clysters; because by the use of them, the things that fret the Guts stick closer to them, and now and then make the exulceration and the Torment greater.

XV. In all fluxes of the Belly, much of the innate heat goes out with the excrements, whence it comes to pass, that the Stomach is cooled, and the concoctive faculty spoiled. Nor can it be doubted, but that in a Bloody-flux, by frequent injection of cooling Clysters, the Stomach also must be much cooled through its continuity with the Guts: Which thing the multitude of flatulencies and crudity of Excrements declare. Therefore the Ancients, in the Bloody-flux, added to their astringents, heating and concocting Medicines, as Wormwood, Mint, Castor, Mastick, &c. or such things as might preserve the innate heat from being extinguished with cold things.

Aug. Ferrerius.

XVI. As a hasty and over-much use of Astringents is hurtfull, the flux of the humours being unseasonably stoppt, and the body made costive, whence a perpetual costiveness and driness thereof usually remains; so a seasonable use of them is altogether necessary, to the end the rheumatick disposition remaining may be taken away, and the retentive faculty, the weakness whereof upholds the Flux, may be strengthened. But we must use them upon these conditions. 1. According to Crato's advice, before the seventh day they must neither be used inwardly nor outward, till the Ulcers of the Guts be first well cleansed. 2. Sometimes we must chuse cold things, sometimes hot, according to the nature of the Humour. 3. Coolers must be corrected with things that are hot and help concoction; for by the continual Flux the heat of the Stomach and Guts is diminished; the crudity of the excrements is a sign of it. 4. They must be given in a small dose, but often; first, lest the Flux should be staid too soon, and that the virtue of the Medicines may more easily be exerted by nature: Next, lest they should be washt away by the fluent humours, before they exert their virtue. 5. We must begin with the gentler and weaker sort, as Syrup of Quinces, or compound Marmalade of Quinces. Hartman says, we must observe in general, that no Flux must be stoppt on a sudden, except in a Phthisick or Peripneumony.

XVII. We must observe, not to use dry things too liberally in dysenterick Clysters, such as Dragon's-bloud, Coral, Trochisci albi Rhafis, and de Spodio, for they cause greater pain, and oftentimes a new Flux: But if any Man have a mind to use such things, let him chuse Unguentum album Rhafis, or Unguentum ex Pompholyge, or such things as are dry and clammy, as Bole Armenick, Terra Sigillata, Starch, &c.

Mercatus, de
Indicat. l. 1.
c. 31.

XVIII. Some put Opiates in dysenterick Clysters, but amiss; for Minadous, a Doctour of Padua observed, that all those, who by the advice of their Physicians, used opiate Clysters, died; The reason is, Because Ulcers of the Guts are rendred more putrid and filthy by Opiates.

Frid. Hofmannus, m.
m. l. 1. c. 10.

XIX. There be three degrees of deterfiv Clysters. The first is of such as are made of Wine and Honey, with Barly-water and Honey of Roses. 2. Of salt-water, with Sal Gem, and Honey of Roses. 3. Of Brine, adding some Egyptiacum also, if the Ulcer be foul and spreading. And although the use of Brine may be questioned, considering the example of that Physician, who cured all dysenteries by the use of Onions and Clysters of brine, and killed them with Convulsions, for he was without method: yet in a spreading and putrid Ulcer, not onely Brine, but even Causticks are convenient, as Galen advises 9 per Loca, if it be also callous. However Caution must be used in giving Brine and Causticks, with the observation namely of three conditions. 1. In full strength. 2. Not without Narcoticks mixt therewith, after Galen's manner. 3. That the Clysters be not kept above an hour, as Aetius advises.

Gal. 12.
Meth. 1.

XX. Concerning the use of all Clysters, we are wont to observe the abundance of their matter in deterfiv and washing ones, the smallness in drying ones, mediocrity in tempering ones, and shortness of time in Causticks: And then the successive use of them, so that a drier may always follow a deterfiv one, and then an Anodyne, if pains be urgent.

Foris, cons.
sult. 83. cent.
2.

XXI. This one thing, and that of great moment, must not be omitted, that sometimes dysenterick persons retain their excrements several days; both because Pain and Watching, Symptomes familiar to this Disease, dry extremely: and because astringent Medicines, which we make use of, to stop the Flux, render the Belly so costive, that the Excrements are retained a long time, to the great damage of the Patient, although the Belly void bloody matter often flowing from the Ulcer, which indeed has been observed by no man as yet. Wherefore, in this case, at certain intervals of time we must evacuate downwards, either by loosing Clysters, or by some gentle Purging Medicine.

Idem ibid.

Zecchius,
consult. 37.

XXII. D. Pilonus never cured a Dysentery by Astringents, because he observed that all who had it so stoppt, either relapsed, or fell into a Fever or Pleurisie. Nor did he use Sudorificks, because he thought they increased the heat of the part transmitting; and therefore he cured this Disease onely by Lenitives and Blood-letting.

Velfchius.

XXIII. In a Dysentery from salt phlegm falling from the head, we must act cautiously about astringent remedies: for when these Dysenteries are protracted beyond fourteen days and more, there are not wanting Physicians, who think astringent remedies may be safely administered beyond the fourteenth day. But they are in a great error, for a Dysentery from salt phlegm may remain as long as the intemperature of the head, which breeds the salt phlegm, and sends it to the Guts. For a year ago I cured two Patients, who fell into blear-eyedness, and intolerable pains of their joints, upon the unseasonable use of an astringent remedy administered in a Dysentery from salt phlegm. Therefore, in this case, revulsion of the humour should be made to the nostrils, and the head before or behind, by Cauteries, Sinapisms, or Cupping-glasses: The intemperature of the brain must be altered, and then Astringents may be used.

Saxopia.

XXIV. I

XXIV. I do not disallow of astringent Powders, whether of Roses, *Acacia*, or Pomegranate-flowers: But if any one fear their sharpness, he may take *Terra Lemnia*, *Samia*, or burnt Hartshorn; they dry without any sharpness, and bind moderately. I put more confidence in these powders than in Pills or Bolus's, which sometimes in a Bloody-flux I have seen voided with the Excrements whole and unaltered.

XXV. Chalybeate-water, Milk and Wine are not plainly to be rejected, since either some coagulating Spirit, or some astringent scalings of the Metal that stop the fluid humours, are communicated to the liquor: Yet I would, with *Platerus*, have this extinction moderate, and not too often made; since it is certain, if much of the substance of the Iron be taken, it loosens the Belly; nay, if it be taken plentifully, it causes Vomit also. And Steel must be given much more sparingly in a Dysentery, than in a chachexy, or obstruction of the Bowels; because there is need onely of some small astringent, and of no other effects of the Steel in this case. Nor is there any difference between fresh Steel, and that which has been often quenched. The parts indeed of Iron, that are communicated to the liquor, at its first heating, have a power to Purge: But because Steel is of an homogeneous nature; all its parts have the same virtue; and the more of its substance is communicated to the liquor, the more it Purges or Vomits. Nor also is there any necessity to cast away the first water, unless perhaps the Steel be not clean, but have got some rust on the out-side: for seeing this in the extinction may be communicated to the water, it may not be improper to throw it away. And I have thought good to advertise this, that these chalybeate liquours must be used when they are fresh prepared, especially if heated Steel have been often quenched in them: For the substance of the Steel in the beginning, and presently after extinction, retains the nature of the Scalings; but if it remain long in the liquor, it is turned, as it were, into rust, and then its faculty is rather to Purge, Vomit, and put the humours in motion, than to stop them. An instance whereof chalybeate Wines do give; that are given for obstructions of the Liver and Spleen, which if they be taken in any quantity, Vomit and Purge: For they are not given presently after the Steel is put in the Wine; but they are set in the Sun, or some hot place for some days, and shaken together, that the Steel may the better be dissolved. But if the question be about giving *Crocus Martis*, or prepared Steel in a Dysentery, I should rather use a *Crocus Martis*, made by the benefit of the fire onely, and reverberation: For it has not as yet got so vitriolate a Nature; but to acquire it, there is required another resolution, and therefore it excels in an astringent virtue beyond any other. All other preparations of Steel, whether they be infusions of prepared Steel in Wine, or in any other liquor, or solutions with *Aqua fortis*, Spirit of Vitriol, Sulphur, or distilled Vinegar, all of them favour more of a Vitriolick nature, and the *Crocus* this way prepared do participate something of the dissolving liquor, and have united the salt of the Vinegar, or the *Aqua fortis* to themselves. And therefore, although they have some astringent, and strengthen the tone of the lax Bowels in cachectick persons; yet because the faculties of opening, fusing and melting the humours, and if they be taken in any quantity, of Purging and Vomiting, prevail in them, they have no place in a Dysentery, but rather in obstructions of the bowels, and in cachexies. For seeing all the parts in these preparations, into which Vitriol may otherwise be dissolved, are not separated, but are like Vitriol separated from the gross earth, and a little calcined, and therefore the Spirit of Vitriol is as yet mixt with the Salt in them; it is no wonder, if they open, and sometimes Vomit

and Purge, since it is the property of Salt of Vitriol to doe so. And if we may give *Crocus Martis* thus prepared at all, the dose must be very small, lest it gripe the Guts by its Acrimony, or Vomit, or Purge, as it happened to an Empirick in *Forelius*, l. 4. obs. 4. in *Sebbio*.

XXVI. After evacuation presently alteration and contemperation of the bilious humours must be procured; which is of such efficacy in curing a dysentery, that it put *Anatus* into admiration, how a certain young Man, in a dysentery, could be cured onely by a draught of cold Water, which he drank without the advice of his Physician. But we may cease our admiration, if we observe, that *Celsus*, 4. 15. proposes cold Water as the best remedy for a Bloody-flux. But here decoctions of Herbs and Juices, Whey, Spaw-waters and Milk are proper. Take of the Decoction of Endive, Lettuce, Violets, Plantain, Purslane, 5 ounces, of clarified Juice of Plantain, Purslane, each 1 ounce. Mix them. Give it for five or six days; or, Take of Water of Lettuce, Water-Lily, Plantain, each 2 ounces, Seeds of White Popies 2 drachms. Make an Emulsion, to which add of Juice of Quinces 1 ounce, *Diamargariton* *Fortis*, *frigidum* 1 scruple. Mix them. For we must abstain from Sugar, as also from Honey.

XXVII. *Galen* against *Herodotus* declares sufficiently, what harm the unseasonable use of astringents does. It is suppressed indeed in the declension of the disease, and lest the matter being turned upon some noble part should injure it, astringents are ordered with Spices mixt therewith, and things that provoke Urine: for so the humour being diverted to the ways of Urine, the Ulcers may heal the sooner. And as far as I could ever learn by experience, I have observed some, upon stopping a dysentery unseasonably, fall into an Epilepsie; others into a Pleurisie. And one, having the matter turned to his hands, had them full of filthy thick scabs. Some were so bound with astringent Medicines, and their Guts so dried, that afterwards they scarce went to stool once in four days. ¶ In the year 1659, there was an Epidemick Dysentery up and down *Switzerland*; one *Bedor* his Wife was taken with it in the Village *Courcelles*, in the Province of *Newemburgh*, she had recourse immediately to astringents, by the use whereof it was stoppt; but, the humours falling back upon her right knee, it continued swollen to her dying day.

XXVIII. A very painfull dysentery had afflicted two well-grown Virgins for several days, at divers times; by reason of the Guts being exulcerated with yellow choler mixt with salt phlegm. At first they had large, frequent, liquid and various stools, mixt afterwards with a sort of Fat, which were followed by caruncles, or bits as it were of flesh, plainly to be seen in their Excrements. Yet both of them escaped by my assistance. Among other things, liquid Balsam of *Peru* was very successfull, mixt in Clysters, to defend the exulcerated Guts from the sharp and putrid excrements, and to heal them. I have also experienced the singular virtue of this most noble exotick liquor, as well in immoderate *Diarrheas*, as in Bloody-stools, when other things would doe little good. And truly the effect of it was admirable in a young Man, who was most barbarously tormented with most cruel Gripes, a sanious sinking Matter coming out with the Excrements, an argument of an Ulcer in the Guts: And these Gripes could no ways be mitigated, till I ordered the following Clyster to be given him, and moreover half a scruple of the same Balsam, mixt with Pine-Nuts, adding of Syrup of Orange-Pill 2 drachms, and refined Sugar half an ounce. This was the Clyster; Take of the root of Tormentil, Comfrey, each half an ounce, Leaves of Plantain, Shepherds-purse, Horse-tail, red Mint, each half an handful, Flowers of Red-Rose, Pomegranate, Rosemary, each 1 pugil, Seeds of Sumach 2 drachms.

Lucas Scroec-
kius, Ephem.
Germ. ann. 3.
p. 126.

Boil them in a sufficient quantity of Spring-water. In 7 ounces of the Colature dissolve of Sugar half an ounce, Balsam of Peru dissolved with the Yelk of an Egg 1 drachm, Juice of Plantain fresh drawn 1 ounce. When the Patient found present ease, two hours after I ordered it to be repeated.

XXIX. Since some commend the use of Milk, and others forbid it, it is certain that it has been given sometimes with good success, sometimes with bad: For *Amatus, cur. 44. cent. 2.* says, he once accounted it poison. *Hippocrates 5. aph. 64.* affirms, it is hurtfull to several persons. *Saxonia*, on the contrary, in *præl. pr.* affirms, that he has not only taken away pains, but has cured Dysenteries at the first without any other help. Nor are reasons wanting, for Milk especially allays the heat of Choler, takes off Acrimony, and allwages the heat of the bowels: As it purges downwards, it carries off cholerick filth. But this or that preparation, or this or that constitution of a disease renders it wholesome or unwholesome. Milk consists of three substances; of Cheese, whereby especially it nourishes, and plasters the Ulcerated Guts; Of Butter, whereby it eases pain, digests, anoints the Guts, and fences them against sharp humours: Of Whey, whereby it is absterfiv and cleansing. In many respects therefore it is proper; as it serves the turn both for food and physic: Yet the use of it must be circumscribed with several cautions. In the first days therefore, it must be used raw and new milked, that the choler may be drawn downwards, so *Ætius* advises: in the progress of the disease, that the flux may be stoppt, it stands in need of preparation; and the Whey, which has the deterfiv faculty, useles at that time, must be consumed by boiling Gold in it, or quenching Flints and Steel therein; so also the fat and igneous parts, prone to turn into choler, or to purge, are dissipated. But if the prohibiting Symptoms proposed by *Hippocrates 5. aph. 64.* attend a dysentery, as Head-ach, Thundring, Hypochondriack Meteors, a high Fever, a flood of Choler flowing in abundance, we must abstain from Milk, or a fourth part of Rain-water must be added, and given, after it has boiled a little, mixt with a little Honey, lest it corrupt on the stomach. Thus prepared, it may, according to the opinion of several, be given innocently, when these impediments are present. Note, the greatest part of the Cacochymie must be carried off by Purges, before the use of it. ¶ *Hor. Augenus* says, that is the safest way of giving it, and one that never fails, which *Ætius* proposes, which nevertheless he uses not for purging in the first days, because we have other very safe Purgers, much safer than the use of Milk: But he commends it in the progress of the disease, pouring into it, as it boiles, a fourth part of Water; and that for three days: For the next three days he boils the Milk a third part, or half away: When there is a Fever with it, he says all inconvenience may be corrected by mixing Rain-water with it. ¶ Milk may be given notwithstanding bilious stools, or a Fever, if so be most part of the choler be purged away; onely the inconvenience must be taken away by boiling it with Plantain-water, or by quenching red-hot stones, or Gad's of Steel in it; for it is imbued with a faculty, that dries and resists corruption; and if the Fever be not great, it hinders not the giving of Milk: for this is allowed by *Hippocrates 5. aph. 57.* to those that are not in a high Fever. He also, 7 *Epid.* gave it to *Critolaus* his Son, who had a Fever and cholerick Stools, and recovered.

Fortis, com-
sult. 93. cent.
2.

XXX. This must be remembred, that all Medicines that are made of *Opium*, Henbane, Mandrake, or black Poppy, are suspected for this reason, because, although, they seem to ease pain, and therefore to strengthen the bowels; yet the humours being gathered together, are afterwards voided without intermission; and the head being made

heavy, and the strength wasted, they put the bowels in a worse condition; Wherefore, according to *Trallianus*, they should be avoided, except pain or watching do of necessity require them, for then you may have recourse to *Philonium Persicum*, or *Romanum*, which yet may more innocently be mixt in Clysters. ¶ The want of Opiates rightly prepared has rendred Narcoticks hitherto suspected, but the successfull use of well-made *Laudanum*, in several diseases, has forbid the abrogating of the use of Narcoticks. *Riverius* in his Practice, says, That Narcoticks taken by the mouth sometimes doe wonders, they ease pain, stop a flux, cause sleep, and so likewise recruit strength: But they will be much more proper, if they be mixt with astringents and strengtheners. With what success he used them, several of his observations testify. ¶ *Horstius, l. 11. obs. 3.* shews the efficacy of *Laudanum*; It is known, not onely what gripes, but even exceeding bloody stools, kindly Dysenteries do sometimes cause, whereby many would pay Nature her debt, were they not succored by the use of Opiates: Which a Noble Woman the last year confirmed; who, in the judgment of all that were by, was reduced to the last extremity; but was so refreshed with 3 or 4 grains of our *Laudanum*, that in a short time she recovered.

Zecchiu,
consult. 27.

Aug. Thone-
rus, l. 3.
obs. 10.

XXXI. *Thomas Minadous*, a Physician and Professour of Italy, affirms, that he observed, all died of the Bloody-flux, who by the advice of Physicians, took *Laudanum Opiatum*: And that after the use of it the Ulcers grew more putrid and foul, from the long stay of the purulent matter and noxious humours. Let this therefore suffice for a Caution.

XXXII. As in the cure of a Dysentery, for Revulsion sake we use frictions and ligatures of the upper parts; as likewise we endeavour to cause Sweat, and sometimes provoke Vomit; So also, according to *Galen's* Doctrine, we ought to provoke the noxious humours by the neighbouring places that serve to carry Urine: But we must have a care one danger do not incur another; for thence there is a two-fold one impending; the first is observed by *Celsus, l. 4. c. 15.* If things that provoke Urine, obtain their end in turning the Humour another way, they doe good. If they obtain it not, they augment the Ail. Therefore he subjoyns; They must not be given, except to such persons, as in whom they use to have their effect speedily. The other danger is, lest the Urerter places and Vessels, which are much straiter than the Guts, when the sharp juices are called thither, should be fretted and Ulcerated, and so a dysury should succeed a dysentery. The Skillfull avoid dangers by giving Diureticks long after the beginning of the Disease for derivation sake, when part of the Abundance of humours is spent, prescribing not Diureticks, but lenients with cold and moisture. *Hildanus* commends Earth-worms for this purpose.

XXXIII. I reckon I should not conceal one remedy, very familiar and successfull with me, and known and used also by several Physicians. It is this, Drinking of natural Waters, that are potentially cold: for from them we have two things: The one is the cooling of the Liver: The other (forasmuch as these Waters are in some measure astringent) is, that by stopping the Flux, they give tone to the bowels, and contribute to the cure of the Ulcer. Yet the use of them must not be indifferent: for it is not safe to give them, when the peccant matter abounds in the body: for if such matter should be intercepted by virtue of this Medicine, one of these two things would follow; either because this same matter being retained, would be turned to other noble parts, and then if it were turned to the more noble parts, it would cause mortal sickness: If to the less noble parts, it would cause less mortal sickness; yet very grievous ones: Or the matter being detained is made sharper, and gathered in greater quantity, whence sometime falling with greater violence afterwards, it is the cause of a worse Dysentery. Wherefore the time to use such Waters, is, when the matter being

being evacuated in part is less in quantity, for from them we may have with safety the cooling of the Liver, strengthening of the Bowels, interception of the Flux, and a cure for the Ulcer. But if at the beginning of the Dysentery there neither be a quantity of excrements, nor any notable pravity in them appear, they may then safely be given; for I have used them frequently, and have found the drinking of these Bath-waters so successful, that I should never desire a more effectual Remedy for the cure of a Dysentery, than them seasonably given: And I can affirm I was never frustrated of my expectations in giving them. Now I have respect most to the Stomach, which I have ever a care to strengthen and defend against the Cold; if it be very weak, I use them not at all.

P. S. Diver-
sus, Not in
Altimar.
c. 76.

XXXIV. The use of Wax in a roasted Apple is highly commended, and it is no unusual Medicine at this day. I think it was known to *Valeriola*, lib. 3. obs. 4. And although *Serapio* write, that Wax is one of those Medicines that are not to be taken inwardly; yet if it be taken moderately, it has an emplastic virtue, whereby it may heal the Ulcer, and a Lentor, whereby it may assuage it. *Dioscorides* himself, 2. 76. says it may be given in Broth to dysenterick persons. And although *Valeriola* thinks that the virtue of the Wax cannot reach the ulcerated Guts, because through its thickness and emplastic faculty it must stick in the first ways, fastning it self like Glue; yet a roasted Apple hinders it from doing so, with whose substance it is mixt in the minutest particles, and which may serve as a Vehicle to it. *Valeriola* chuses a Quince-apple, that one and the same Medicine may have both an astringent and glutinous faculty, but may be an Apple is more convenient, because it is a most apt Vehicle to carry the Wax through the windings of the Guts.

Sennertus.

XXXV. A Nutmeg is commended as highly beneficial in this Disease, because of its different qualities: By its earthy substance it binds, strengthens the Bowels, dries and causes a Cicatrice: By its oily Substance it eases Pain, smeares over the Guts, lest they be hurt by the Sharpness of the humours: By its aromatick quality it strengthens the Liver, Stomach, and the mouth of the Stomach; and dispells Wind. When because of some febrile heat any mischief is feared from its heat, it may be gently roasted in hot ashes, when you have wrapped it in Hempen-hurds, or otherwise: But it must not be roasted, as is usually done, upon a Plate of Iron red hot; not only because the oily part perishes in this manner; but by adustion it may easily acquire acrimony.

Idem.

XXXVI. *Mindererus Med. milit.* p. 246. has an elegant passage concerning Oils. He says, that Oils must be curiously excluded for several reasons: 1. Because they hinder Consolidation, you have an Instance in cutting a Vein; for if you would open the Vein again in the afternoon, you must dip the Lancet in Oil, and the Wound it makes will not close presently. The same also is done in Cupping-glasses, and it is true indeed, that Ulcers are made foul thereby, which rather stand in need of drying; and, according to *Galen*, Oils are an enemy to Ulcers, as Wine is very much a friend. 2. Because all Oils, except of Linseed, Popy-seed, Hemp-seed and Sweet-almonds, have something of Sharpness in them, but these have little of it: Which is demonstrable thus; If a drop of Oil-olive be dropt into the Eye, it will smart as if Juice of Citron or Limon had been dropt in.

Wedelius,
de m. comp.
ext. p. 87.

XXXVII. Some reckon outward Medicines useless, because their virtue cannot pass the Skin, the Muscles of the Belly and other hindrances; yea, hurtfull, because of the expression they make of the humours in the outside of the Body to the Intestines. They vouch *Galen* for their Authority, who, 1. ad Glauco. c. 14. affirms, that the closer the Skin is, the more the Flux is increased. But these People

may be opposed by experience, which often shews that a Flux is stoppt by the use of them. But as to the use of them in fat People, we must take notice that little benefit can be expected from them, because they cannot penetrate; therefore some Vehicle must be given them, as Vinegar or White wine, lest by the grossness of their parts, or their too great cold actual or potential, they stop up their own way. We must observe also out of *Ælius*, that they cannot innocently be used in a Dysentery caused by Sharpness of Bile, and in cancrus and malignant Ulcers, because they consume the watery part and leave only the biting.

Sennertus

XXXVIII. Although the word Dysentery denote the Bloody-flux; yet, without any prejudice to its Etymology, I will apply this name to this London Disease. Every year, usually about Autumn, Gripping of the Guts with a Looseness is rife. The stools are watery and as it were limpid, with a sudden decay of strength. No evacuation promoted the cure of this Disease; yea, Blood-letting, Vomiting and Purging always did hurt; and usually the proper Remedies were only Cordials, and those very hot ones, that is, such as abounded in Spirit and Sulphur, or in volatile Salt: Inasmuch that Brandy a little burnt with Sugar was the common, and as it were the epidemick Medicine, and proved always in a manner successful; although used indifferently in the other that was bloody, it was often found hurtfull.

Willis;
Pharon. ratio
scilicet, 3. c. 3.

XXXIX. Gripes in the Guts without stools begun to invade People in the beginning of August, 1669. and were as many at the end of Autumn as the Dysenteries, which entred with them. Now this Disease seizes a Man with a shaking and shivering, which is followed by a heat all over the Body (as is usual in Fevers) and quickly after by a Gripping in the Guts, and then by stools, but oftentimes there is no sense of a Fever going before. All the stools are mucous and not stercorous, except that sometimes a stercorous one is interposed, and that without any notable pain. Some streaks of blood are mixt with these mucous stools. In the mean time the Patient, if he either be in the flower of his age, or be heated with Cordials, is in a Fever, his Tongue being whitish and thick beset with slimy stuff; and if he be violently heated, then it is black and dry. His strength is cast down, his spirits spent, and there is all the tokens of an ill conditioned Fever. This Disease causes not only extreme pain and sickness, but, unless it be skilfully handled, much endangers the Patient's Life. For when the stores of vital heat and spirits are exhausted by frequent stools, before the peccant matter can be thrown out of the blood, and when Cold in the extreme parts comes upon one, the Patient will be in danger of death. Since it may so be, that various Species of Dysenteries may arise, as there are of Measles and other epidemick Diseases, proper to different Constitutions: therefore they require in some things of right a different method of Cure to themselves. That we may proceed to curative Indications. When I had diligently weighed the various Symptoms that happen to this Disease, I found it a Fever (that is, of its own kind) turn'd inwards upon the Guts, by means whereof the hot and sharp humours contained in the mass of blood, and putting it in agitation, are discharged by the mesenterick Arteries upon the said parts, and, the orifices of the Vessels being laid open by the force of the humours making thitherwards, the blood is poured out by stool. In the mean time, by the importunate straining of the Guts, which doe their utmost endeavour to expell the sharp humours, that continually trouble them, this mucus, wherewith they are naturally smeared over, is discharged together at every stool, sometimes more sparingly, sometimes in greater plenty. Therefore the indications seemed to offer themselves of their own accord, that first

I should

I should immediately make revulsion of these humours by breathing a Vein, which done, that I might moreover qualifie the rest of the mass; also that I should carry off the said humours by Catharticks. The first day, as soon as I was called, I advised the breathing a Vein in the Arm; the same night I gave a Paregorick; and the next morning this gentle cathartick Potion, very familiar with me; Take of Tamarinds half an ounce, Leaves of *Senna* 2 drachms, Rheubarb 1 drachm and an half; Boil it in a sufficient quantity of Water; In 3 ounces of it strained dissolve of Manna and Syrup of Roses solutive each 1 ounce: Mix them; make a Potion. I usually prefer this Preparation with a small quantity of Rheubarb before any Electuary; for although Rheubarb be designed to evacuate Cholera and all sharp humours; yet unless some Manna or Syrup of Roses, or something of the same nature be mixt, that it may amount to a fuller Purge, it is not very proper.

But since it is obvious enough that the most gentle Catharticks and such as will but give a stool, do encrease the Gripes and cause a dejection of spirits and an universal disorder in the Patient, namely, by the adventitious tumult, whereby it stirs the blood and humours in the operation. Therefore it is customary with me to subjoin a Paregorick a little sooner than we use to doe after Purges, that is, at any hour in the afternoon, if we think the Purge has done its work, that, namely, I may stop the motion which I set on going. Afterwards I prescribe the said Cathartick for two times more, that is, to be taken every other day. I give a Paregorick also after each Purge, at the time I advised before. Moreover, I take care that it be given morning and evening those days he does not purge, to the end I may subdue the fierceness of the Symptoms, and gain time, while I am busied in carrying off the peccant humour. After bleeding and once purging I allowed them a taste of some temperate Cordial-water now and then. And I used for an Anodyne *Laudanum liquidum* (See its Description, Book 3. Tit. de Colica Biliosa) that is, 14 or 15 drops in any Cordial-water, for one Dose. This recommended method has easily the preeminence over all, that are yet known to me, in conquering this Disease, which very seldom continues beyond the third Purge.

But if the Disease were so stubborn, as not to give way to these things, then I used to give my Patient a Paregorick every day in the morning and at the hour of Sleep, till he was perfectly well; nor did I find the least inconvenience from so frequent a repetition of a narcotick Medicine as far as I could ever yet observe (how great harm soever some unexperienced persons may threaten will follow from thence) although I have known several, who in a stubborn Disease have taken it every day for some weeks together.

Dysenteries in general were to be treated after this manner. But it was observable, that what came the first year, were of a more subtle and spirituous nature, than what infested men the following years; and therefore they did not so readily yield to purging Medicines, as to them that diluted and tempered the blood and those sharp humours which are separated from it into the Guts. Wherefore the first Autumn that the dry Gripes and Dysentery invaded us, I constantly used the method following to drive away either Disease, the issue every way answering, till, upon the approach of Cold, I found it less efficacious the same year, and so the years following, when the Disease had departed farther from its subtilty, I found it wholly useless.

And I proceeded thus; If a Patient in the flower of his age had a Fever, I ordered him to bleed in the Arm, and within an hour or two to be well washed by throwing in a great quantity of Liqueur

(See Book 3. Tit. de Cholera) as was done in a Vomiting and Loosness, but not as there, with Chicken-broth or Posset-drink; but Whey to be drunk cold in the like quantity; and I ordered a Clyster of it warm, without Sugar or any thing else. I ever observed, that the Gripes and bloody stools after the return of the fourth Clyster did vanish. When this trouble was over, and all the Whey was passed, which will be in three or four hours space, if the Patient doe his duty diligently; I forthwith committed him to his Bed, where, in a short time, of his own accord, he was dissolved into a Sweat (from the Whey mixt with his Blood) which I ordered to be continued twenty four hours: allowing him nothing in the mean time, but raw Milk, a little warmed, which also he was to use, and nothing else, for three or four days after he rose from his Bed. If either he left his Bed or the use of his Milk too soon, he was to go through the same course over again.

XL. Because the Advice of a Physician, that would cure, must not onely be directed to the present state of the Patient, but also to the future, we must know, that although a thin Diet and Fasting be good for dysenterick persons, in the first days; yet, because in process of time the strength may be wasted with pain, watching, and often going to stool, it is good afterwards to feed the Patient somewhat higher. To this purpose things distilled off Flesh roasted, with Simples, or Gelly-broths, may seasonably be given.

XLI. Let the Meat be simple, and easie of Digestion; wherein the Vulgar often offend, who give to dysenterick Persons the hardest Meat and difficult of concoction, if they think there is any binding quality in it; and so they increase Crudities and the Disease.

XLII. As to Drink, the best way is to drink sparingly. *Paulus* and *Aetius* give rain water, wherein astringent fruits have been boiled, especially *Sumach*, *Sorrel* and *Plantain*, but it is onely proper for them that are used to it. In our Countries pure Beer is proper. *Amatus Lusitanus*, cent. 2. obs. 46. tells of a cholerick young Man, who in the heat of Summer began to be afflicted with a Dysentery and cholerick stools, and when he was destitute of any Physician's advice, he drank store of cold water, and was thereby recovered. Which nevertheless we may not imitate, unless in hot Countries, a hot Season, and where Choler abounds. When Strength fails, let some astringent red Wine be given, diluted, if convenient, with spring water, wherein heated Steel or Gold has been quenched, or wherein Plantain has been boiled or infused. And because the concoctive faculty does here fail, the use of Wine is often beneficial and necessary; and, I have observed, it agreed well with several in this epidemick Dysentery.

Medicines especially made use of by eminent Physicians.

1. Give the Dock, finely powdered, to the quantity of a spoonfull, with a rear Egg; and you will admire. ¶ Sup liquid Alume, with an Egg, and then drink some dissolved in warm water; and you will wonder.

2. The diaphoretick Flowers of Antimony are highly commended. ¶ *Saccharum*, or *dulcedo Aluminis*, is a most certain Remedy in the Bloody-flux. The Dose is 6 or 7 grains in Marmelade of Quinces.

3. The Leaves of Silver-weed applied to the Soles of the Feet are reckoned a Secret to cure any Bloody-flux in twenty four hours. ¶ One was cured to a miracle, and that quickly, onely by using for his ordinary Drink, water wherein Cork was boiled.

4. I ever found this Plaster most effectual in a Bloody-flux, applied to the Belly and Reins; Take of Tormentil root, Crum of a white Loaf, each what is sufficient; Boil it in Wine or Vinegar till it be Pap. Spread this on a Cotton cloth, and apply it to the region of the Belly before and behind.

Balth. Brun-
nerus.

5. I have always found this doe good as an Anodyne, that is, by anointing with Oil of St. John's-wort, and applying Nettles bruised between stones and heated, to the Belly.

6. In the end of a Dysentery, Juice of Worm-wood and Mint well purified, and made into a Syrup, is very good. ¶ *Emplastrum Diaphenicon frigidum* applied hot to the whole Belly, is most excellent in any Dysentery; the same also may be applied in the beginning.

7. Take pure root of Tormentil grossly bruised 6 ounces; Pour to it in a glass Body of Tormentil water 16 ounces; Let it simmer on a gentle Fire, then let it cool, and pour off and separate the Decoction carefully from the Root; add of fine Sugar half a pound. Set it in Sand, and with a gentle Fire reduce it to the consistency of a Syrup. Then add of the Tincture, Oil, or Liqueur (first precipitated with distilled Vinegar, and then with Spirit of Vitriol) of Corals: mix it well, and keep it. It is a most excellent Remedy in the Bloody-flux.

Mich. Crug-
nerus.

8. Oil of Walnuts cures a Flux miraculously, if it be taken inwardly, and the Belly be anointed therewith. ¶ This is reckoned a Secret in stopping Fluxes of the Belly; If you take of the Juice of unripe Grapes 10 spoonfuls, boil it a little; after it is clarified, drink a third part of it; for it presently stops the Flux and strengthens the Bowels.

Claud. Deo-
datus.

9. They say Cudweed boiled in Wine is an effectual Remedy.

Dioscorides.

10. Boil a Crab with Wine and Pepper; take off the Shells and dry them: the Powder of the simple Shell taken twice every day cures any Flux specifically. It may also be mixt with other things. It is an experienced thing. ¶ Distilled water of Celandine drunk, powerfully stops any Flux, as I have heard one say upon his certain experience.

Tob. Dorn-
cellius.

11. There is no more present Remedy than *Uva quercina* in Powder, for any Bloody-flux. I have cured some of desperate Dysenteries onely with it.

Christoph.
Engelius.

12. The Cawl of a Wether fried in Oil of Roses, and applied, is an excellent Remedy to stop the flux of it.

Franc. Osw.
Grembs.

13. A linen cloth dipt in the blood of a Hare not killed by a weapon, but in hunting by the bite of a Dog, and dried and kept for use; if it be made Lint of, and given in Wine, it cures the Dysentery. Yea, the Soldiers in Germany, when they have killed a Hare in the aforesaid manner, dry her in the smoke, and give her in drink; and so cure the Bloody-flux infallibly.

Van Hel-
mont.

14. The Liver of a Wolf prepared (that is, when it has been steeped 3 days in very strong Vinegar, and then dried in an Oven upon a Tile) is highly commended.

15. The Pisse of a Cat is a most certain Remedy in this Disease; the Shavings of it may be mixt in some Electuary.

Frid. Hof-
mannus.

16. It is admirable, that *Colcothar* (the *Caput mortuum* of Vitriol) should possess a quality to cure a Bloody-flux, that is, if they that are afflicted with the Bloody-flux do go to stool upon it, it cures them. This is confirmed by many observations of D. Michael.

Christ. Lan-
gius.

17. Half a drachm of Crystal finely powdered, and prepared, taken in some convenient Water, is a singular Remedy for a Dysentery, especially for one arising from porraceous and yellow choler.

Job. Langi-
us.

18. I have observed it by experience and beyond all doubt, that 2 drachms of *Filipendula* root given either in Wine or the Yolk of an Egg is good. The leaves and roots of which Herb I have often found to doe both the same thing. ¶ I have found this Poti-
on doe a great deal of good; Take of Syrup of Popy

1 ounce, of dried Roses half an ounce, *Diamargariton frigidum* half a drachm, burnt Ivory half a scruple, Water of Plantain, Horfe-tail, each 2 ounces.

¶ This is excellent good to ease pain; Take of *Acacia Hypocistis*, the inside of a Quince, Sumach, Galls, each 1 drachm; red Coral burnt and washt with Rose-water 1 drachm and an half, *Opium* 1 drachm, Cinnamon, *Cyperus*, each 1 drachm; Syrup of Roses what is sufficient. Make a solid Electuary; of which make Pills; whereof you may give a scruple or half a drachm.

Lud. Mercat-
tus.

19. An Egg boiled in Vinegar, and eaten, stops all Fluxes of the Belly.

Oribasius.

20. The Feet of a Partridge roasted, and one drachm of the Powder given in Coriander water, when there is a Fever; and when there is none, in black Wine; cures even a raging Dysentery.

Joh. Prævo-
tius.

21. The dung of a Dog that eats bones, dried and powdered, and put in a little chalybeate Milk, is good for a Dysentery, given for 3 days morning and evening. I can safely swear I have cured above an hundred of the Dysentery with it in one year, as *Christopher Landrinus* can testify.

Joh. David
Rolandus.

22. The Fruit of the Linden-tree yields an effectual Remedy for any Flux of the Belly, as *Camerarius* testifies.

Valesc. de
Taraora.

23. The lesser Plantain given with an equal quantity of *Daucus* is a singular Remedy.

Gul. Varig-
nana.

24. This is very much commended; If the Patient for 3 or 4 days morning and evening sit over a red hot Plate of metal, upon which 1 ounce of the best Turpentine or Pine Resin must be thrown.

¶ This is an admirable one, especially in Childrens fluxes, if every day morning and evening the Child's anus be fumed with the Powder of young Asses dung, carefully dried in an oven, and strewed upon red hot Coals. ¶ The following Fomentation also is highly commended; Take of Balm 1 pound, Mullen 1 handfull; put them in a long bag, which afterwards boiled in a like quantity of styptick red Wine and strong Vinegar, to a third, must be applied warm to the Seat.

Benedict.
Victor.

25. Many reckon Cresses seed given alone or mixt with other things a singular Remedy in the Bloody-flux.

Arn. Wei-
kardus.

26. This is a singular Remedy for any Flux of Blood; Take Frog-spawn, and dip a linen cloth at least thrice in it, dry it in the shade, and doe so thrice. Which cloth so prepared and dried you may use. Apply a piece twice as large as the place where-out the Blood flows. Keep this as a Secret. ¶ This is a singular Remedy for the Bloody-flux; Break a new Egg into a new earthen Pot, then take a like quantity of Honey, Vinegar and Oil; mix them all together and bake them. Eat them, and you will find a good effect.

Marc. Ant.
Zimara.

Dysuria, or, Sharpness of Urine.

The Contents.

It must be cured variously, according to the diversity of the cause. I.

A Point is proper. II.

The benefit of Clysters. III.

Cassia sometimes suspected. IV.

Diureticks sometimes hurtfull. V.

It arises sometimes from the defect of the humour that moistens the urinary passage. VI.

Sometimes from the site of the Bladder altered. VII.

Sometime from the glandulous Body too much dried. VIII.

Medicines.

I. A Man threescore years of age was sick of a violent Sharpness of Urine; some placed the cause in his Bladder, others in his Kidneys: But when he was dead of an Apoplexy, there was

was no fault observed in his Reins or Bladder, one-ly the Liver was somewhat hard. So that it plainly appeared, the fault came from the too great Sharpness of the Humours that run to the Bladder; for his Urine was tinged and clear enough. One at last died of this Disease; there was a Stone found in his Bladder that weighed 2 ounces and an half, with a great Putrefaction of his Kidneys, he was exceeding venereal.

J. Hestus
and Schen-
kium.

¶ In curing old men, who are sick of Sharpness of Urine or Strangury, we must see that the fuliginous and serous excrements perspire. We must see also whether any Catarrh fall from the Brain by the Spine upon the Bladder; for it must be diverted. I saw one who when he had been sick of a Dysuria, after he had voided a whitish humour by Urine, was rid of his Dysuria. He was in his declining age; how much more then may a Dysuria be caused in old Men by this humour?

Hollerius,
apb. 31. 3.

Baehnius.

¶ One is sick of a Dysuria, a purulent matter runs the whole day from him; undoubtedly it must come from his Parastate. ¶ Sometimes a white and milky matter is voided in such plenty, that when it is settled, it takes up half the room in the Chamber-pot. The Cause is both the weakness of the Stomach, that makes ill Chyle; and a weakness in the Kidneys, to which when some lacteal Veins come, that receive immediately the watry Chyle, then when the Kidneys are weak, the thin Chyle not well cleared of the salt tartarous dregs, being carried thither, it passes, together with the Urine, into the Bladder; it is a Disease familiar to Women and cold complexions. *Pulv. Stomach. Quercetani* is good, with the inner Coat of a Hen's Gizzard in Hippocras-wine; and outwardly to anoint with *Unguentum Stomach.*

H. Sinannus.

II. Both Learned men have written, and Experience it self hath often taught me, that a Vomit is a most excellent Remedy in the heat of Urine. For a Vomit draws powerfully, and evacuates the cholerick humours from the Liver and mesaraick Veins: And we must begin with gentle ones.

Fabr. Hildanus.

III. Clysters of pure Milk, or mixt with Mucilages, use to be so efficacious, that I have known some Patients, who after long Pains have found ease onely by this Remedy and a Bath.

Riverius.

IV. It is necessary that the Body be evacuated at certain intervals. This may be done by lenient and gently purging Medicines: for by strong ones the humours are inflamed, and the heat of Urine increased. *Cassa* in this case is preferred by most Authors: but I have observed, that after the use of *Cassa*, the pains have been increased in several Patients.

Hildanus.

V. Young Physicians must be admonished, that in Sharpness of Urine they make not a negligent inspection into the Causes of this Disease. For there are many deceived, who think it arises from the Stone in the Bladder, wherefore they give their miserable Patients Medicines accommodated to break the Stone, which is turned to their Urine: for the heat of Urine is increased by those Medicines that are endued with a hot faculty: whereupon an Ulcer in the Kidneys or the Bladder must needs be bred, and therefore they must be continually upon the rack, who fall into the wicked hands of such Hang-men. As in my time it happened to one, who, neglecting necessary means at first, and afterwards taking all the Medicines of Empiricks, fell into a mortal Diabetes.

P. Schallius.

VI. A certain oleaginous matter, that drops down insensibly moistens the *Urethra* in a Man, and the passage of the Womb in a Woman. In defect of this, the Urine being sharp hurts the *Urethra*, and cannot pass freely out. Several have been cured by moistning Diet, a Bath, and Oil of Sweet-almonds injected by a Syringe into the *Urethra*.

Riolanus.

VII. The site of the Bladder is sometimes changed, when that portion of the *Peritoneum* wherein it is enclosed, is loosened, and a little turned down, which causes a difficulty in pissing, except the Belly be lift up by the Hand.

Idem.

VIII. One made water with difficulty, those Glands being dried up, which are called *Parastate variciformes*, nor did he discharge his Bladder without a great weight of Urine: So I ordered those Parts, and the whole Body to be restored by Unctions, and the passage of the Urine being open, he was cured.

Al. Benedictus.

Medicines especially made use of by eminent Physicians.

1. Nothing is better in Heat of Urine than Steam of Milk, wherein Mullein has been boiled. ¶ An admirable Syrup for Heat of Urine; Take of Seed of Marsh-mallow, Mallow, Quince, Fleawort, each 1 ounce; put them in a hot Decoction of the Root of Marsh-mallow, Seeds of white Popy, winter Cherries, what is sufficient. When the Mucilage is made, strain it, and with Sugar make it into a Sy-Deodatus rup.

2. The following Elestuary wonderfully corrects the hot Intemperature of the Brain, and Sharpness of Urine; Take of Conserve of Flowers of Water-lily, Violets, Roses, Flowers of Cichory, each one drachm; white and red Saunders, each 1 scruple; Seeds of Sorrel and Purslain, each 2 scruples; Trochises of Camphire, 1 drachm and a half. Mix them with Syrup of Popy. Make an Elestuary. The Dose is 2 drachms morning and evening.

3. *Johannes Baptista Theodosius* commends the following Medicine out of *Galen* and *Avicen*, as one that never failed him; Take of Mallow-leaves 1 handfull and an half, fresh Butter 2 drachms, Honey half a pound: Let them boil in 5 pounds of Water to a third: Of which you may drink a little.

Joh. Fontanus.

4. One applied this Cataplasim to his twist, and he presently made water freely; Take of Pellitory of the Wall 2 handfulls, Chervil 1 handfull and an half, cut them and boil them soft, add of Butter 2 drachms, Oil of Scorpions 1 drachm and an half. Mix them and apply them hot. It did so much good, *Forestus*, there was no need of any other Remedies.

5. I will not conceal this Powder wherein I put great confidence; Take of Winter Cherries, No. xij. Seeds of Cucumber, white Popy, each half an ounce; white Sugar what is sufficient. Make a Powder: of which take half an ounce always before meal.

6. Take of Salt Nitre prepared, Sugar-candy, each half a drachm; give it in Parsley-water; it is experienced.

Job. Prætorius.

7. An Emulsion of Chestnuts and a little white Popy seeds made with Liquorish water, is good for Heat of urine.

Wittichius.

A GUIDE TO The Practical Physician.

BOOK V.

Of Diseases beginning with the Letter E.

Ebrietas, or Drunkenness.

The Contents.

*Whether it be discussed by drinking Wine afresh? I.
Discussed by applying a Medicine to the Stones. II.
When a Bath is proper for the cure of a Surfeit? III.
Medicines.*

I. According to the rule of *Schola Salernitana*,

A

*Si nocturna tibi nocet potatio vini,
Hoc mane rebibas, & erit tibi medici-
na. i. e.*

If you be bitten by a dog over night, a hair of his tail will cure you the next morning. And although this remedy may seem to contradict the common fundamental of Medical Cure, that Contraries must be the cure of Contraries; and that of *Hippocrates* 1 Aphor. 3. That fulness is cured by emptiness: Yet we must distinguish between things that are done by accident, and things that come of themselves. Repletion is not truly the remedy of repletion; but it does good, inasmuch as it excites the faculty and the innate heat; hence a consumption of the morbid matter happens from it: For Nature, upon the accession of new Aliment attempts concoction, which before it was not able to perform. Crude matter indeed over-heaped does harm, if the quantity exceed the strength of the stomach, but a little puts Nature in mind of her duty, and solicites her to perfect concoction. *Hollerius de morb. int. lib. 1. cap. 3.* affirms, that the hurt of Wine is removed by repeated drinking, inasmuch as Wine by its heating and drying power consumes the hurt of Wine; In the same manner as *Hippocrates* says, that pains in the

eyes, arising from thick vapours, are cured by drinking mere Wine. *A. Villanovanus*, in his Comment upon the aforesaid Verses, adds a caution, namely, that the rule holds not good when Drunkenness has heated the body: because then the repeated drinking of Wine, would be onely adding fuel to the fire.

II. One that had drank plentifully of Spanish Wine, fell from his seat and lay for dead; when his Scrotum, and all his Privities were wrapped up in the Juice of Hottleek, mixt with sharp Vinegar and Nitre, his drunkenness was presently discussed; yet a heaviness remained in his head.

III. *Galen*, for the concoction of crudity, orders them that are drunk to bathe the next day, and after bathing to go to sleep. Yet he advises not this in every head-ach, but when the head is hot without a Fever, then he prescribes a Bath, and after bathing to eat Lettuce, and sup Ptisan: But when flatulent vapours exhale to the head from putrid humours in the stomach, and cause giddiness, then he utterly disswades the use of the Bath.

Medicines especially made use of by eminent Physicians.

1. Leaves of large-headed Lettuce steeped in cold water, and applied to the head; are good for the Head-ach. *Jacob. Fen-
tanus.*

2. It is a most excellent thing to prevent drunkenness, to take 2 ounces of Oil. *Nic. Piso.*

3. One writes, that if you take the powder of burnt Swallows, it will never suffer you to be drunk. ¶ Also a Powder that hinders drunkenness is thus prepared; Take of Seeds of Colewort 1 drachm, Coriander half a drachm, Camphire 2 grains. The dose is a spoonfull in austere Wine. ¶ Also Vinegar taken either dashed with water, or by it self in a good quantity, is an Antidote

Felix Plate-
rus.

tidote against drunkenness; wherewith a notorious drunkard has used for a long time to arm himself against all harm from hard drinking.

4. If you take 2 ounces of common Oil of Roses, you will be free from drunkenness that whole day. ¶ This Powder is accounted a great secret; Take of the powder of Red-Roses half a scruple, burnt-Swallows 2 scruples, Seeds of Cabbage, Purslain, each half a scruple, Mastick 4 grains, Sugar of Roses 2 scruples, for one time.

Ecchymoma, or a Bruise, or Blackness and Blewness.

The Contents.

Fat things must not be applied. I.

We must use Suppuraters cautiously. II.

We must not tarry for perfect Suppuration. III.

A spontaneous one how cured? IV.

If the Skin be broken, it must be guarded, before a Cataplasin be applied. V.

A great one in the head cured by the use of dispersers. VI.

How cured in the sides, belly and back? VII.

How to be handled about the ribs? VIII.

The cure of one in the left Groin. IX.

Its cure by cutting. X.

One by a Fall how cured? XI.

They that are not timely taken out, end in sinuous Ulcers, and must be cured by cutting. XII.

Medicines.

I. **B** Ath-keepers apply to the contusion of the parts a midding Medicine, between a Plaster and a Cataplasin, made of astringents, dispersers, driers, and strengtheners of the tendons and nerves, as Bean-flower, dust of the Mill, Bole-Arménick, Comfrey, mixt with the White of an Egg. *Horstius* says, It is no absurdity, if we apply such things as soon as the part is bruised, though it want articulation, while the matter is yet upon motion thither: For then the affluent matter is wasted more powerfully by drying, and hindered by repelling. But if we use Unguents or Oils, the Skin and Pores are stoppt, so that what ought to exhale, cannot. Otherwise, if the Contusion be small, nothing is better in the beginning for moderate repelling and discussing, than a linen-cloth dipt in Rose-water and Whites of Eggs beaten, applied warm: Or if the Skin onely be bruised, it may be anointed immediately with Hog's-grease; It will be quickly cured without any spot.

II. If we can by no means obtain discussion, and there be marks of Suppuration, it must be promoted: Yet we must use caution in the application of Suppuraters, and we must not use any but such as are moderate: for if we mistake but a little in this case, a sordid Ulcer and Putrefaction may easily be raised in the part.

III. And because Modern Chirurgeons have observed this, they advise, when we observe a Contusion run into an Impothume, that we should not wait for perfect Suppuration: For if Pus, which is bred of concrete blood, be kept long in the part affected, it may cause much mischief, as Fevers, Pains and high Putrefaction, and corrupt the adjoining parts, Nerves and Bones; whence afterwards malignant Ulcers, and oftentimes *Fistulae*, derive their original. Nor also do they admit of emollient and suppurating Plasters and Cataplasins, because Putrefaction may easily be caused by them.

IV. A Man of Threescore, of a full constitution, complained of distensions from his head; the night following he observes a sudden remission of his Head-ach. His left arm was all on a sudden of a

deep blood red colour, without any pain or inflammation, and so was the upper part of the same side. When I was called, I judged it to be an *Ecchymosis*, from an internal cause, Nature driving the abundance of blood, which threatned an Apoplexy from fulness, to the out parts: and I declared that this afflux must be dissipated by things that digest gradually, and not at all by repellents: By which means the red colour became a little blew, and then yellow; just as we see *Ecchymoses* left after blood-letting are also dissipated by Nature. For this reason I ordered Ry-flower, mixt with powder of Chamæmil flowers, Savine and Melilot, &c. to be applied twice a day: Making use in the mean time of such things as plenitude requires. ¶ A boy six months old had several fits, at length when his Fits were returning, he was on a sudden taken with such another *Ecchymosis* about his left Eyelid and Cheek, whereby he was relieved, and seemed better in other respects. Here I told them they must abstain from liquid things, as being endued with a repelling faculty, by reason of their actual coldness, which they quickly fall into; and that they should undertake the business with dry digesting fomentations, by which also gradually a dissipation was obtained, as in the former.

V. This Caution is necessary before application of a Cataplasin, that, if the Skin be not whole, a thin linen rag, spread with *Unguentum rosatum*, *populeum*, or *de tutia*, be first applied, and then the Cataplasin.

VI. A Woman about 50 years old got a contused wound in her head by a fall, so that there arose a Tumour from the extravasated blood, as big as a Hen's Egg. When all was done that should be done, I thought of opening it, or suppurating it according to *Aphor. 5. 20*. To this there did concur, the abundance of matter, her age, the hardness of her Skin, the Winter-season. Because she was against opening it, and that I might avoid the pain and other troubles of Suppuration, I tried dissipation. First I fomented the part with warm water for half an hour, then I shaved the part against the hair, that the pores might be better opened, and the filth sticking to the part might be better got off: Then I applied of Oil of Lilies and Chamæmil equal parts, applying upon that warm Cotton fumed with Spices, and so the Tumour dissolved beyond all expectation.

VII. They think this must especially be observed, if the contusion be in the sides, belly or back. For then we must take especial notice, whether in 3, 4, or 5 days, there arise upon the place, where the Contusion was, a Swelling with pain, whether it increase daily, and there be a throbbing pain, and the Patient cannot indure the part to be touched, if an unusual redness appear round it, if he breathe short, and there be any heat in the body: For when these things appear, although no blewness appear in the outer parts, it is a sign that matter is gathering, and an Impothume breeding. Wherefore, lest the matter turn inwards, eat holes, and corrode the inward parts, and by these means cause death, or tedious diseases in the Patient, the place must be timely opened; for when the place is opened, the matter runs out with ease. They think that Emollients and Suppuraters doe little good.

VIII. We must take notice also of what *Paracelsus* tells us, how in a Contusion of the Muscles, especially about the ribs, the flesh swells, and becomes as it were mucous; so that if it be prest, it makes the air flatulent, with a small hissing, and the prints of one's fingers remain in it. Then in the space, which the flesh parting from the bones has left, a purulent matter is left, which causes the ribs to perish. If this happen, we must timely prevent the mischief, and the part must be bound very strait, and then *Oxyroceum Diachylum*, *striatum*, or the like digesters must be used.

IX. Some

Sennertus.

IX. Some Noblemen in the River threw Water one at another; one of them that had stirred himself most violently, had a great pain in his left groin, and at length an *Ecchymosis* in the same place, a span long, and five inches broad, which was a certain argument that some Vessels must be broken. Therefore the cure of broken Vessels was entred upon by *Unguentum herbaceum* inwardly and outwardly, *Pulvis ad casum*, *Pimpinellæ* and *Oxyroctum*, presently the pain ceased, and the concrete blood exhaled.

X. You may often see, upon a Contusion of the fleshy parts of the body, abundance of blood extravasated in their interstices, which you may find to fluctuate by the touch of your fingers, and you may sever it, as in abscesses; but you must consider, that to treat this as an Abscess is not always successful. To go to work by Discutients were tedious, and by driers would be more difficult; but to efficacious and expeditious Chirurgery it is easie. That is, if you thrust a Penknife, or sometimes a broad-pointed Lancet into the Skin: for so, and by squeezing it a little, the grumous blood will start out wonderfully. Which was verified in a Carman, that was kicked by a Mule, and had his Arm bruised, swelled and pained, who came to me, and was this way successfully cured.

XI. A Man of about 36 years of Age, of a lean constitution, by accident of a fall, near two stories high, into the Street, was sorely bruised, especially on his left-side, hip and arm. I immediately let him blood largely, and embrocated the parts bruised, *cum oleo ros. myrt. & aceto*, and applied astringent Emplasters. A Clyster was also prescribed, and Irish Slate, &c. was given him, whereby he was disposed to a breathing sweat: and at the hour of sleep an Anodyne draught was prescribed, to incline him to rest. By this method the fluxion was checked, during which the parts diseased were fomented with a decoct. *summitat. absinth. anethi. majoranæ. flor. cham. sambuci. sem. anisi & cumini*, to which was added *Spir. vini*. Embrocations were also made *ex oleis aneth. rutæ & terebinth.* and the Cerote above proposed was applied over them: and in progress of time he was cured.

XII. To them that are employed in the cure of outward Ails, there often occur Ulcers, which lie hid under the Skin, a little discoloured, and something exasperated, unity being broke; which in cacoehymick or cachectick bodies gives a painfull suspicion of it self, and which may either pass into some cavity, if any such place be there, or of besetting and putrefying the bones; or the Muscles and Nerves, or if these or any joint be underneath, there is fear of loss or lameness, or of a perpetual feebleness. Which it is a prudent Man's part to prevent; because the force of corruption is admirable, if it remain there any time. For I have seen, where the Skin has been whole, and where it has not been touched by the abscess, pieces of flesh, ill cured, have withered, and likewise whole torous Muscles, and long tendons, &c. Yea, and solid bones have lost their rigour, and natural splendour. I have had eminent examples of this matter. Which, indeed, as it is wonderfull in exactly putrid Ails, so it is much more admirable in Contusions and *Ecchymomas*, which if indeed they fall upon the nervous parts, and be not at the first exhausted and dried up by Medicines, when the flesh, and vessels, and fibres of other parts, do both languish with the bruise, and are a little poisoned with their own juice extravasated, the bones which are fenced round, being not sufficiently defended by their own small heat and slender vigour, and being deprived by degrees of their temperament, wax black, which is the last sign of absolute mortification. This was the case of N. whose hand was bruised with a stick, and when the *Ecchymoma* had been ill cured by others, and was just turning to an Abscess, I opened it, and found it putrefied a great way; and after the ri-

sing of a great Swelling, it created me no small trouble in the cure, till the *ossa phalangis* were laid bare, and appeared black. And he was cured of the Abscess of the Bones with much adoe.

Severinus,
Med. Eff. p.
107.

Medicines especially made use of by eminent Physicians.

1. This is very effectual. Take of Flower of Fænugreek 1 ounce, of Frankincense, Myrrhe, or Lucca, each 1 drachm, Goat's-dung half an ounce, Salt 2 drachms. Boil them in Wine. Make a Plaster.

Platerius.

2. For this purpose some, which is an excellent remedy for them, especially that are beaten; do wrap the Patient in a Sheep-skin newly slain, while it is hot, bestrewed with Salt, Powder of Myrtle-berries, Garden-creffes; or if a Sheep-skin be wanting, let the Patient be anointed with Oil of Roses, Myrtle, Worms, to which may be added Powder of Red-Roses, or Myrtle-berries. ¶ And the Root of Solomon's-Seal is most efficacious in curing bruises, which either fresh, or in Winter-time, steeped in Wine, and bruised, and applied in form of a Cataplasin, often in one night, takes away the Sugillation, so that the natural colour returns to the part affected. ¶ Also a rank Nut bruised is commended. And if the extravasated blood cannot be discutied by other remedies, cupping-glasses, if the place will bear them, must be applied, which are a most effectual remedy to draw out whatever is contained deep in, and if there be occasion, Scarifications must be used, that some of the blood may manifestly be discharged.

I. What can be expected from giving a Purge, when the peccant matter can onely be discharged by spitting? But, Hippocrates, lib. de int. affect. Purges by Mare's-milk, and sometimes by Asse's. And Trallianus beside these, in some cases, allows of Goat's and Cow's Milk; and justly indeed, because from Milk we have the cleansing of the

Body, and the cooling and tempering of the Humours, all which things are desired in suppurated persons; for the cleaner Bodies are, the less sick they are, tempered humours doe less harm, and when the habit is cooled, Fevers are less afflicive. Wherefore, I commend such a kind of Purge; but for this a great quantity of Milk, that is, three or four pounds must be given: And what *Hippocrates* did every day, that we must doe at several turns. But if the use of Milk do not please, or the Patient refuse it, for this same Purging we must make use of *Manna*, *Cassia*, Solutive Syrup of Violets; and the like, which are proper to evacuate, cool and temper.

Pet. Sallius
Divertus,
com. in text.
7. l. 1. de
morb.

II. Urinary Medicines are usually powerfull remedies; for that Catarrh, which falls down on the Lungs, and there putrefies, does not take its rise from the head onely; but sometimes it is cast off by the whole venous kind, upon some weak part. Therefore Sweat and Urine is a present remedy for it: And a decoction of *China-root* with Scabious, and other things proper for the Breast and Urine, will doe good.

Heurnius.

III. If the Abscess break not, Practitioners bid us give such things as may break it. But they do not reach to the part affected. It were better to apply Medicines to the side, which might draw outwards, and afterwards open it with an Instrument, or Caustery, that the matter may purge outward, and not break inward: for breaking inward would be dangerous for fear of choaking; and when it was broke, the matter could not conveniently be evacuated. And when the Lungs are exulcerated, Men become consumptive and die.

Rondeletius,
l. 2. c. 15.

IV. In the choice of Medicines we must have respect to the matter which must be expectorated. For if the Pus be bilious, sharp and corroding, we must chuse such as mitigate and allay acrimony; as Barley, Jujubes, Raisins, and the like; If the Pus be not sharp, but thick, then attenuating and inciding Medicines must be made use of, as Hyssop, Coltsfoot, Elecampane-root, &c.

Sennertus.

V. The insensible drying and consumption of the purulent matter is usually attempted by drying and resolving Decoctions; from which, seeing more hurt may be feared, through increase of the leanness and Fever, than good, by consuming a small portion of the matter; therefore we deservedly omit this sort of remedy in this case.

VI. Instead whereof I should more willingly give Sulphureous Waters, both Purgative and Diuretick, if they were at hand, for several days, to dry up the Lungs, and carry off the matter both ways. But in defect of them use may be made of a decoction of the Root of Elecampane, Liquorice, and *China* also, if you can have good, made in distilled Water of Coltsfoot, Lungwort and Maiden-hair, about half a scruple of Spirit of Tartar, and Spirit of Turpentine being added for one time; where to may be premised a Bolus made of Salt of Urine, Butter of Sulphur and Turpentine.

Foris, com.
sult. 41. cent.
2.

VII. External Expectorators must not be neglected, and the Muscles of the Breast must be freed from tension and hardness by anointings and fomentations; Yet we must not insist long upon them, lest the strength of the Muscles, which is here very necessary, be spent; and by reason of laxity the chest be again made liable to fluxions.

Rondeletius.

VIII. Tapping is more dangerous, than is commonly believed, for seeing the Lungs always play on the inner superficies of the Breast, and in expiration is but a very little way from it, they can scarce avoid the edge of the Knife: And then the matter cannot well get out. At last, if the matter get out, to me it is probable, that it proceeds from the very Lungs, after their Coat is wounded; which is the reason, why the Physician rarely obtains his desired end, and the Patient, for the most part, dies quickly after.

J. Van Horne
Microtech. p.
2. Sect. 18.

IX. Unless the strength of the Patient be very good, or indifferent, tapping must be omitted, lest when the Patient dies, a remedy, otherwise the most noble and safe, be defamed. And Physicians measure for the most part the strength by Pulses, which yet may deceive the Physicians in this case, since the matter in the Breast of a Patient, that is yet strong enough, may cause Pulses, that argue lowness of strength, namely, a little, swift, frequent and inordinate one. But it is a most certain sign, the strength is good, when a Patient can sit or walk, and that either by the benefit of a strong nature, or by the help of some Staff.

Scultetus
Tab. 35.

X. The matter of an Empyema must be let out by little and little, and at several times, that is, every day six ounces once or twice, as the strength of the Patient can bear it: for if they who let out all the matter together at one time, do not die spent, yet because of the sudden change of nature, they must certainly expect a greater Empyema than the former; for Nature, if the matter she was accustomed to, be evacuated all at once, transmits many humours from the rest of the Body, to correct the Vacuum that was so suddenly made, so that a greater and worse Empyema than the former must arise.

Idem, ibid.

XI. This must in the first place be considered, whether the signs that the Disease is made be certain or dubious: In the former case there is no great need of Pharmacy, but onely of a prepared body, and you may straight proceed to the opening of the side. Therefore, if after a Pleurisie, or Peripneumony, or blood run inwards after a wound, there be any fluctuation of Pus, or purulent matter, or blood within the cavity of the Thorax perceived, with no spitting, or diminished, there is no necessity for our tarrying any longer upon ripening, or expectorating Medicines; but we must proceed to tapping: In tender and timorous people a caustick may be first applied between the sixth and seventh rib. But if the signs of this disease be not so very certain, and altogether dubious, we must not fall too soon and rashly upon tapping: For in some that spit out purulent matter, with great difficulty of breathing, and straitness of Breast, I have known Tapping celebrated, not onely to no purpose, but to hurt. Therefore when expectorators, and gentle diureticks and sudorificks have been used in vain, we may proceed to Tapping.

Willis.

XII. *Hippocrates* used burning to all that were suppurated, when they had gathered Pus in the Thorax, or in the region of the belly: and when burning is not sufficient, he proceeded to penetrating section. And truly I persuade my self, this cure would be very beneficial to many, were it but administered in time. But now it gives help to few or none, because either it is not done at all, or much later than it should be done; partly because Physicians themselves are afraid, as if it were some great matter; partly because Patients will not obey them, except they plainly see they must die, and then they give way when it is too late: But the seasonable use of such things, is, while the Patient has yet strength to bear them.

Vallesius, l. 5.
Epidem.

XIII. *Hippocrates*, 6. apbor. 27. commends Tapping; and *Galen* gives it his Vote, nor without reason; for wounds of the Breast are not mortal of themselves, and there is not a more convenient passage open for the purulent matter: So that the several attempts for evacuation of the matter, by Vesicatories; or, as *Paul* will have it, by several Burnings made in the skin, that the matter may be drawn to the external Muscles, are fruitless, because of loss of time, which is attended by loss of strength. The experience of both the ancient and modern make it clear, that several have been saved this way. *Marchetti*, in *sylloge observat.* 44. has an illustrious example. A Nobleman of Padua, saith he, after a Pleurisie that was not well purged, fell into an Empyema: So much Pus was contained in the cavity of the

the

the *Thorax*, that twice or thrice a-day he fell into a *Lipthymy*, next to a *Syncope*: I propounded cutting between the fifth and sixth Rib, commended by all Authours, and by my own experience often administered with good success, which the next morning I performed between the fifth and sixth Rib (some condemning it for fear of hurting the intercostal vessels) and put in a Tent thick enough, which might keep the hole open: I drew it out about evening, and with it above three pounds of Pus; after which N. was well of his *Lipthymy*: Which I afterwards cured, as other wounds of the Breast, that is, every day drawing out the purulent matter, and a few days after putting in a Leaden pipe, through which all the matter was wholly drawn out. Which at last, being drawn out, I brought the wound to a *Cicatrice*, at length, in the space of twenty eight days.

XIV. There is a great disagreement in opinions about the place of Cutting, some chusing the space between the fourth and fifth Rib, others that between the third and fourth: And the latter opinion evidently preponderates, as to getting out most conveniently what is troublesome to the diaphragm: But the case in a live and a dead man is far different; because in the living the diaphragm is lifted up much higher than in the dead: but in a suppuration of long continuance the expulsive faculty so languishes, or rather is so dead, that it delivers its burthen much more easily down-hill than up. A publick Hospital sometime saw this in an unfortunate man, from whom cutting above brought out no Pus, but cutting below, after he was dead, brought away much.

M. Tulpius,
l. 2. lib. 5.

Moreover it is necessary to find the distance of Latitude: For if Section be made towards the Back, the thickness of the Muscles of the Back, the multitude of Tendons, and the passage of the Nerves from the Spine shew danger: If you cut forward toward the Breast, it is to be feared you may hurt the diaphragm; or, if you miss that, you may not be able (because of the activity of the diaphragm) conveniently to purge out what will be apt to fall backwards. That you may shun these Rocks, take a thread, and measure from the tip of the Breast bone to the top of the *Vertebra's* of the Spine. Then divide this into three parts, and at that place whither the two third parts of the thread reach (beginning from the Breast-bone) there will be the very place for Tapping.

Jo. van Horne
Microtech.
p. 1. sect. 18.

¶ *Paulus*. l. 6. c. 44. opens the Breast between the fifth and sixth Rib, reckoning from above: But *Hippocrates*, l. 2. de morbis, opens between the seventh and eighth Rib, reckoning also from above. In the place cited indeed he names the Interstice of the third and fourth Rib for Tapping, reckoning from the last below upwards: Yet, because he reckons not the twelfth Rib, as being difficult to find, and begins his account from the eleventh exclusively, this place jumps with the Interstice, which is between the seventh and the eighth. This place of *Paulus* in some does usually make a right perpendicular line with the Nipple of the Breast. *Hippocrates* chuses the eminence or bending of the Ribs; yet, to avoid the nervous Muscles, he makes not his incision upon it, nor behind, towards the Back; but a little forward, toward the *Sternum*. Indeed in this place of *Hippocrates* the diaphragm seems to be in danger, but is in none, because, being depressed by the quantity of matter, where it sticks to the Ribs, it comes not so high as to be hurt by the Knife. In the same side, where matter is perceived gathered, the Tapping must be made. If therefore it be felt on the right side, tap on the right; if on the left, tap on the left; if on both sides, tap on both. Of the recounted places, that of *Hippocrates* is certainly the best, because Pus, or any other matter gathered in the Breast, may this way better run out, because of the more declivous site of the opening, than in that of *Paulus*. Yet that of *Paulus* is not wholly to be de-

spised, since, the matter a little more narrowly considered, in the right side *Paulus* his place seems preferable to that of *Hippocrates*, because the Liver, by its gibbous side, drives the diaphragm upwards. In the left side, if the Chest must be opened on that, because the diaphragm, by reason of the lower site of the Spleen, rises not so high, and is depressed by the store of matter, either *Hippocrates* his place must be made choice of (wherefore *Hippocrates*, l. 2. de morbis, says, It were to be wished, that the matter to be evacuated always settled on the left side) or the middle one between it and that of *Paulus*. ¶ Two things should be taken care of in the choice of the place; First, that nothing (which may any way endanger the Patient) may be hurt in the Chest, that is, the *Pericardium*, Lungs, Diaphragm, Veins, Arteries or Nerves. Secondly, that Pus may conveniently be evacuated by the place; where the section is made. ¶ I saw one, who going about to cut the Muscle of the *Thorax* between the fourth and fifth Ribs (though I had ever rather doe it, being taught by long experience, between the fifth and sixth, or rather below the membrane which clothes the sixth underneath) cut through the very *Pericardium*, whereupon he fell in a Swoond; and, when the Chirurgion came the next day, he found him dead. I saw another make a hole on the right side, so wide, that I could easily have put three of my fingers into it, whereby both the *Vena azyga* and other Veins were cut, so that the poor man expired under the Chirurgion's hand. There lives now at *Liege* a Tailor, who by my advice, when he was almost choaked with the quantity of matter, was cut by a skillfull Chirurgion between the fourth and fifth Ribs; and twenty days after he was cut, as he should, below the sixth, and he quickly recovered.

S. ulricus
Tab. 35.

Scapular

Heur. 28
Heur. lib. 225

XV. As to what concerns the place where this Section should be made, the Learned are at no small variance among themselves; and the reason of this thing may easily be imagined: for sometime the diaphragm lies higher in one Man than in another, so that this is the reason, why the humours, that fall upon the diaphragm, are found higher in one Man than in another. 2. Some have a protuberant Breast, others a flat one, which also causes a great alteration. Besides, the Lungs often stick so fast to the *Pleura*, that the Pus cannot easily fall down upon the diaphragm, wherefore you do not doe well, if you cut the lowest place about the diaphragm. And although both in this and other Tumours the highest place be reckoned the fittest for opening, it is not impossible, if the Disease put the Chirurgion upon it, to chuse sometimes one place, sometimes another for the most convenient. Upon this score *Hippocrates*, *Guido*, &c. open the Breast between the third and fourth Rib, reckoning from below; *Flenus*, *Riverius*, &c. between the fourth and fifth; *Vidius*, *Aquapendens*, &c. between the fifth and sixth; which place seems to them and to us the safest of all: for if you cut higher, you endanger the *Pericardium*; and if lower, you will hurt the Diaphragm, as very sad examples of this matter have made it evident to us. But in this troubled water of Discord among Writers, the Signs now proposed will conduct you safe to harbor.

XVI. In the inner part, on the under side, the Ribs are a little hollowed by a *Sinus*, where they receive an intercostal Nerve, Artery and Vein: This *Sinus* is especially considerable in tapping Empyick persons; for we must have a great care that we hurt not the said intercostal Vessels. *Bartholinus* writes, that this may be avoided, if Section be made from above downwards: For so *Otho Heurnius* did of old teach us, who for this Section required a Knife on one side sharp and cutting, on the other blunt, and he would have it so thrust in, that the blunt part should be towards the lower part of the upper Rib, that is, towards the aforesaid

Barbette
Chirurg.

mus, and the lower sharp part should be forced downwards to the top of the lower Rib. But practice and experience teach, that all this Doctrine is more theoretical than practical, for in a living Man the Ribs are not so far distant one from another, that a Knife can conveniently be thrust in athwart from the lower part of the upper Rib to the top of the nether. And therefore, that the said hurt of the Vessels may be avoided, I use to order the Chirurgion to make his Section in the upper part of the Rib, lengthways of it, and not going upwards toward the Rib next above it. Some say, that by this way the transverse Fibres of the intercostal Muscles are too much cut, as if they remained unhurt in the former Section. All the Fibres of these Muscles are oblique, and the inner lye cross the outer, so that whatever way Section be made, the hurting of the Fibres can no way be avoided; which also need not greatly be feared, since in this case no great wound is inflicted, and experience shews, it may be healed again with small trouble: for in this manner I have several times administered this piece of Chirurgery with good success.

De Diemer-
broeck, A-
natom. l. 9.

XVII. If the Ribs be strong and broad, and not small, and the Patient elderly, then I would bore a hole in a Rib with a Gimlet, and this operation would be safer than any other, for the Vessels that arise from the lower part would suffer nothing, because the hole should be in the middle of the Rib, and the matter might go out freely; and there would be no danger of a *Fistula*, though the matter should run for a whole year; and then the Lungs and Chest would suffer less from the external Air. Hippocrates, lib. de int. affect. intimates, that this operation is very safe, because no flux of blood can be feared.

Epiphanius.
Ferdinan-
dus, hist. 32.

XVIII. The Readers must take notice, that this operation is often performed according to art, and yet no egress of Pus perceived, because it sticks, not floating upon the diaphragm, but enclosed in a bag, made by the connexion of the Lungs with the succingent membrane. ¶ One had been long ill of an *Empyema*, at length sagacious nature seeking an out-let for the Pus, produced a Tumour on the side, which once perceived, the Physician ordered the opening of it, nothing run, contrary to expectation; wherefore the Patient was left, to regain strength, he slept upon his fore side (because they cannot lye upon their sound side, by reason of the abundance of Pus that lies upon the *Mediastinum*) but in his sleep all the Pus ran out: And when he was asserting that he was cured, because he could breathe better, he died suddenly. Here Chirurgions may be admonished, never to leave abscesses open, without a Tent; because although nothing burst out of them in the operation; yet, because they reach not the matter, the Pus, seeking a passage for itself, finds the next hole, and so, for want of a Tent, runs all out, and sudden death follows. ¶ If the wound be narrower than you would have had it, or the matter be thicker, then it must either be sufficiently dilated, with a crooked incision Knife, that has a Silver button at the end of it; or the matter must be attenuated by injection of Honey and Wine with a Syringe, and drawn out. Yet in extreme danger of suffocation I should prefer dilatation of the Wound, which is done quickly and safely, far before injection of Wine and Honey, which must needs increase straitness of Breast, the matter not being diminished before.

Petrus Bo-
rell, of f. 72.
cent. I.

Scultetus,
Tab. 33.

XIX. When nothing would doe good, and I was thinking of opening the Breast, and when the thirtieth day was over since the breaking of the *Imposthume*, I proceeded to smoking of Tobacco, after the usual manner, in a Pipe, and to take the decoction of it hot, with Sugar, upon which there followed a wonderfull excretion of Pus by cough, and in great quantity, and it was onely used twice; Take of Leaves of Tobacco 1 ounce; boil them in

2 pound of sweet water, till half be consumed; add in the end some Leaves of Mallow, Branc urfin and Violets. Strain it, and give it often.

Epiph. Fer-
dinandus.

XX. The *Mediastinum* in Man has not so great a cavity as in Dogs and other Creatures. It happens sometimes that purulent matter is gathered within its two membranes, after an Inflammation, which cannot be cast out by the Lungs. Therefore we are forced to pierce the *Sternum* with a Trepan, that so when a hole is made, the Pus may be got out by the help of Tents, Sponges, and other Instruments.

Barbette,
Chirurg.

XXI. Here also we must observe, that sometimes an *Empyema* is contained in its proper coat, and so it comes to pass, that it bewrays it self outwardly by its Swelling; and then it is called by the Latines, *Vomica pulmonis*, i. e. an *Imposthume of the Lungs*. In which case, do not expect, the coat should break of it self, for afterwards the Pus, running all about, is drawn with more difficulty out of the Breast; but the first opportunity you have, open it, and chuse no other place, than the most prominent part of the Tumour.

Idem.

XXII. Although this that I propose be a hazardous Remedy, yet, if we would leave talking, it is a most excellent one. The intercostal Muscles of the *Thorax* must have a potential Cautery applied to them upon the diaphragm, between the fourth and fifth Rib, till an *Eschar* large enough do arise, which will be in about three hours time; then it must be opened with a wound wide enough, and this is therefore needfull, lest if Incision should be made without such a Cautery, the wound should close sooner than it ought: for it is necessary the lips of the wound should be a good distance one from another (which in a round wound is most certainly true) that the outlet for the Pus and filth may be the freer. But care must be taken that the Pus run not all out at once, with respect to the Patient's strength. I have seen some cured this way, to a wonder.

Bontius,
Med. Indor.
c. 13.

Medicines especially made use of by eminent Physicians.

1. I have cured several who have been given over for dead, with this Juice; Take the reddest Leaves of a fresh Cabbage, chop them, put the Milk in a Pot, boil it close covered. This Liquour may be given morning and evening with Sugar.
2. This Decoction has an admirable virtue in breaking an *Imposthume* in the Lungs; Take of Hyssop-leaves 2 handfulls, Squill 1 ounce; boil them well: then take of the Decoction 5 ounces, Syrup of Horehound 1 ounce, Oxyssel of Squills half an ounce. ¶ Also Horse-dung mixt with Honey or Oxyssel of Squills, and applied to the Breast, is very good.
3. Two drachms of Venice Turpentine washt in Barley water, mixt with Liquorish powder, is very good: But it must be ripened, discussed and cleansed.
4. When the *Imposthume* is broken, that the matter may be raised by spittle, and the Ulcer cleansed, Honey and Water wherein Turpentine has been washed, or an Emulsion of Turpentine, is very good.

 Medicines.

I. *Petrus Saliv. Diversus, l. de affectib. partic. c. 3.* proves clearly that the Epilepsie is caused by Blood, from *Hippocrates, 4. acut. tom. 23.* He judges the cause to be an Irruption of the blood into the upper parts, and a Repletion of the vessels of the brain made on a sudden, which being of a heavy nature, and it may be also of a molesting quality, causes the Epilepsie, while nature rises to the expulsion and discusion of it. *Hippocrates* in the same place calls that Oppression of Blood, *ἡ ἀπὸ τοῦ αἵματος ἐπὶ τὸν ἄνω λόγος*, in *Epidemio, αἰματωρὰ βρογχίτις*. *Foësius*, in his *Oeconomia*, translates it, the stopping of the Blood flowing with violence and swelling. By which words *Hippocrates* intimates, the interrupted Circulation of the blood was known to himself; as is clear from his Book *ἡ τρεπὸς*. Nourishment passes to the Hair, and Nails, and to the outmost superficies of the Body, from things within; and from things without, nourishment passes from the outmost superficies to the inner parts. And since the innate heat goes in danger of being extinguished by this Repletion of the vessels, through the abundance that threatens Suffocation, no other Remedy to prevent so great a danger seems to be indicated, than plentiful Blood-letting. *Saliv.* in the said place, does therefore assign the very same Cure to an Epilepsie, when it is bred, as to an Apoplexy, which arises from the same cause, that is, plentiful Blood-letting in the inner Vein of the right Arm, according to *Hippocrates* his opinion, in the forequoted place. ¶ Yet, at this day, saith *Sennertus*, scarce any one would advise or attempt any such thing in the very Paroxysm, seeing at that instant neither Blood can conveniently be let, nor, if it could, were it (in his Judgment) either safe or beneficial; by reason of the violent contest between Nature, which is then highly oppressed, and the morbid cause, as the hurt in respiration and other actions, by reason the influx of animal spirits is interrupted. The Physician therefore might incur the censure of rashness, and pay for it with disgrace, if the Patient should dye, upon letting blood while he was in a Fit. ¶ It is the part of an experienced Doctor (saith *Paul Barbet*, in his *Praxis*) to

distinguish a-right about letting-blood in a Fit. ¶ I, and other Physicians with me have observed, that, taking away a little blood in the fit has sometimes done good, namely, to get motion in the Blood, which is as it were coagulated by an austere Acid: otherwise Blood-letting, both in the Fit and out of it, does, in a manner, always so much harm, that the fits grow more violent every day after Bleeding, saith *Deekers* in his Notes upon the place.

II. In the year 1675. a Noble Boy of Berne was upon a Fright taken with a cruel Epilepsie, his face was red and swollen, and when his Fit had held him already three hours, by my advice, and *Dr. Cramer's*, the Cephalick Vein in his left Arm, was opened, whence the Blood sprang with such violence, that one might have taken it all away in the twentieth part of an hour. The Fit was then presently over, and the next day he was well, without any Relapse. A red hot Iron had been applied to him a little before. ¶ *Hippocrates, 2. Epidem. sect. 5.* bids us open the inner Veins, if the Disease be very violent. ¶ A Girl about twelve years old was frequently taken with an Epilepsie, and when she was taken with a Pleurisie she was several times let blood, and from that time was never troubled with her Epilepsie. Hence you may gather the efficacy of Bleeding in this Disease. ¶ A Boy eight years old was taken with an Epilepsie from Plenitude, and when all other Remedies had been tried in vain, he was let blood in the Arm several times once a month, and recovered, through the great alteration of his Body, by this Remedy: which nevertheless should scarce be allowed, except in a Disease by consent with the venous kind, and exceeding hot Blood.

III. *Ben. Sylvaticus* cured a middle aged Nobleman of an Epilepsie, by opening the hæmorrhoid Veins once a month.

IV. A young Man about twenty five years old was troubled with the Falling-sickness once a month, I opened one of his temporal Arteries, and when he had been free from it four months, and there was hopes he would be well, he brought it upon himself again by drinking strong Wine, which was his custome. ¶ A Man about forty three years old had frequent Fits, a Wind running up from his Hand to his Brow upon the same side: From whom I (guessing it came from some habitous cause) took three ounces of Blood. But the bandage being loosed, much Blood ran out, after which fortuitous evacuation, notwithstanding he was well a long time after, so that he seemed cured. ¶ *Alphonfus N.* a very melancholick person, who from a child had been troubled with this Disease 9, 10, 15, 20 or 30 days together, in nature of a certain light vapour, ascending gently from his Arm to the upper parts, was very much relieved by Bleeding in the temporal Arteries.

V. *P. Merenda* writes, that in a very violent one, that comes often in a small interval, and will not yield to Remedies; he has, by applying Blisters to their Neck and Shoulders, brought several to the former use of their Reason in a short time, and freed them of their Fits, who afterwards by orderly cure were restored to perfect health. But observe, that they, as also Issues and Setons, should be used onely when the Disease is essential to the Brain; and after Purging, except the Disease be very urgent.

VI. By a Seton, according to the opinion of that most Learned Physician, *Hollerius*, I cured a young Man about twenty years old of the Falling-sickness, who had frequent Fits of it before; the ichorous matter, as it may justly be believed, which fed the Disease, being by this means derived. ¶ An Epilepsie succeeded the Cure of a Ring-worm from a hot humour in a Gardiner, which by *Spigelius* his advice was cured by putting Hellebore root into a Seton in his Arm. ¶ Yet it is not always safe to put Hellebore root in a wound; for while

p. 621.

pain encreases by attraction of the humours, the strength sometimes wasts, according to my own and others observation.

VII. I resolved to open another Issue in the left Arm, because I understood, a Disease of so long standing must now be in the Brain, for it is certain the brain abounds with these juices, for which purging by the Belly seems not sufficient. Which remedy was of that power, that from thence forward he fell more rarely into fits, and they were milder, so that those who were by, accounted him perfectly cured.

Mercatus,
conf. 3.

VIII. *Adr. Spigelius* tells of a Nobleman who had often struggled with an Epilepsie for twenty one years, and when *Aquapendent* had trepanned his Skull for a grievous fall, he had got down a pair of stairs, he was never after troubled with a fit. Therefore *Rondeletius* does not without reason approve of this remedy for a confirmed Melancholy in the Brain, though *Forelius* think it dangerous.

Rhodius,
Obs. 66. l. 1.

IX. *Erasmus* disapproves of rubbings in the fit, because the draw nothing from they place affected, and because the numbness of the Limbs admits not of their virtue: But the reason they are made use of is, that the drowzy senses may be recalled to their office, which thing violent rubbing in the Shoulders, Arms, Back and Thighs, with a coarse cloth, doth perform effectually. Moreover this advantage accrews, that the parts are thereby heated, and the humours and Spirits drawn thither, whereby there is a retraction made of the vapours, that are creeping upwards, to the lower parts, because of the rubbing, upon which restitution of the senses follows.

X. Whereas some set up the Sick, keep their Arms and Thighs wholly from the Convulsive motion, or strain them into this or that posture: Farther, whereas they blow sneezing up their Noses, and pour strong Cordials into their mouths, or use cupping and scarifying, and by other modes of administration treat the caducous but roughly, and disturb the manner of the Paroxysm; this course, I say, is often followed amiss, because by this means Nature has a double trouble, one from the disease, and another no whit less from the by-standers and attendants; when it had been far better, that, the fit being suffered to take its own course, the Patient had been onely one way afflicted.

Willis.

XI. We must take notice that the usual Purges must be made use of frequently, that is, once or twice in a week, and the course must be continued for several months; yea, sometimes we must go to the stronger Purgatives, according to *Masfarius* his rule, who says, that the Epilepsie is seldom cured, because Physicians are always upon gentle means. For this reason Chymists are wont to give the usual Purgers, which draw the humours from the most remote parts. If a happy event may be expected from such Medicines, it depends especially upon *Mercury*, calcined either with Gold, or by it self in a sand Fornace, with a long regiment of fire, taking especial care, that no part of it remain crude and volatile, which would give a great violence to the Medicine, which would otherwise purge gently enough if four or five grains of it be given with *Pil. Coch.* or rather with some phlegmagogick Extract.

Riverius.

XII. *Septalius* says, he never saw any relieved by a Vomit, but that he observed, they were all made heavy headed. Reason tells one as much, because a Vomit disturbs the head more, which is ill already. And this is very true, where the Brain is primarily affected, or when the matter lies in some part in the habit of the Body, because this remedy gets nothing thence. And Experience confirms it, which has ever had ill success upon giving Purges, whether upwards or downwards. But if the Epilepsie hath had its first rise in the Stomach, and the adjoining places, and the humour, that is the

cause, can easily be derived thither: If the Patient can bear a Vomit, the worst that can follow will be some small disturbance of the head, which will quickly be at an end.

XIII. The success of Vomits in an epileptick Paroxysm is dubious; *Septalius* l. 6. n. 5. utterly disapproves it. Nor is it good, though it by consent with the Stomach, for it is one thing to cure an Epilepsie before the fit; another thing in the very fit; in this we deny it, for the reasons alledged by *Septalius*, in the other we have no reason to scruple it. Whether in diseases above the Throat a Vomit be of any use, although the humours seem to be carried to the head? *Santorellus*, l. 22. *Antepr.* c. 4. answers affirmatively. *Fridericus Hoffmannus* m. m. l. 1. c. 5. It is another case, when Poison, for example, Hemlock, taken into the Stomach, produces an Epilepsie; For Vomits, according to *Septalius* his opinion, would not be safe: These are his words: *Have a care you do not give a Vomit in a fit of an Epilepsie, I have seen some that have tried this in a fit, induced thereto by the Authority of some Writers, who have killed their Patients outright: For the Head being more filled by the violent motion, and the matter residing in the Brain being stirred, they bring them to a perfect obstruction, whereupon an Apoplexy usually follows.* The most excellent *Frider. Hoffmannus* also, l. 1. c. 9. disapproves of Vomits, though the Epilepsie be caused by consent of the Stomach, and although he seems to grant them out of the fit; yet in their opinion they can scarcely be given, when either the Paroxysms are continual, or invade at very short intervals. But these things are not of such moment, as to forbid Vomits; for *Septalius* seems to respect any periodical Epilepsie, even that whose cause lies hid within the Brain: and then it seems to be grounded on an opinion, that is false and now exploded by most, i. e. that the Epilepsie arises from the obstruction of the ventricles of the Brain, and in the stirring of the humours by some violent agitation caused by Vomits, even in the head, the ventricles of the Brain may easily be wholly obstructed, and an Apoplexy caused. Besides, when Vomits are given to get Hemlock out of the Stomach, they are not opposed to an inveterate Epilepsie, or one that is otherwise deep rooted, and has tired out the Patients with many fits, but to a new one. Finally, they cast out the proximate and primary cause from the Stomach, which being removed, the Epileptick fits forthwith, or within a little time, abate, and shortly altogether cease. And reason does not onely persuade the necessity and benefit of Vomits in this case, but experience also proves the same: for a Vomit immediately cured six little Girls, who at one and the same time had eaten Hemlock, and thereupon had been taken with most violent and tedious Epileptick fits; while two Boys that had eaten it at the same time, who could not be made to vomit, though they were provoked to it, died of the violence and tediousness of their Epileptick fits, who undoubtedly might have been delivered from death, if the excretion of the Hemlock roots, which Nature endeavoured, had been timely facilitated with Vomits by some skilfull Physician. *Santorellus Antipr.* l. 21. c. 10. favours this opinion, and advises to vomit, upon taking poison at the mouth, and says, the use of them is both safe and proper, because they immediately cast out the Poison. Seasonable Vomits did two Girls and two Boys good, who had swallowed Arsenick. Also from *Faber Lynceus*, *Hist.* 12. to a young man who had swallowed *Mercury* sublimate. And there is not a Practitioner, who, making little reckoning of the Convulsions, commends not Vomits, and if the case will allow it, who gives them not upon taking Poison. And use has taught, that the sooner they are given, the more speedy and firm health is restored, but if they hastened to Alexipharmacks, death was hastened, or the Disease with its Symptoms prolonged, as it happened to one in *Timaeus*, l. 7. casu 4.

Wepferus,
de cicut. a-
quat. p. 389.

XIV. If

XIV. If by reason of an Epilepsie caused by Hemlock (or Poison) continuing a long time, or having many fits in short intervals, we cannot endeavour the evacuation or expulsion of it out of the Stomach, the President of the nervous system must be averted from those tumults, and as he wanders must be reduced into the way, by such things as are usually given in fits of the Falling-sickness, and of the Mother, such as are things that awaken the drowsy Senses. Let things be held to the Nose that breathe some acrimony, made of Savory, Penny-royal, Rue, Marjoram, Flowers of Lavender, Rue, Seeds of Angelico, Rue, Lovage, Mustard, Berries of Laurel, Juniper, Pepper, Cloves, *Asa fetida*, Castor, and the like, tied in a knot, and steeped in Vinegar or Wine, Balsam, and Oil of Amber, of Rue. The urinous Spirit of *Sal Ammoniack* is excellent for this awakening, which, they say, the most excellent Dr. Sylvius always carried about him, that it might be at hand in sudden cases of this Nature. Indeed I hold such topicks near to the Nose, but by no means anoint the Nostrils with them, or put them deep in, because when they are anointed or thrust in, I have known them very troublesome a long time after, let Matches of Sulphur be held to the Nose, let the contracted fingers be opened by a strong man, let sharp Suppositories and Clysters be given, let the teeth be opened, &c.

Idem, p. 324.

XV. In an Epilepsie, (and the *Vertigo*) especially if matter be supplied from the whole, when this is first diminished. Diureticks do conveniently carry off the reliques of the humours by way of Urine, chiefly if it be sympathick, and not inveterate, which at once open obstructions, dissolve the matter, and carry it off, such as Hartman's Antepileptick Spirit, volatile Spirit of Vitriol, which is contrary to it by a peculiar faculty.

Frid. Hoffmannus, m. m. l. l. c. 12.

XVI. A Maid was often taken with Epileptick Convulsions. One who thought there was fraud in the case, and that she counterfeited the Disease, that he might detect the cheat, put live Coals into her hand: She perceiving nothing, endures all the burning of the coals. Hereupon so great a wound was made by the fire in the Palm of her hand, that a Chirurgion could scarce heal it in some months time. In the mean time a Fever invaded her, which as soon as it was kindled, all her convulsive motion ceased afterwards. For Hippocrates in *Coacis*, & 2. Aphor. 26. judged aright, that it was better for a Fever to come upon a Convulsion, because it attenuates and dissolves cold and tough humours stuffed in the Nerves, as Galen comments upon it.

Bartholinus, Cent. 2. Hist. 68.

XVII. Sternutatories may both cause and keep off an Epilepsie. The first is evident from instances of those, that by the continued use of sneezing powders (in dimness of sight, thickness of hearing, &c.) have brought Epileptick motions upon themselves: The other is evident from their efficacy, because they relieve the head, and discuss what is troublesome in it. In this place, and upon this occasion, I will relate what I have very often observed in Epileptick persons, namely, that sneezing sometimes precedes, sometimes follows an Epilepsie: For I have seen in some people, before the fit took them, several sneezings, and those frequent enough, twenty, thirty, or forty often precede, and that for a day or two, every hour, so that they have been forced to stop the sneezing by applying warm milk, and afterward this ingrate and hated Disease has followed, in as much namely as it darts its acrimony inwardly upon the meninges, and then shakes the Cover of the Brain, by consent also it passes to the out parts, and the very Nerves of the Nostrils, and is as it were shaken off by Nature, that it may free it self of this unhappy Disease. In others I have seen the Paroxysm end with this very explosion and excretion, attempted at least, in as much as the rest, which nature can subdue, and cast outwards, is dismissed and exploded another way, without any

great Vellication. Since therefore if two things do the same, it is not the same thing; truly it behoves the Physician to help Nature, yet so as not to hurt her, and therefore he should be very careful how he uses them. 1. They must be mild, for Nature abhors strong ones, and if she be forced violently upon what she would do of her self, she does it forced, and as it were against her will. 2. They must be Cephalicks, which may also strengthen the head by their sweet smell: Or things good for the Nerves, as powder of the Flowers of Lily Conval, Castor, Amber. 3. If the Patient abound with humours, and be not so very sensible, in which case the Disease may very easily be brought upon one by any irritating thing. 4. If the fit be very strong, and there be a want of sense, or a detention of the principal faculties, more than the Convulsive motion. 5. And therefore they must be given to raise one out of the fit, or in the declension of it. Hence it is that *Aurelianus* denies Sternutatories to be good for Epileptick persons.

Wedelius, de S.M. Fac. p. 210.

XVIII. I do not permit the use of stinking smells but upon urgent necessity; for it is better, that the fit should be lengthened out, and spent by degrees, than to fill and make heavy the head with stinking smells, and defile the substance of the Brain and Spirits: Therefore do not use them, unless the fit have held some hours, and other more gentle means have been first tried in vain. ¶ The main controversy is about the Agate Stone: for *Dioscorides* says, the Fume of it brings the Falling Sickness: *Trallianus*, *Aëtius*, *Pliny*, *Galius*, and others, affirm the same. *Avicen* and *Mesue* are of the contrary judgment, that it is good for an epileptick person to be fumed with Agate, and that the Oil of it is good for the same. ¶ *C. Piso* commends it highly; The smell of it, saith he, is a most present remedy, as I have experienced in several, and in that famous French Virago, Maturina, who being given over for dead by her Physicians, upon her first smelling of this Stone was raised from her Bed, and beyond all expectation ran immediately with great cheerfulness to the Table and Dice. The controversy is decided by distinguishing Epilepsies, for this fume is good in that, which vapours ascending from the womb do cause, for the virtue of strong smells is such, that they discuss hyterick Fits, if they be held to the nose: But stinking smells bring an Epilepsie, that comes of any other cause.

C. Piso.

XIX. Stupefiers of the Nerves, because by dulling their sense, they render them less affected with trouble, when they are irritated, and therefore less convulsed, if the gentler sort of them be given in grievous and dangerous Convulsions, I have often found them do much good: In which respect I think Treacle, &c. may be proper, both because it infringes the venomous power of the Epilepsie, and because it dulls the exquisite sense of the nerves, and that it is given rather for that reason, than because it strengthens the nervous kind.

Platerus, de fun. l. 1. p. 77.

XX. If it have its rise from the Womb, we must take notice, not to give sweet smelling Medicines, for they both make the head heavy, and cause the

Semmerhus.

XXI. Things that add strength to the nervous kind, are appropriate remedies, which are made of capital and arthritick simples, which since they supply the nervous kind with new strength as it were, that it may be the better able to resist, what is troublesome to it, use not improperly to be added to other Medicines, which we use in the Epilepsie. However not with the same mind or intention; but because they believed, the Epilepsie was caused by Phlegm stopping up the Brain, not onely these things appropriate to the Nerves, are hot; but in the cure of the Epilepsie they used for the most part things that might cut and attenuate thick Phlegm, and the hottest remedies. Which notwithstanding, if the Epilepsie come from the irritation of the nervous kind, because they heat the Body

U

more,

more, I observe they cure not at all; so I know by experience, they rather irritate, and promote, and exasperate the fits: And because I either found, or had it from credible persons, that they doe more good than hurt with their heat, except in a cold and moist constitution of body, or when they have moreover some other property, whereby they resist poison, or this disease; I think they should not otherwise lightly be used.

Platerus.

XXII. We affirm with *Jacchinus* and others, that a Decoction of *Guaiacum* is proper for those that are subject to the Epilepsie, because we must especially have respect to the antecedent cause, whereby the proximate is fomented and sustained. And it often consists in gross impurities gathered in the whole Body, or Brain, Womb, Stomach, &c. which do indicate Incision, Attenuation, Solution, Purging by Urine, Stool, Sweat, &c. and therefore the consumption of themselves. For these, as they are the subjects and antecedent causes, being removed, the noxious faculty existing in them is also removed, that is, the malignant Vapour, which being exalted, or raised by evaporation, does otherwise produce an Epilepsie. And a Decoction of *Guaiacum* is of great service in respect of the present indication, as by inciding and attenuating it dissolves this antecedent cause, by cleansing it evacuates, and by provoking sweat it renders the mass of blood defecate, not without strengthening of the Bowels, through its amicable, astrictive faculty connate to it. Nor is the decoction of *Guaiacum* onely usefull in rooting out the Cause, but its acid Spirit and Oil also is very good to allay and conquer a fit. We must take notice concerning Hydroticks, that they are proper, generals premised. 2. That the decoction it self of *Guaiacum*, according to the different nature of the Subject, must be prepared with things appropriate to the morbid cause; taking care especially, that in boiling it the Spirits do not exhale.

Gr. Hortius, dec. 2. prob. 9.

XXIII. There are some that take *Guaiacum* for *Lignum Heracleum Rulandi*, induced thereto both by the similitude of the name, and because he often uses a decoction of this wood in the same diseases, in curing of which he glories, that the Oil has done good. *Quercetan* on the contrary thinks it is drawn by distillation off Box wood: Others think rather from the Pine: Others from the Larch-tree, for this reason especially, because *Oleum ERACLIVM* makes by transposition of the very same Letters *LARICEVM*. We, saith *Clossius*, although we are not ignorant that the *Oleum Heracleum Rulandi* is made of Hazle wood *per descensum*, and that his Antiepileptick Conserve is made of it, not onely because Hazle nuts were called by the Ancients *Heracleotica*, but especially because *Valentinus Rulandus* writing to *Fabricius Hildanus*, *Obs. 84. cent. 3.* plainly calls the Spirit and Oil of Hazle Wood *per descensum*, *Heracelinum*: Although, saith he, the thing be so, yet I constantly affirm, that Oil of *Guaiacum* may very fitly be used in its stead. For the acid Liquor of *Guaiacum* hath the same virtues and faculties, and shews the very same effects, which he attributes to his *Oleum Corylinum*. Moreover, as experience testifies, the specifick properties of Liquors perish in descensory distillation; which being consumed by the fire, a more fixt vitriolick Spirit is elevated, together with a stinking Oil and Gum, or Refine, which as they are in great plenty in all Wood, so in their power of acting and virtue, they differ not much one from another.

Idem, l. 1.

XXIV. Let Candidates in Physick observe this, that the seed of *Poenony* is more gratefull than the root, wherefore the seed may be put in Childrens victuals; on the contrary, the root is more convenient for Clysters. It is better to use the powder of the root than the *secula*; for in preparing the *facula* of simples, their virtue is washed away with the *menstruum* that is put to them, yea, just like Ma-

gisteries, they are made like an useles *Catz*, or the *menstruum* gives them some asciticus qualities.

XXV. Candidates in Physick must also be told, that if, by God's Blessing, they would cure an Epilepsie according to their desire, they must account among Vegetables the Male *Poenony*, rare to be found; among Animals, *Castor* or *Swallows*; among Minerals, *Vitriol*, to be recommended to them as *Specificks*. Some indeed will highly commend the use of *Cinnabar* of *Antimony*; but it should onely be, where the Epilepsie is caused by Worms, otherwise in my opinion it is no convenient Medicine for Epileptick persons.

S. Pauli, 29. Bot. cl. 2.

XXVI. While it was my custom to use Oil of Amber, in people troubled with Epilepsies, Convulsions, Imposthumes in the Lungs, for those that were made purulent by a Catarrh falling on the Lungs, when I observed it was odious not onely to the Patients, but to the by-standers also; and that it was distastefull to most, by reason of its too much fetidness, whether they used it by anointing outwardly, or in Lozenges or Pills inwardly, or any way else; I have now for some years used Balsam of *Peru* in its stead, to the advantage of my Patients. I know, Chymists do now correct it, and take away the offensiveness of the smell by repeated distillation after washing it: But I have found that after washing it is much weakned, and does but little good, wherefore I think we should rather use Balsam of *Peru*, or the natural Balsam brought from *Syria*, till we are taught how to distill an Oil of Amber without stink.

Heer. obs. 17.

XXVII. A Boy fell into an Epileptick fit once a day for fifteen days together. The best Physicians thought it came from some disorder in his Head: But the more Medicines they gave, the worse the Disease grew; so that in twenty four hours he had above one hundred and fifty fits; yet they were small ones, for he had onely a little commotion of his Head, with a bubble at his Lips. Whereby notwithstanding they knew the Disease was not from any disorder in the head, but by consent with the Stomach: Wherefore when they left off to trouble him with Physick, and strengthened him, the Child grew very well.

Trincavella, l. 1. conf. 25.

XXVIII. I observed wonderfull shapes of Worms in an Epileptick Woman: as she was athirst she drank greedily and frequently in her journey, coming from *Italy*, of any Water she met withall. Her Epilepsie was very grievous, with a swelling and an ill colour all her body over. She was not relieved by Antiepilepticks. At length, upon the repeated use of my Mercurial Pills, she voided a great quantity of multiform Worms. As soon as they were displaced, her Epileptick-fits likewise ceased. *Barbolinus*, *hist. 7. cent. 4.* He also, *Cent. 6. Hist. 20.* produces the example of a young Man often troubled with Convulsions, whose cure succeeded much better, after his voiding of *Ascarides*.

XXIX. A Youth about fifteen years old had a pain in his *Pubes*, afterwards, as his pain shifted to the left-side, his Spleen grew presently ill, and from Sympathy with it, the Brain; for he fell into most violent Fits of the Falling-sickness, which came upon him onely by pressing the region of the Spleen with ones finger. Among several Remedies nothing was better than Chalybeate-wine, or black Hellebore, upon taking of which he voided so much black Choler, that at last he came to himself.

Tulpius, obs. serv. l. 1. c. 9.

XXX. An Epileptick Maid was cured by the use of Vinegar and Water, she took a gla's of it every day in the morning, and before the time of her Fit pure Vinegar. When this disease was cured, she was troubled with a pain in her Limbs, which also was cured by the use of the Bath.

Riverius, Cent. 4. Obs. 1.

XXXI. I have known some young Men, who might easily have been cured of this disease: but because they would not abstain from Wine, they became incurable. All Men know, that the Epilepsie

lepsy affects the Nerves especially. And because Wine turns sowre in all, who have an infirm Stomach and a weak Brain, and Vinegar is an open enemy to the Nerves; hence Epileptick persons may easily gather how much they ought to avoid Wine and Venus. Besides, according to Aristotle and Averroes, the Epilepsy is caused like sleep, that is, by a vapour, wherefore all vaporous things, especially strong Wines should be avoided.

Heer Obs. 24.

XXXII. It is disputed by many, Whether *Apium* be hurtfull for Epileptick persons? That by *Apium*, Parsly must be understood, no Man will question who reads a passage in *Pliny*, l. 20. c. 11. and *Galen* 2. de alim. facult. for this is the true garden or domestick *Apium* of the Ancients; and ours is the *Paludarium*, or *Apium Palustre*. *Pliny*, in the cited place, says, That if a Lying-in-woman eat Parsly, the Child that sucks her will have the Falling-sickness. *Avicenna* rejects Parsly, especially from among Meats, because, by an innate property, it causes the Falling-sickness. And others, following their steps, forbid it. *Jacchimus* is of another judgment, opposing *Galen*, and in a Counsell for an Epileptick Child, allows of Parsly. But an opinion that is held by so many learned Men, must not be esteemed a figment, it being, without doubt, founded on Experience, which must be consulted. They, to whom it did no hurt, were either not inclined to an Epilepsy, or they used it onely as a Sauce, and not as Meat: So *Galen*, in his advice, allows one to taste it at least; as he does *Alexanders* also, by which notwithstanding the head is filled, as he writes. But, the Ancients that are quoted, speak of it taken as Meat.

Sennertus.

XXXIII. In the cure of this Disease we are forced to leave the common method: For the prescriptions of the Dogmatists, in which they usually endeavour to carry off, and totally eradicate the morbid cause onely by Purges, doe little or no good in the Falling-sickness, yea, they use often to doe harm. I have known some eminent Practitioners, who totally omitting the train of therapeutick intentions, have betaken themselves to certain Empirical Medicines, without any provision for the whole.

This sort of Practice, though sometimes it succeeded well; yet it would much more certainly have attained the proposed cure, if by other Medicines also, when the body had been rightly prepared, all impediments had been removed. Wherefore the Indications about the cure of the Falling-sickness, will be either Curatory, which respect the fit, or Prophylactick, which respect the cause of the disease. As to the first, general Evacuators are scarce of use: But the thing of most importance, is, to fix the animal Spirits, that are too fierce and volatile, and to suppress their explosions already begun. To which ends, two sorts of Remedies especially conduce, that is, 1. Things that give a check to the animal Spirits, when they are apt to be unruly and disorderly, and that repell them as it were with a smell ingratefull to them, and bring them into order, which thing, Medicines endued with a Volatile and Ammoniack Salt, or with a Vitriolick Sulphur, effect; Such as are Salt and Oil of Amber, Spirit of Bloud, Hartshorn, Soot, Tincture of Castor, &c. for these taken inwards, or applied to the nostrils, often give relief, and are thought to drive away the evil Spirits of this disease, just as the fume of a Fishes-gall burnt drive away the Devil in *Tobias*. 2. The Animal Spirits are either diverted or hindered from making their explosions, when they are enticed and kept employed in some work familiar to them. Wherefore, when a fit is violent, rubbing all the body over, and continued, often does good. But the most of a Physician's care lies in preservation, that the cause of the disease being removed, or the root cut away, all the fruits may wither. The Medicines requisite to this intention may be reduced to these two heads chiefly. 1. That

the fewel of the Disease, supplied immediately, from bad blood, or the nervous juice, and more mediately, from the bowels and first ways; Then 2. That the evil disposition of the brain, and of its inhabitants, the Spirits, which is peculiar to the Epilepsy, may be removed. As to the first thing indicated, in this case, Vomits, Purges, Alteratives; Bleeding, Issues, &c. are proper, in as much as the impurities are withdrawn from the bowels and humours, and their dyscrasies amended; And although they cure not the Epilepsy, yet they remove impediments, they raise nature, and excite her to encounter the enemy; also they prepare the ways, so that Specificks may more certainly exert their Virtues. As for Specifick Medicines, onely which indeed, though not always, are reckoned to reach the cause of the Epilepsy, it is wonderfull by what power of acting they use to doe good in this disease, seeing they are taken without any sensible evacuation, or even perturbation in the bowels or humours, following thereupon. If we may guess, since we hold that the procatactick cause of the Epilepsy consists in a heterogeneous conjunction, arising in the Spirits, those inhabitants of the brain, and inciting them to preternatural explosions; it will follow, that what things resist or remove such a cause, must be of such a nature, as that by strengthening the Brain, and contracting its pores, they exclude that conjunction, and so fix the Spirits, which are up and down the middle of the brain, by dissolving their conjunction, that they will not any more be apt and inclined to those irregular explosions: Not unlike, it may be, to *Aurum fulminans*, which, if it be ground with Sulphur, or be sprinkled with Spirit of Vitriol, it loses its fulminant virtue. And indeed we may discover such properties, either one or both in most Antepilepticks: for *Pæony*, *Mistletoe* of the Oak, *Rue*, *Lily Conval*, with many others, have a manifest adriction in them, so that it is very likely, their particles taken inwards, and so carried in the vehicle of the blood, or nervous juice, to the Brain, do so contract, and shut up its pores, which are too lax and open, that for the future they do not at all lie open for any passage of the morbid matter. Moreover, because these concretes do breathe out, as it were, an Armoniack, or dissipative scent, therefore they are said to depurate the animal Spirits, and to fix and strengthen them, when they are deprived of their heterogeneous conjunction. This virtue, depurative of the Spirits, proceeding from the Sal Ammoniack, is apparent in remedies, which are fetcht from the animal and mineral families, such as are preparations of Man's skull, Bloud, Amber and Coral; as the other astringent virtue is more powerfull in the parts and preparations of Vegetables.

Willis.

Medicines especially made use of by eminent Physicians.

1. If you cut the great Toe of the sick party any where, and anoint the lips of him that is in the fit, with the blood that drops from it, he will be raised immediately, according to *Didymus*. Ætius.

2. Salt of Corals preserves Children egregiously from Gripes and fits. ¶ Pills of Salt of Vitriol are highly commended in the Falling-sickness. ¶ This is famous for the Epilepsy: Take of Cinnabar of Antimony 4 ounces, pour on it Spirit of Vitriol, first let it stand in digestion 14 days, till it become like Gold; distill it in a strong fire by a Retort, and an elegant Spirit will come out, which keep. Then take Roots of Angelico, Pellitory of Spain, Pæony, each 1 ounce, Flowers of Rosemary, Cassidony, Lavender, Lily Conval, each 1 ounce, leaves of Marjoram, Scordium, each 1 handfull, Shavings of Elk's Horn, Man's skull, Castor, each 1 drachm and an half, *Diamoschu dulcis* half an ounce; mix them, pour

to them the best Spirit of Wine, till it stand 4 inches above, let them be digested in a close vessel in *Balneo vaporoso*, till the Spirit of Wine grow as red as blood, pour it off by inclination, draw it off per *Balneum*, till it grow as thick as honey, if there be 6 ounces of it, add 2 ounces of the Spirit of Vitriol above said. Digest them in *Balneo vaporoso* for a month, keep it. The dose is one or two scruples in a little Lavender or Peony water. ¶ Oil of Wine mixt with tincture of Corals, and a few drops of it given to Children, presently take away the fit.

3. This is a singular and experienced Plaster: Take of white Amber, Frankincense, each 1 drachm and an half, *Galbanum*, *Opoponax*, each 1 drachm and an half, Mistletoe of the Oak 2 drachms, Ambergreise 6 grains, Musk 3 grains, Seed of Male Peony half a drachm, *Labdanum* 1 drachm and an half, a little Oil of Nutmegs: Besirew it with powder of Cubebs, when you have spread it, and apply it to the coronal future.

4. I can certainly affirm, that I saw an Epileptick person above twenty five years old, cured onely by the use of 2 ounces of Weezle's blood, with 1 drachm of Vinegar. ¶ Take the Stones of a wild Boar, or of a tame one that uses *Venus*, and also the Stones of a Cock, dry them in an Oven, and powder them; let there be 2 ounces of the Boar's stones, and 1 ounce of the Cock's, then add twice as much Sugar. Let the Patient take some of this Powder with all his Meat, you will find it a most absolute remedy.

5. It has been found, by frequent observation, that children have been preserved from fits, by giving them 3 drachms of Syrup of Cichory with Rheubarb, as soon as they were born, before ever they had sucked Milk. ¶ I gave my own children 2 Scruples of Juice of Rue, with a little Gold, and by God's blessing they are free from Fits.

6. Many of our Country Folks have the blood of the Epileptick Person himself among their secrets, as a singular remedy for an Epilepsie. For in the very fit they take away a little blood from a vein in his Arm, and they give it him to sup with a rear Egg. Which experiment has freed not a few from the Fit immediately, and has rendred them free from it ever after. But after this Liquor they give him Cordials and Bezoardicks, to lay him to sweat; for so the matter of the Convulsion being stirred, and disturbed by his own blood, is discolled and evacuated by sweat. ¶ A most noble and sure Antepileptick Powder. Take of Man's Skull burnt, Man's Bones burnt, each half an ounce, Powder of the Bones of great green-Lizards 2 drachms, Mistletoe of the Oak, Root and Seed of the Male-Peony, gathered in the decrease of the Moon, each 1 drachm, prepared Antimony, Hoof of an Elk, an Ais, each half a drachm, White Sugar 4 ounces. Mix them. Make a Powder. The dose is 1 drachm, with a due quantity of Water of Hartshorn, Flowers of the Linden-tree, and Lily-Conval. ¶ An Amulet for the Epilepsie. There is a branch of Elder, that grows on an old Willow, pieces whereof hung about the Neck, have very happy success in either abating, or quite curing an Epilepsie. They must be gathered in the Months of September and October, before the Full-Moon. ¶ One of the second sprigs of a Willow cut into small pieces, and nine of them tied in a Linen, or Silken-rag, hung about the neck to the Mouth of the Stomach, either before or after a Fit, and worn so long, till it breaks, or falls off of it self, is an Amulet. The rag when it is fallen must not be touched with ones hands, but taken in a pair of Tongs, and buried in some remote place, lest it should be touched by the sick, or any other, and so infect them with the Falling-sickness.

7. A Medicine diminishing the Epilepsie; I have observed, that by taking 1 drachm of the Powder of Soapwort-seed, once a Month for three

New-Moons, the Fits have abated much, either in number, or violence. ¶ I have known many perfectly cured by eating a Wolf's Liver. ¶ A drachm of Peacock's-dung in Powder drunk in Wine, when the Moon is New, is a most excellent remedy, if it be taken once a month, for some months together.

8. I have known these two Powders very effectual; Take of prepared Coriander 2 drachms, Seeds of Peony, Purslane, each 1 ounce, Hoof of an Ais burnt, half an ounce. Mix them, make Powder. The dose 2 drachms in 2 ounces of Rue-water. Take of Man's blood taken away by Cupping, of Man's Skull each 2 drachms, prepared Pearl, Galangale, Zedoary, each 1 drachm, Mastick, red Amber, red Coral, Dittany, each 1 drachm and an half, flesh of a Kite, fat Raisins, each half an ounce. Mix them, make a Powder; Add 2 ounces of Sugar. The dose is 1 drachm in Peony-water every morning. ¶ Some account this a Secret; Take juice of *Carduus Benedictus* purified, and boiled up thick 4 ounces, juice of Yarrow purified 3 ounces, Sugar 4 ounces. Mix them, boil them into the form of an Electuary. The dose 1 spoonfull.

9. The Skin of a Wolf, taken off that part which sticks to the Spine, must be cut into the form of a Girdle about 2 inches broad, it must be girt about the Belly and the Loins, and worn always, that the inside of the Skin may touch the Flesh, the hairy side being put outwards. ¶ As soon as a Mare's Foal is foaled, it vomits up some matter, which unless one take up hastily, the Mare immediately devours it. This matter dried and Powdered cures the Falling-Sickness by certain experience, it seems a wonderfull thing. Oil of Vitriol rightly prepared, and 5 drops of it taken with Broth in the morning, for several days, has cured many of this disease. ¶ I approve of nothing better, than Peacock's dung given in distilled-water of *Carduus*, or Yarrow, than which, I have found nothing more effectual.

10. Cinnabar of Antimony in equal weight with Magistery of Corals, is a Specifick even in inveterate Epilepsies; it takes away the disease onely by Sweat at repeated turns, and necessary evacuations premised. The dose is from 10 to 16 grains in some proper liquour.

11. Oil of Box is admirable; for it is Narcotick, and Narcoticks by stupefying the Sense, use to hinder the Fit.

12. In a Fit of the Falling-Sickness I give order to rub Rue between ones hands, and to hold it to the Nose, or to put a little of it up the Nostrils, for by this means I have brought innumerable out of their Fits. ¶ Let the following Amulet be hung on childrens necks; Take of green Peony-root half an ounce, of Male Peony-seeds, namely the black, 1 drachm and an half, when the Root is cut, and the Seed bruised, put them in a bag and hang them on. By this Suspendory I have seen the Fits cease to a wonder, and have often experienced the great and excellent virtue of it.

13. Dissolve the scrapings of the Whitest Amber in Spirit of Wine, that it may be tinged, filtrate it, and evaporate it to half. It is a great Secret in the Falling sickness. It may be given to 15 grains in some appropriate Water.

14. This is admirable; Take Ears of Barley, when they begin to grow ripe, burn them to Powder, of which give a little to an Epileptick person every morning in Peony-water, and he will presently be cured.

15. A certain illustrious Lady testifies, that upon the most sure experiment of a certain Widow, the Falling-sickness is cured by a Powder made of Quails-Eggs. The Eggs are dried a little, so as they may be powdered. Half a drachm of it to 2 Scruples is given for a dose.

16. The

16. The Fat of a Rabber, killed by a violent death, melted, and 4 or 5 drops of it given in Water of Magpies, or Swallows, certainly gives help. ¶ This also is accounted a singular secret; The Gall of a black Whelp that sucks (they take for a Boy a Dog-whelp, for a Girl, a Bitch) and is strangled, given in some convenient liquour. By benefit of this a Son of the Duke of Buckingham's was cured. This is much in use in England.

17. The famous *Spiritus Vitrioli Antiepilepticus Hartmanni*; Take of the finest Hungarian Vitriol 4 pounds, add thereto of Urine of healthy Boys, new made, 8 pounds; Digest them for some time in a close Vessel in *Balneo Mariae*: Afterwards in the same distill a two-fold Phlegm, the first of which is an excellent Paregorick for Gout-Pains and others, to assuage them: the other is an excellent Ophthalmick, good for all diseases in the Eyes. Put the *Caput mortuum* powdered into a strong earthen Retort, in an open fire, yet at first but very gentle, and drive it over into a large Receiver; while the Spirits come over thick, there flows out a most pretious Liquour, of a Sulphureous smell, and something austere taste, which being rectified once and again by retort, and kept in a Glass well stoppt, perfectly cures all Fits in Children. A Scruple of this may be mixt with Water of Pœony, and Linden-tree-flowers, of each 1 ounce, and kept for use. Give half a spoonfull of this said mixture in the Fit, the contracted and convulse parts being first reduced, and a little after, their senses being recollected, they will come to themselves, which, as soon as you observe, give them a little more, and so a third time. But if the Fit should come again, as it often does, repeat the same process thrice, and never fear, but at the second time, this disease, so familiar to Children and Infants, may be utterly and radically taken away; especially if some comforters of the brain be used afterwards, such as are Magistery of Pearl, Coral, Man's Skull, and our Antiepileptic Lozenges. The famous *Hofman* likewise highly commends this.

18. There is an admirable Water distilled off Daffodil-flowers, which is a present remedy for the Epilepsie, if the Nape of the Neck and the whole Head be washed with it hot; but the Oil is much more effectual, which is drawn off the Flowers with the Water, by Chymical Artifice.

19. For Fits of the Mother, let Issues be made in the Legs, which remedy I have ever so much valued, and it hath succeeded so happily, that I have freed several Women thereby from most grievous accidents, and such as would give way to no other remedies.

20. How black Hellebore cures the Epilepsie; Take green Roots of black Hellebore, extract them with Spirit of Wine, draw it off, that the Essence may remain; If Milletoe, Pellitory of Spain, and Seeds of Pœony be added, it is more effectual.

21. *Montagnana's* Electuary excels all others in Efficacy, by benefit whereof many Epileptic persons have been cured; Take of the Roots of Male-Pœony, Cassidony, *Cistus*, each 10 drachms, Agarick 5 ounces, Pellitory of Spain, Caroway, Dill-seed, *Asa fatida*, *Aristolochia rotunda*, each 2 drachms and an half, juice of Squills, and the best Honey, each 1 pound and 2 ounces. Let the Squill and Honey be boiled over the fire to a consistency, then add the Powders, and make an Electuary. The dose is 2, 3, or 4 drachms, continuing to take it for 20 or 30 days.

Epiphora, or involuntary Tears.

The Contents.

We must not use things to stop the Tears, before we Purge the Head. I.

Collyries must want all asperity. II.

A Blister drawn on the Forehead, of what efficacy? III.

It must not be cured after the same manner if it be carried by the outer Vessels, as if it were carried by the inner. IV.

Where a Seton must be fixt? V.

By the use of Oil of Vitriol one turned into a Cancerous Encanthis. VI.

Medicines.

I. WE must not use stopping Medicines, while there is a great and plentiful flux of humours; for then the abundance of humour, being intercepted by virtue of the Medicine, and stuffed as it were, it either, through its acrimony, causes greater pain, or exulceration. They must therefore be used, when either the humour is in a great measure evacuated, or the Flux of it is not great; otherwise they will doe what *Galen* 4. *met. 10. 11.* writes, *Washt Pompholyx, as also Spodium and Starch may both moderately dry up the humours, and also hinder the superfluous moisture, which is contained in the Veins, from being evacuated through the tunicles.*

II. Collyries must have no roughness in them; for things that are of this nature, although they be ground never so finely, cannot lose their nature, for they are never diluted like a Juice, but when they are even brought to their highest fineness, they must of necessity continue a kind of Powder, which as it were pierce the parts of the Eyes, and raise a more troublesome Epiphora, if they be used at the beginning. But when one has been vexed several days, and there has been a perseverance of the humour, and the Phlegm is rendered more glutinous by the heat of the Eyes, then Collyries of metallick things will doe good, for the Eyes will then bear them more easily, so they be void of exulceration.

III. In a stubborn Disease a Vesicatory applied to the forehead does good. *Forestus, obs. 11. l. 11.* tells of an old Woman, whose Eyes were bleared, weeping, full of water, painfull and itching, and was cured onely by application of a Vesicatory made of *Spanish Flies*, Leven and Honey. I had a Matron of about sixty under cure, who had had sore Eyes for six months, and when no Remedies would doe good, she was cured in twenty four hours, by applying *Schroderus* his chephalick Plaster to her Forehead: But she would not abstain from Wine through the whole course of her Disease.

IV. *Fernelius* derives the original of the Flux of Tears from the Forehead and Crown of the Head, in which he reckons the humour is gathered without the Skull, and under the Skin, which he will have to fall from the *Pericranium* upon the adhering Membrane, and so break out at the Eyes from without. But we must believe, that the Flux of the Eyes often derives its original from within, which *Paulus* has expressed; and *Rhazes* says, that this Flux may easily be cured, if it be fed by the outer Veins, but very difficultly, if the Tears come by the inner Veins.

V. In Defluxions and Weepings of the Eyes, all men agree, there is no Remedy more powerfull than a Seton in the Neck. Now *Hildanus* would have it made between the second and third, or even between the fourth and fifth *Vertebra* of the Neck. I think, the custome of *Aquapendent* and the *Italians* should be followed, who make it between the second and first *Vertebra*. For that which is made low-

er puts one to pain, because of the rubbing upon it by the Band and the Doublet:

VI. One upon the unseasonable stopping of a lachrymal Flux by the Oil of Vitriol, had so luxuriant a Gland upon the corner of his Eye next his Nose, that the excrescence of it did not onely cover his whole Cheek, but it degenerated also into a most pernicious *Carcinoma*, which a Chirurgion tried indeed to take hold on by a thred, and to cut it off conveniently with a Knife; but then the tumour had acquired that malignity, that it could scarce be touched, but it would immediately gush out with Blood, and therefore there was a necessity onely to use Lenients, by which the destruction of the Patient was deferred, rather than removed. Let them therefore consider, that so frequently use sharp Medicines, how easily an error may be committed, which by no Art can ever after be rectified.

Tulpius,
obs. l. 1.
c. 29.

Medicines especially made use of by eminent Physicians.

1. In Weeping, the Juice of Grasse of *Parnassus* squeezed out of the green herb is very good, as likewise the distilled water of *Tormentil*.
Crato.
2. Onely the Juice of *Pomegranates* boiled half away cures hot Tears.
Forestus.
3. Some commend a piece of raw Veal, well beaten, with tearing it, which they steep in Rose-water in a stone vessel, often pouring on fresh water, and they apply this Flesh to the Eyes, as the party goes to bed.
Franc. Osw. Gremis.
4. Take of Rose-water 2 ounces and an half, prepared Tutty 1 drachm, *Saccharum Saturni*, *Lapis Calaminaris*, each 1 scruple; mix them. Drop it into the Eyes.
Phil. Grullin-gius.
5. This Powder is very excellent; Take of burnt Hearts horn, twice wash in Rose-water, *Guaiacum*, *Cistus*, red Coral, Antimony, each equal parts; Musk, the fourth of one of those parts. Make a very fine Powder, which we may use, and with Wine make a Collyry. ¶ Also a Sponge wet in water, wherein the greater Pine-nuts bruised have been boiled, is very good, if the face be wash therewith.
Joh. Manardus.
6. A piece of white Vitriol dissolved in such a quantity of water, as the Eyes may bear, may be used with success. ¶ This Ointment is accounted singular for an *Epiphora*; Take of Verdigrise 12 grains, Camphire 1 drachm, prepared Tutty half an ounce, fresh Butter, which must be melted with Rose-water, and boiled a little, 6 drachms: Mix them; make an Unguent; put a piece about as big as a Pease into the greater corner of the Eye, and let the Eye-lids be lightly anointed.
Platerus.
7. In this Disease, especially if it arise from a cold humour, Water of Golden-rod, wherein burning Frankincense has been extinguished, is commended.
Sennertus.
8. This Powder wonderfully restrains Tears; Take the Shell of Citrine Myrobalans, infuse them in Rose-water for two days, dry them, and powder them; infuse them again three or four times in Rose-water. Keep it. ¶ Take dried Rue, boil it in Honey and Vinegar, strain it through a linen Cloth, when it is strained, anoint the Eyes with it, it will most certainly restrain Tears. ¶ This is a singular Remedy; Burn some Frankincense, and extinguish it often in Rose-water; Drop it into the Eyes.
Joh. Stahlke-rus.
9. This is a most experienced thing; Wash the Eyes three or four times a-day with Water wherein Gold smiths quench their Gold and Silver, or their Tongs: This will be better, if a little Frankincense, Mastick, Aloes and Litharge, be first boiled in it. ¶ And this is an admirable thing; Take of Juice of Fenil, *Pomegranate*, Sorrel, *Celandine* purified, Honey, each 1 ounce,

Beat them together in a Brass vessel, and let them stand in dung for 2 days; *Lapis Calaminaris* and Antimony each half an ounce may be added. Make a Collyry.

Erysipelas, or, St. Anthony's-Fire.

The Contents.

Respect must be had to the malignant quality joined with it. I.
Blood must be let. II.
Purging is convenient onely towards the end. III.
We must use topical Medicines with caution. IV.
It refuses Suppuraters in soft parts. V.
Sleep must be avoided, if it seize the face. VI.
When Coriander is proper. VII.
An experienced Topick. VIII.
Leeches good in an ulcerous one. IX.
An ulcerous one in the Leg cured by anointing it with Spirit of Vitriol. X.
The Cure of the Pustules by pricking. XI.
One that came often in the Face, cured by an Issue in the Arm. XII.
One anointed with Oil caused a Gangrene. XIII.
The Cure of an exulcerated one. XIV.
How Frog spawn water may be used? XV.
Medicines.

I. IT is commonly believed it has its rise from yellow Choler; but some of the Moderns rather derive it from thin blood: for, 1. The Colour is a token rather of blood than bile, which is red, when it ought to be pale or yellow, as is manifest in the Jaundice. 2. Although the Colour be vehement enough, yet it is not so sharp, as in Diseases arising from yellow Choler, wherefore it is not so frequently exulcerated, as Ring-worms and other Tumours caused by bile; and when it is exulcerated, it is not so much from its own nature, as from the alteration of it. 3. They are seldom obnoxious to it that are of a hot and dry constitution, lean, brown or black, which is most suitable to breed yellow Choler; but they rather that are sanguine, fat, fleshy and red. 4. The fleshy parts, the Thighs, Legs, Face, Neck, Breasts, and the like, are oftner affected than others. 5. This Disease comes most between thirty and forty years of age, about which time there is most blood in the body. But yet the cause must not be ascribed simply to fulness, but rather to a depraved and peculiar quality of the blood, which proceeds from the putrefaction and corruption of its thinner part: for Nature being stimulated by that malignant quality, drives the vitious humour to the outside of the body. A sign whereof is, that this Disease seizes one like the Pestilence, so that they, who never had it before, think they are taken with the Plague, till the Disease shew it self in some part. Hence it is the common practice, when the Paroxysm comes, and the Rose appears, to take Medicines which help Nature's motion, and drive the matter from the inner parts to the outer, as Treacle, Mithridate, Water or Rob of Elder. These Medicines taken in the beginning are approved on, where plenty of humours is not urgent, otherwise it is safer to remove the antecedent cause.

II. *Celsus* especially commends Blood-letting, whom *Paulus*, lib. 4. follows. *Galen*, 14. meth. & 2. ad *Glaucnem* seems averse to it. But I follow Reason rather than Authority: for it is an acute Disease, which must quickly be opposed, a kind of Inflammation, from the thinner Blood, or at least its *Ichor*, and the hottest of it; But in such a Heat who dare omit Bleeding, or fly to other Remedies, and neglect it, since it draws from the part

Sennertus.

part where the fluxion is, evacuates, helps transpiration, and readily draws out the bilious blood, as it lies in the Veins. If a sincere *Erysipelas* occur, arising from Bile alone, such as *Galen* supposes, and if a bilious Cacochymie redound in the habit of body, then Bleeding may be let alone, for fear of the ebullition of cholerick humours.

III. Although *Galen*, 13. m. m. seem to approve of Purging; yet we must proceed to it with great caution, and not till the declension, lest the humours, being stirred, run to the part affected: Wherefore, after the seventh day, Electuary of Juice of Roses with *Cassa* may be given, and after it some pounds of Whey.

IV. The Ancients, and most Writers of Chirurgery do very much use Coolers, even Water itself, the coldest of all; yea, they also mix with them Astringents and Stupifiers, as Henbane, Mandrake, Opium, Hemlock. But the Modern reprehend this common Cure, not without the suffrage of reason and experience: for since the sharp matter exciting the Rose is not without malignity, if its going out be hindered by these very cooling, binding and repellent things; it returns inwards, and seizes the nobler and inner parts, to the hazard of life, hence a Phrenzy comes from an *Erysipelas* in the Head struck in. Finally, by these things the matter is shut up in the part affected, whence putrefaction and suppuration, which is often attended by a Gangrene. Which thing since it often happens from the cure of the *Greeks* and *Arabians*, they admonish us, that the part may be so far cooled, as that the heat may remit, and the Patient confels himself not to feel so great a heat, with the turning of the red colour into a livid: But it may easily fall out, that before sufficient caution can be used in this case, such dangers may already be at hand. Wherefore the case seems not to differ much from that of Burns: For if a burnt part be dipt in cold water, it does but inclose the heat, with danger of pain and making it worse. Hot things are more properly applied, which make the skin lax, open the pores, and dissolve the ferous humours, that would break out into pustules. The intemperature of the part is removed after the same manner in both cases, not so much by opposing it with a contrary, as by taking away the cause. ¶ In this case the use of moist things is prohibited; for they presently cool actually, although they may heat potentially; and therefore they obtain the force of a repellent. Therefore dry and digesting fomentations are best. Hence it is, that if a Patient, through carelessness, wash in the beginning of an *Erysipelas*, not knowing the Disease, it will be exasperated, swelled, and the pain doubled. ¶ We must have a care of things that are unctuous and have an emplastick virtue, especially of Narcoticks; for the sharp vapours exhale, which if they be kept in, sometimes corrupt the part. ¶ It is a custome among our country people, if they be taken with an *Erysipelas*, to anoint the part affected with Oil of Bayes, mixt with a little Quicksilver, with which Medicine they prolong the Disease; for while the Oil makes lax the Skin, the *Erysipelas* spreads farther and farther, so that you may see it overrun the whole Body on a sudden, except you prevent the mischief thus, i.e. unless you apply all round it a linen cloth wet in warm water, which may defend the other parts. If the humours that stick in the flesh be plainly extravasated, they cannot flow for their thickness: let the Physician therefore make them fluid with hot Medicines. So an *Erysipelas* in the beginning is taken away by applying Spirit of Wine.

V. I have seen an *Erysipelas* in the right cheek, that was treated with suppurating Emplasticks, turn to a Gangrene. Again, I saw a Chirurgeon with such Emplasticks who was taken with an *Erysipelas* in ano. The reason is, 1. Because the Cheeks, Breasts, Nose, &c. because of their softness, are easily de-

prived of their innate heat. When therefore strength is good and the humours are hot, let Digesters, not Suppuraters, be made use of.

VI. This is a rule concerning Sleep; When an *Erysipelas* is in the Legs or Thighs, moderate Sleep is good: But when it is in the Face, we must refrain from Sleep as much as may be.

VII. Green Coriander and Barley-flower applied is a very good Medicine, but not in the beginning, because it is hot, which its bitterness shews, although it partake of moisture.

VIII. By the use of *Linimentum simplex*, not yet rank and often changed, I have cured innumerable *Erysipelas*'s with success, not neglecting universals and inward coolers. In defect of this nothing is better than Oil of sweet Almonds nine times washt in a glass-bottle with Night-shade-water, with which cold anoint the place till the violent heat be diminished. Others commend *Balsamus Saturni* made with Linseed-oil, and often anointed with a Feather. This is the Description of *Linimentum simplex*. Take of Juice of Night-shade fresh made, Oil of Roses, each 20 ounces. Boil them to the consumption of the Juice. Strain it, and add to it Litharge of Gold, Ceruss, each 1 pound. Mix them; make an ointment according to art.

IX. A Leech did a melancholick Woman a great deal of good, who had an eating *Erysipelas* in her Leg: for it drew out of the Veins thereabout the hot and adust blood, which had all along supplied the stubborn Ulcer with matter: which being sucked out, the rest of the trouble was easily over, only by applying Bread soaked in Water.

X. The famous *Veslingius* cured a certain person of an ulcerated *Erysipelas* in his Leg, when he had first purged the Body, by touching it sometimes with a Feather dipt in Spirit of Vitriol. He said, that these sharp chymical Liquours, were therefore applied to malignant and spreading Ulcers, that the corroding humours may after a manner be mitigated, and their violence broken, after the example of Salt of Tartar, and Spirit of Vitriol, both which were very sharp, and by their mutual acting one upon the other, their mixture produces a far more gentle Medicine.

XI. In the Blisters of an *Erysipelas*, which by force of sharp and hot ichorous Juices use to break out, *Fallopins* advises to prick them in the beginning, adding this moreover, that the place subject to the Fluxion should be prickt. Which operation also pleases me; yet I had rather doe it with a golden or silver Needle. But you must also know this, that they must not be prickt slightly, but also clipt with Scissers, that nothing of the Ichor may be left, which being kept in a Bladder might by its contact spoil the part.

XII. I knew a man about thirty five years old, of the Senatory order, whose Face was often invaded with bilious blood, and then was continually disfigured with an oedematous swelling, the thinner parts of the humour being dissolved. By the advice of Physicians several remedies were tried, altering Broths, Whey, Waters; but all in vain. I advised an Issue in the Arm, (it was made in the right Leg, but to no purpose,) which by the persuation of the Chirurgeon (whose Wife had found the benefit of it in the like case) he admitted. And he has not been troubled with this Disease ever since the year 1673. to 1679. his Face falling, and all signs of the Oedema being gone.

XIII. A Countrey fellow had an inflammatory *Erysipelas* in his left Hand, he anointed his Hand and Arm for some days with Oil of Roses; upon which his Pain, Inflammation, &c. grew worse, so that his Hand was all over gangrened: From whence it is clear, that Oil is a great enemy to Inflammations, as *Galen* 15. de simpl. intimates. ¶ In the year 1668. a Butcher's Wife of Geneva, called *Bourdillat*, anointed her Face, that had an *Erysipelas*

Sanctorius.

111

in it, with the same Oil, then she had a most filthy thick scab, as white as milk, which almost caused a Gangrene. Therefore *Fortis, Consult. 95. cent. 1.* bids us wholly abstain from oily and fat things; because being heated by the heat of the part, they may inflame it farther.

XIV. I happily cured an ulcerated Erysipelas by the method prescribed of *Rulandus, cent. 1. cur. 43.* One about sixty three years old was taken with an ulcerated Erysipelas in his feet, with great pain and swelling. 1. I thus purged the Body: Take of Syrup of Roses, *Mont. 1 ounce*, extract of Spurge half a drachm, Pectoral Decoction 1 ounce and an half. Mix them. A wash for the feet: Take of Roses 4 handfulls, Plantain 3 handfulls, let them boil a little in a sufficient quantity of water. When you take out your feet, and have wiped and dried them with a soft Towel, anoint them twice every day with the following Ointment. Take of Litharge 3 ounces, *Unguentum Populeon*, wash Cerufs, *Infrigidans Galeni*, each half an ounce, oil of Roses complete, 1 ounce. Let them all be mixt in a mortar, till it be made an Unguent. Water-Cresses is a singular thing in an Erysipelas.

Hartman.

XV. It is usual with some men to quench St. Anthony's fire with Frog spawn-water, but often with ill success: for it is too cold, because it has in it a Mercury joined with a certain saturnine property. Therefore indeed it is repelling; but a manifest cause of a Gangrene, and other grievous symptomes. And it is best to mix with a decoction of Myrrh and *Olibanum* in Wine and Vinegar.

Idem.

Medicines especially made use of by eminent Physicians.

1. This is a most certain remedy; Let a linen cloth be dipt in a Virgin's Menstruum, dry it, and when there is occasion, cut a piece of it off, and steep it in Vinegar of Roses, to draw out the Tincture, apply it warm, and repeat it several times. It presently draws out the heat. ¶ I have experienced this in several: Take of Rob of Elder 1 ounce, *Saccharum Saturni* 1 drachm; mix them well, spread it on a cloth, and apply it, in a few hours it draws out the heat. ¶ For an Erysipelas in the head Cinnabar of Antimony is very good, and nothing surer, it cures immediately. The dose is 15 or 16 grains in some proper liquor. Let it be given twice or thrice, it is an excellent Diaphoretick.

Joh. Agricola.

2. Butter of Saturn is sufficient to cure an Erysipelas, if it be applied cold outwardly. And it is thus made; Take some distilled Vinegar, in which let a piece of Litharge or red Lead boil 2 hours, stirring it with a stick. After the Vinegar is settled and clear, take a little of it, and shake it together with Oil of Violets, till it turn into the consistency of a very white butter, add often a little of the said Vinegar, impregnated with the Salt of the Litharge or red Lead, and some Oil of Violets, always shaking it, till you have a sufficient quantity. Keep it for use.

Pet. Joh. Faber.

3. Take as much scabious water as you please, dissolve a little Venice Soap in it, boil it a little. Dip a linen cloth in it, strain it out, and dry it gently upon a furnace, when it is dry, apply it, and repeat it several times.

Phil. Grulingius.

4. Some chymical Sudorificks are good for an Erysipelas. Some lixivial Scaps must be applied to the part affected, which imbibe the acidity, such as are linen cloths often wet in a lie of Beech ashes, shaken together with the white of an Egg and Camphire, and dried in the shade.

Frid. Hofmannus.

5. Wrap a Nutmeg in a wet Linen, or in Hemp, roast it in hot ashes; mix likewise with it as much Columbine Seed, wrapt in a wet cloth and roasted in the like manner. Make a powder. Drink it in small Wine or Scabious water, whereby the moveable turgent humour in the veins is more easily expelled.

Gr. Horstius.

6. There is almost nothing better for an Erysipelas, than that the Patient immediately take a few drops of Oil of Amber in some Elder-flower water, and sweat. It preserves a man also from this evil, if he use this Medicine once every month.

Conrad.

Kunrad.

7. There is scarce a more present Remedy than Pap, made of the bulb, leaves and flowers of the Daffodil, for driving away the inveterate pains of an Erysipelas.

Pet. Lau-

rembergius.

8. I infused some fresh Elder flowers in Whey, and when I had boiled them a convenient time, I strained it out, and drank a draught of it morning and evening for 3 or 4 days; and from that time to this I have been free from an Erysipelas.

Simon Pauli.

9. Linen cloths dipt in ones own Urine, strained out, and when they are dry, applied, draw out the heat, and cure the disease. ¶ Cow's dung, or Pigeon's dung, mixt with Oil and applied, is good.

J. Dav. Ru-

landus.

10. Sheep's dung boiled in Vinegar, and applied as a Cataplasm, is good, and when it itches, ones own water applied, kills it. ¶ Spirit of Wine is in this case highly commended, which does so difficult, that if the hurt part be presently chafed with it, it stops the swelling and inflammation, and also mitigates the pain by its narcotick virtue.

Exanthemata, or, Spots, Wheals or Pustules.

The Contents.

Sometimes we may purge and let blood. I.

When purging is proper? II.

Coming without a Fever cured by the help of diet only. III.

I. *Galien 2. in 6. Epid. 30.* considering Simon's history, who had broad Pustules appear, said that purging and bleeding were proper in this case: Not indeed to evacuate the matter transmitted to the Skin; but to take away the superfluity of humour residing in the venous kind, before the matter transmitted to the Skin, is evacuated by topical Medicines.

Sylvaticus.

II. It is no small difficulty to determine, whether in Diseases, wherein something breaks out in the Skin, we may use a purging Medicine, at the first breaking out, and in the beginning of the motion, or at any time else? Some being affrighted with the plenty of bad humours in malignant Fevers, do rashly run to purging, when spots begin to appear. For when they find that taking away blood is not sufficient, but that the accidents do yet increase, (and often because blood enough is not let, which would doe more good) they fall on purging, that they may be thought to oppose great Remedies to great Diseases: thinking they may avoid so urgent a danger, little regarding the retrocess of the deadly matter to the bowels, and expecting greater benefit from purging, that is, when the load of humours is taken away, which will not tarry for coction. These men are seduced by *Galien's* judgment, who denied not, that in the cure of Simon's Pustules we might use a Purge. That the truth may appear, we must know, there is a threefold difference of Efflorescences in the skin. For some are caused, while Nature by the malice of the humours is much irritated, and before the time; which being compelled, and taking care that the humours fall not on some principal part, changing her accustomed order, and before coction, drives the deadly humour from her self; Of this rank are the Small-pox, Measles, Erysipelas and Spots in malignant Fevers. Again, some are indeed made by Nature driving them out, but then the matter is more kindly, and such as causes

causes not a Fever inwardly: of which nature are pocky Pustules, and the scabby Eminences of *Simon* and all others, which break out at the Skin, while the faculty of the Veins unburthens it self. There are others also, that bud out at the skin, from some fault in the flesh or the third Region, through the depraved nourishment, as in the Leprosie, several sorts of Scab and Itch. From which difference it follows, that what is driven to the Skin, is either caused by the pernicious condition of the humour, which causes a deadly Fever; or by reason of abundance of ill humour, unfit for nourishment, whether it be in the veins or in the flesh. Also that which breaks through the Skin, is either fastened in the flesh and skin, and so causes Pustules and Tumours; or it onely defaces the skin with its colour and thinness, and raises a very diseased affection in the skin, while it prevents a greater in the bowels. Which things premised, it is resolved, that a purge must not be given in any defecation of the skin, as it begins, and in the very breaking of it out, whether the matter be malignant or not. And this should be observed especially in spots of malignant Fevers, Small-pox and Measles, nor yet after the complete time of apparition of the Small-pox and Measles. But sometimes upon the score of some most urgent danger, in Malignant-fevers (because while they are yet appearing, there is abundance of pernicious humour, and the Fever encreases,) after the violence of the eruption, and while the motion is continued outward by nature, sometimes it may be lawful to purge by friction and cupping; although this must be done but seldom, and with premeditation. But in other spots of the skin, which degenerate into the Small-pox and Measles, we must neither purge in the beginning, nor after the time of eruption is complete, nor at any time: because the humours, that caused the Fever, are they which degenerate into the Small-pox or Measles, and for that Reason the Fever presently ceases, which is discoloured, though there follow another from suppuration: In an *Erysipelas* very slowly, because in these Diseases the matter is very moveable. But if that which has appeared in the skin (whether *Erysipelas*, Measles, Small-pox, or Malignant-spots) do suddenly fall back, disappear, and turn inwards, we must purge forthwith, before it fall on any principal part, as the manner is in turgent humours. But in some

scabious eruptions, such as *Hippocrates* observed in *Simon*, and in others of the same stamp because they are settled in the flesh and skin, and come of a thick matter, and are moved slowly, you may give a Purge when you think fit; yet not in the beginning and very height of the eruption. For we must permit Nature to finish the motion she has begun, and afterwards we may purge at any time; because what remains within, as it breeds dayly more and more, so also it desires to be evacuated: for the matter is neither all together, nor expelled, but remains to be expelled, without any Inflammation or Fever, which can require coction, or it must be expelled because of urgency; yet by no means in the violence of its motion. For it is determined among the Prudent, to permit as yet the violence of the irritation and commotion in erring Nature, before we stop it, in evacuations which we must of necessity stop: Nor must we do it in those evacuations, which Nature moves from the principal parts to the ignoble, for the better, because of the deadly humour. In which matter the wiser, guided by reason and experience, fear to divert Nature from the work of expulsion, she has begun, by giving a Purge; which motion it were a thousand times safer to help by cupping, scarifying, &c. Because Nature would sink very much, and be wearied in the contest, by the violence which is done her by the Medicine drawing to the Bowels, contrary to her own motion outwards. Besides, upon its turning back we must fear it will settle on some principal part: for the turgescency is not more mortal, than the foresaid retrocess inwards and from the skin, contrary to the motion of Nature from within outwards. Nor also is it in the power of Medicine necessarily to force the humour, when it is moved, to the Guts.

II. A Nun, without any precedent Fever, or decay of strength, or any other usual signs appearing, was suddenly seized with Pustules all her body over, and she was then sensible of no other ail besides. She recovered onely by Diet without the help of Physick. I judged, because the Disease came in the wane of the Moon, that Nature helped by the monthly motion, rather drove the excrements, which were few, to the circumference; as if she had endeavoured insensible transpiration: Since the Pustules appeared not all red, as in others, but were somewhat black and greenish.

Rumiletus.

X A

A GUIDE TO The Practical Physician.

BOOK VI.

Of Diseases beginning with the Letter F.

Febris in genere, or, A Fever in general.

The Contents.

- The ordinary division comprehends not all sorts of Fevers. I.
There are Fevers of a doubtful nature. II.
In a Disease whereof it is a concomitant, Blood must not always
be let. III.
The cure by Alexippyreticks. IV.
A Fever raised by Art, for the cure of some Diseases. V.
Epidemick Fevers sometimes seize a man when there are no ill
humours in his body. VI.
They that are sick of a Fever must not always be kept in bed.
VII.
It is not requisite that every Fever should end in sweat. VIII,
IX.*

I. **I** Am of the opinion that old Writers knew not the kinds and differences of all Fevers. I will propound a fourth, found out by me, and hitherto observed by no man. And it is an uniform, continual Fever, without any exacerbation, following, immoderate heat of the Breast and Lungs, without putrefaction. And this heat seizes the Lungs for want of breathing in Air, through the fault of narrow Lungs: Which indeed being immoderately heated, cause a Fever for two reasons, in the Heart, and then in the whole Body. Both because they communicate the conceived heat immediately to the Heart, and because they so heat the inspired Air, how cold soever it be, that it is in no wise sufficient to cool the heart, according to Nature's appointment. Hence arises a continual Fever, which can neither be called properly an *Ephemera*, nor a *Putrid*, nor a *Hætick* Fever. If any one will refer it to

a *Hætick* Fever, improperly so called, as arising from a principal part disaffected, he will not be far out, so he understand the manner of its generation, not as yet observed at all by others. I have more than once observed, that they who were taken with this fever, laboured of an *Asthma*, not at intervals, but continually. ¶ *Sennertus* besides *Ephemera*'s, continual, primary or symptomatick, and intermittent, admits also of a certain kind, which proceeds from Worms, Milk corrupted upon Childrens Stomachs, concrete, extravasated blood putrefying, such as sometimes attends a *Dropsie*: And I add, such a Fever as arises from Phlegm swallowed down, and putrefying on the Stomach. Such Fevers proceed slowly, because while the matter is far distant from the Heart, they send slower and fewer fumes to it, and counterfeit *Hætick* Fevers. Höferus.

II. Some Fevers as well continual as intermittent, are observed in practice to be in a manner doubtful, which we can neither certainly refer to *Ephemera*'s, nor to any one kind of putrid Fevers: For some run out sometimes beyond the third day, and sometimes are in the same day often exasperated, and that either while the meat is digesting, or towards evening, gentle they are indeed, and such as that the Patient scarce thinks himself thereof; yet they are apparent by the celerity and frequency of Pulse, tiredomness, heaviness and wasting of Body, and sometimes by more grievous symptoms. And some of them being brought to a pure intermission, without any sense of shivering, gently, as I said, they do return, either while concoction is performing, or towards evening, or on any occasion: Some of this sort are caused by a violent Itch, Scab, Felons, by outward Boils, and sharp Distillations: Some also are caused by invincible crudity, or bile effervescent without putrefaction, or some half disordered quality of the humours, which possesses the first or any other Region of the Body: For this
their

their vitious quality is the middle way to putrefaction, at which the Disease for the most part stops. Wherefore I remove all this sort of Fevers either by a thin and cooling Diet, under which Nature alone might amend the fault in the quality, Or, if Diet did little good, I moreover accommodated bleeding or purging to it, which were quickly attended by a recovery.

Fernelius.

III. Our modern Physicians proceed to let blood in any Disease, so there be but a Fever, contrary to the mind of Hippocrates, who so much feared bleeding because of a Fever, that for its sake he often thought fit to abstain from letting of blood. So Sect. 3. Coac. 79. Letting of blood is bad for pains lying about the side, in Fevers. And 2 Epid. Sect. 2. v. 10. If there be an Ulcer, bleed in the inner veins, so he be not in a Fever. And a little after. v. 18. Whoever are taken speechless on a sudden, if they have not a Fever, let them bleed. Coac. Sect. 2. v. 72. Whoever are taken on a sudden with a pain about the Hypochondria and the Heart, &c. Bleeding cures them. The reason depends on this, because a Fever does not only argue there is choler, seeing Hippocrates, l. de Nat. Hum. v. 272. thought that all Fevers, Diaries excepted, have their rise from choler; but it shews that the choler is in a ferment. Wherefore in this case bleeding does much harm; both on the account of the sign, because it shews bile is predominant; and in a ferment; and upon account of the cause, in as much as the humours, made thin by Blood-letting, are so far attenuated by the febrile heat, that the whole blood almost is turned into bilious juice: for Bile is nothing else but attenuated Blood immoderately boiled or inflamed by heat. And this is the reason, why they who have bled immoderately, are subject to cholerick Fevers; as Hippocrates observes l. 2. de Morb. Mulier. All which things the prudent old Man taking notice of, did so far suspect Blood-letting in putrid Fevers (these he calls Fevers from Bile) that for the cure of them he nowhere admits it. Which Doctrine of Hippocrates Galen understood otherwise, when he settled this Axiom, That it is most wholesome to let blood in every putrid Fever; whom the Moderns follow, who let blood in every Disease, as often as there is a Fever, as though it were the principal Indicant of Blood-letting.

Martianus.

IV. The cause of the febrile ferment, which is elevated from divers Subjects, breeds the distinction of Fevers. For in intermittents the occasional cause resides in the first ways, that is, in the Stomach, Guts, and other adjacent parts. The cause of burning Fevers properly so called, is contained in the mass of Blood it self, which is either corrupted from without, and made malignant and poisonous, or it raises an intestine War. The subject of infection or the mine of Continual periodick Fevers, is either in the Mesentery, Pancreas, or in some other Organs designed for elaboration and defecation of the blood. And in removing all these, our chief care must be directed to that which is most urgent, namely, to appease and hinder the ebullition of the blood, which causes the fever fit. A thing nevertheless, which will immediately be performed, neither by bleeding nor purging, that is by diminution of strength, but by specific Febrifuges, Preparers of the febrile matter, Diaphoreticks and Diureticks.

Frid. Hoffmannus.

V. If a Fever come upon a Lethargy, the Lethargy is cured. But if a Fever come not of it self we may cause it by Art, by anointing the Pulses with Oil made of Beetles, called *Lucanici*, as you make the Oil of Scorpions. For so upon certain experience, a Fever is raised, resembling an *Ephemera*, which disappears presently the next day.

Hæcærus.

VI. Seeing the specific differences of Epidemick Diseases, namely of Fevers, rely upon the secret constitution of the Years, they labour in vain, whoever would draw the reasons of the difference of Fevers from a morbidick cause gathered in Man's Bo-

dy; for it is as clear as can be, that any man, be he never so well in health, if he go to some certain places where a Fever rages, shall be taken sick in a few days. And it is scarce credible, that any manifest alteration can be made by the Air, in so short a time, upon the humours in the aforesaid man. Nor is it less difficult to accommodate general rules for conquering these Fevers, and we may not fix any certain bounds, how far to go and no farther, and where to fix. Therefore in so obscure an affair, I think nothing better, when new Fevers are first abroad, than to pause a little, and to proceed, to the great Remedies especially, with a suspense pace and slowly: In the mean time diligently to observe their nature and way, and with what sort of Remedies the sick are benefited or hurt, that as soon as may be we put away these, and use them.

Sydenham.

VII. Manifold experience ascertains me, that it uses to fare very well with the sick, in all Fevers, that is, which participate of high inflammation, if they be not always imprisoned in their bed, but keep up every day, at least some hours; or if their weakness forbid that, let them put on their clothes, and lie upon the bed, with their Head high. But how much good soever it doe the sick, we must nevertheless take notice, that if they keep longer up from their bed than they should, at one time, they may especially in the declension of the Disease, easily fall into running pains, which may end in a Rheumatism: And sometimes also they may be overrun with the Jaundice. Which things if they happen to any man, he must be confined to his Bed, that the pores of his Skin being open, such particles may commodiously be evaporated, which give fewel to either Evil: But this must be only for a day or two, and not so as to sweat. But such Accidents are very rare, nor do they ever appear except in the declension of a Fever, at which time, when the Disease is now grown milder, you may with much more safety suffer him to keep his bed always, than either in the beginning, or in the State; yea, at this time it will conduce much to digest the febrile matter, which if the sick should be laid up in his bed sooner, would be more enraged and inflamed. For it is certain, the heat is increased by what is circumambient, and it must of necessity so be, if the sick keep himself continually in bed.

VIII. If any one do here object, that such a Method is not so expedient, in that it hinders evacuation by sweat, whereby the febrile matter then concocted, should wholly be thrown off. I answer, that he, who is of the contrary opinion, says nothing, unless he can first make it out by arguments, that this sort of evacuation is due to every Fever, which is not so easie to doe. For Experience, and not Reason, shews what sort of Fever should be cast out by Sweat, what by Purge, &c. Nay, we have reason to believe, that there are some sort of Fevers, which Nature throws off in a method peculiar to it self, without any visible evacuation, that is, by reducing the morbidick matter into the mass of blood, and by assimilating that to the blood which before was not so agreeable to it. Which reason I relying upon, have often in this sort of Fevers, as well as others, presently upon the first coming, and while all the Blood was not as yet infected, reduced the same into order, only by ordering Milk and Water for drink, and forbidding the eating of Flesh, or broth made of the same, allowing them in the mean time the use of their constant exercise, and the open Air, without making, so much as once, any evacuation at all.

IX. But if we grant, that Nature cannot conquer the Disease by any other method, than by sweat, must we not understand such sweats, as break out, when the Disease grows weak, and as flow from previous digestion, and not such, as being cast off in the first days of the Disease, proceed from the interrupted Oeconomy of Nature in a rage? Such

sweats, I think, are not to be promoted, but the tumult rather should be appeased, to which they owe their Original; and such sweats usually attend many sorts of Fevers, though not all. For neither am I ignorant, that some sorts of Fevers are of that nature, that in their declension they require this critical sweat. Such are the particular Paroxysms in intermittent Fevers; and also the great and most frequent Fever in Nature, depending upon that constitution, which especially conduces towards the production of Agues Epidemically. For in these, if any method be insisted on, which does not tend to this purpose, that the morbidick matter may first be digested, and then cast out by sweat, the Disease will be increased. Wherefore here no evacuations ought to have place, unless as they may be able to stop the violence of the Disease in the first days, when it seizes a man, lest the Patient sink under the Physicians care. Besides, the cause of a Pestilential Fever, since it is very thin and subtle, it may be carried off by sweat in the beginning of the Disease, experience every where concurring. But in these Fevers, in which by the ordinary duct of the symptoms, although they be left to their own secretion, we no where observe Nature usually to evacuate the morbidick matter already prepared in the determinate time, I know not whether he be not over rash, who thinks to doe any good on the Disease by provoking sweat, and restore the sick by that method alone, seeing as the old man teaches, *Where Nature is repugnant, all things are in vain.* And I think this usually happens in this particular Fever, whereof we treat, which, I am taught by manifold experience, may to my knowledge be driven away without sweat. And I know also, the Patient is brought into manifest danger of his Life oftentimes, while we without any urgent necessity importunately sollicit sweat, by the morbidick matter being carried up into the Head. Yet neither in this Fever, nor in any other, even of those which use not to end in a critical sweat, if by chance such a sweat come of it self, when the Disease is now diminished, which from the remission of all Symptoms, we reckon the effect of due concoction, will the most prudent Physician condemn it. But when it comes not out of it self, how can we certainly know, whether we kill not a man, when by regiment and hot cordials we endeavour to dispose the humours to such sweats? But however the case be here, I am abundantly satisfied, the Fever onely brings heat enough with it, which may suffice to prepare the febrile humour for coction, and that a more intense one than that need not be caused from without by a hot regiment.

Sydenham.

Febris putrida in genere, or, A putrid Fever in general.

The Contents.

We must consider the different seasons of the year, rather than the various constitutions of the Sick; where the nature of Autumnal Fevers is treated on. I.

We must have respect to the differences of one Year from another. II.

We must distinguish between the Infection and the Matter. III.

THe diversity in the cure of Fevers that arises from the different seasons of the same year, and also from the difference of one year from another deserves no less consideration, than what arises from the different temperaments of the sick. And truly among the principal reasons, why the cure of Fevers is so uncertain, and the endeavours even of learned men

succeed so ill, I think this should be reckoned for one; that Practitioners use to accommodate their observations, which they have made from the successful cure of one or more Fevers in this or that season of the year, to the cure of all Fevers, in any season, or any year; a thing which I look on altogether as dangerous, as if a Physician should not have respect to the different tempers of the sick peculiar to each, but should give the same Medicine promiscuously to all in the same Disease. First, that I may discourse of the varying methods of cure, which are accommodated to Fevers in the different seasons of the year, it must be considered, although other differences may be granted among Fevers upon other accounts, yet that they principally differ according to the subject matter, in which the febrile commotion is made; and that that matter has its difference according to the different disposition of the blood, as it is produced by this or that season of the year: for the febrile commotion, which happens in the Spring time, arises in the blood, when all the Spirits are brisk; but the Autumnal one, in the blood depauperated by the heat of the foregoing Summer, and by the virtue and effects of it. And as a Fever happens to invade the blood in reference to the nearness or distance of these two seasons, so the Disease participates more or less of the nature of the fermentation that belongs to this or that season. And what we observe in our practice, is agreeable to these things, namely, that all things else corresponding, Autumnal Fevers are more dangerous than others, and are accompanied with more dangerous symptoms, than Vernal ones, because the Spirits of the blood are more evaporated and spent in the Autumnal season, than in the Vernal; which is one reason, why evacuations, especially of blood (which is not onely the Vehicle of the Spirits, but the Storehouse) are so hurtfull in Autumn, though they life to doe good in the Spring. And may be from this degenerateness, which frequently happens to the blood in Autumnal Fevers, from the forementioned poverty of Spirits especially, a poisonous quality is often bred in the blood, which produces not onely the ill natured symptoms accompanying the Fever, but sometimes even the Fever it self: for Nature violently irritated by it, rises against it, nor does it begin this new Ebullition for any other end, than to cast out the said Malignity; wherefore it lies upon the Physician rather to resist this by help of Alexipharmacks, than to resist the Fever by evacuations and cooling medicines, which Nature seems to have set in Battel array, to conquer the Malignancy. We have a remarkable Instance to this purpose in the Plague, which if destitute of a Fever, is much more dangerous, than if it have one accompanying it; and truly every malignity, which seizes the blood, if it cannot of it self raise an Ebullition, or if it can, be hindered in doing it, does of necessity render the Disease either mortal or of long continuance; mortal indeed, when in its essence being contrary to Nature, it corrupts and destroys humane temper by an hidden property; and of long continuance, when, although of its own Nature and occult way of working, it be apt greatly to hurt the body, and by degrees to waste it, yet it has not the power to kill suddenly. In the mean time that some malignity, which otherwise by its pravity necessarily causes death, is sometimes safe, where there is an Ebullition of the Blood to cast it out, the Plague it self does sometimes testify. And where no such Ebullition is, to cast it out universally and every way, there for that reason the Disease is long, as appears in the Scurvey, Pox, &c. To return to the business, I have observed, that in all sorts of People sick of Autumnal Fevers, blood must be let but sparingly, and in Persons not grown, or past the flower of their age, not at all. It is dangerous to give cooling Medicines, unless the Fever be

be over high, and the Party young. Vomiting is very necessary, where there is a propensity to vomit. But in Vernal-fevers blood may be moderately let in all persons, and in People in their prime, plentifully. Clysters and cooling Medicines doe a great deal of good, when the Patient is young, and when the Fever is not declining, nor large bleeding preceded. Vomiting, where there is a propensity, is not absolutely necessary, but yet proper enough; nor does the omission of a Vomit plainly cause a looseness in the declension of a Fever. I never yet observed a hard Belly or swollen Feet follow Vernal-fevers; but both are very frequent after Autumnal ones, especially when blood has been let plentifully, if either the Patient were in his childhood, or had passed his prime.

Sydenham.

II. Secondly, that we may speak moreover of the difference that arises among Fevers, from the difference of some years from others, and farther, of the cure that belongs to them on that account; we must take notice, that the reason of this difference between the Fevers of one year and another, cannot be given always from manifest causes, since it often falls out, that one year is Epidemical as to Fever (not the Plague onely) not less, but in the ordinary malignity, where we cannot assign any reason from badness of food, nor from inferiour exhalations putrefying in the Air, nor from the inordinate and unequal alterations of the times and seasons, inclining to heat and moisture; but we are forced to confess this constitution is the product of a malignant and inexplicable destructiveness of the Air. Nor is it less difficult in this case to find any certain and determined way of cure, which may exactly answer to the difference of Fevers, depending on the various temper of the years. Nevertheless I shall not stick briefly to declare what things have offered themselves to our diligent observation. In Autumnal Fevers therefore, which in an Epidemick constitution, and in a year, wherein Diseases peculiar to Autumn (that is, Quartanes, and malignant Tertians) do appear sooner than ordinary, suppose in June, or beginning of July, Bleeding is very hazardous. And what I intimated of Autumn (concerning which I was now speaking) Experience testified it to be true; for for the most part of that season, it was found mortal, especially in the beginning of Autumn, unless the Patients were in their prime, and were able in some measure to bear the loss of blood, in which case indeed, although it caused not death; yet they found the Disease long and very dangerous, and attended with most cruel symptoms. Certainly, as I remember, the like danger did not offer it self from other evacuations, and especially from those that were made by Vomit, which for the most part, both in that and other, the like malignant constitutions, had an issue good enough. But now ever these things be, I have long since learned, that the Physician must give his advice, as the present occasion shall require, that is, he must accommodate the scene, variegated with so many differences, as much as may be conveniently, by changing his practice now and then, or, altering it a little, according to the temper of the season, and the Patients. In the mean time I can affirm this, that the general method already laid down (as far as I could hitherto gather from attentive observation) does in it self well enough comprehend the cure of all Fevers, although I am not ignorant, that now and then the different seasons of the year, or the difference of the years themselves, do hinder, that we cannot fix any certain limits, whither we may go, and no farther. It is better certainly, when Fevers begin to rage, diligently to observe their violence and way, and by what sort of remedies the sick are helped or hurt, that rejecting these, we may use the former. And if that be done, I think in very deed, when we have made some trial of it, that it will be found, the way of cure hitherto described, does

not much miss the mark: Certainly, as for my self, I think very seldom to deviate from it, even in malignant Cases, for which it is very proper, because it keeps up due fermentation, (Nature's best Instrument,) by whose help it expells and throws off all the poisonous matter lurking in the blood.

III. We must of necessity distinguish between the Infection and the Matter. Take away the Infection and the corrupting superfluity, and the matter of it self will not breed a Fever. Common practice justifies this Doctrine: for how many come every day to us to be cured, who have not onely gathered a Cacochymy in the Veins that arise from the *Cava*, but in the Mesaraicks, and first ways also, and are troubled with a great hardness in one or both the Hypochondria, without any great Fever? There is no man but will acknowledge that here the matter is large, but the febrile Infection is onely wanting. After long Fevers, it is a very common thing for Cachexies and Dropsies to follow, when the Fever is extinguished. Therefore I do not distinguish without Reason between the Matter and the Infection; the Infection must be expelled by sweat, the Matter must be taken away by purging and bleeding, and obstructions, if there be any, in the Bowels must be opened. As to the giving of Purges in the beginning, this is my opinion, that the putrid and febrile Infection does not give way so well to a Purge, as to a Sweat, and (if I may so call it) a Magnetick Epitheme: And the humours are too much stirred and disturbed by Purgatives, especially if they be violent; from both which these mischiefs follow: By a Purge, the febrile Infection being left, putrefaction spreads the farther, and upon it the Fever it self is increased and prolonged: And by a Sweat the Infection is more deeply imprinted on the humours, and the thinner part being withdrawn, (for this is fittest for expulsion) the thicker are more closely impacted to the vessels, and obstructions are increased, and the Fever abates never the sooner; nay, the Bowels being thereby spoiled, and now and then new humours gathered together, mischief is often heaped upon mischief. Experience is witness, which has long since shewn, that Quartan Agues are oftner exasperated than cured by too much and violent purging. Therefore all diligence should primarily be intended to the subtracting of the Infection: And it may the more easily be subtracted, the sooner a man begins with it, before it have yet got any considerable strength, before it be thoroughly mixt with the humours, and have deeply infected them, or seized upon some of the inwards. Since therefore, as appears from what is said, that Infection may best of all be thrown out by a Sudorifick given inwardly, or an Epitheme applied outwardly; such things certainly may by no means be rejected, but, as soon as possible, be made use of.

Pullets Livers roasted must not be given in Continual Fevers. XLII.

I. *Avicenna* forbids Blood letting in a Burning-fever, and a Continual Tertian, unless the Urine be thick and red: fearing lest the Bile ferment the more, whose bridle, he says, the Blood is. But this opinion is exploded by the wiser sort, because Nature her self often judges such Fevers by bleeding, and sometimes they produce Phrenzies and other inflammations. Finally, because letting Blood cools powerfully, it rather stops the Ebullition than causes it, for not onely Blood, but Bile also mixt with it is taken away; so that in the mass, which remains in the Veins, there remains the same proportion of Blood to Bile, that was in them before; yea, when the Vein is opened, if the Patient's strength be good, and the Blood burst fast out, onely the putrid, and what is troublesome to Nature, is discharged, the purer remaining in the Veins, which is taken notice of by few Authours, although it be commonly observed in practice. For if the Blood come out of the Vein drop by drop, it is the purest, which comes out in its proper motion: But if it burst out violently, the impure and putrid appears, Nature forcing out the worst part of the mass of Blood. Yet Blood must be let more sparingly, in very choleric natures, in the heat of Summer, and about the Dog-days, than in other Natures and Constitutions. ¶ We must not trust the sign from the Urine proposed by *Avicenna*: for sometimes in a Burning-fever, the Urine has no signs of blood mixt with it, where a Phrenzie is either present or imminent, and yet then it is most necessary to let Blood.

Riverius.

Primeroseus.

II. If it be needfull to let Blood for evacuation, it must be done the same day: If for revulsion, on several. For when we evacuate, especially in Acute Diseases, the Body must be suddenly changed into another state: Then it often happens, that the Disease presently runs through its beginning, so that afterwards we may not so conveniently use Blood-letting. But in Revulsion we have respect to the motion of the humour, which is better done, if at divers times, and some interval allowed, Nature as it were accustoms her self to a contrary motion: for in the interval of time the Blood poured into the parts regurgitates into the Veins, and is usefully drawn out by letting Blood repeated. I apprehend Blood-letting should be repeated, if the Blood that was first taken away be very foul, and plenty of it seem to remain in the Veins. Yea, and though the Blood appear pure, and not at all corrupt at first; yet we must not stop it, but rather continue it till it appear corrupt. And here *Hippocrates* his Rule, *l. de viis. Acut.* concerning the cure of a Pleurisie, has place, namely, that taking away blood must be continued to the change of colour: So that if corrupt Blood come at first, evacuation must be continued till it appear more pure: and on the contrary, if laudable Blood come at first, it must be so long drawn out till the impure and corrupt come. Yet in each case some difference must be used, for if laudable Blood come first, repetition must be made in the same Vein, that the putrid Blood residing deep in the Body, may sooner be drawn out: But if putrid Blood come at the first, Blood must be taken from the other Arm, and consequently either Arm must be bled alternately.

III. Some after Autumnal-agues fall into continual fevers, for want of purging in the end of the former Disease: If you let them Blood, there is great danger lest the sediment, which the foregoing fermentation had let fall, should be drawn back into the mass of Blood, and raise new trouble. Then instead of Blood-letting I use Clysters till the twelfth day, if the Patient be young, and the fermentation over high.

IV. They that undertake the cure of an Acute fever, do at first either bleed immediately, and purge the next day: Or, they first give a Purge, and after let Blood. But they doe injury to *Hippocrates*, *Galen*, and others, with whom it is frequent to cure Diseases quietly, with onely one of these Remedies. So *Hippocrates* 2. *acut.* in a Pleurisie ascending, onely lets Blood, in one descending, he onely gives a Purge. And *lib. 4.* In the first Burning fever he breaths not a Vein, but is content either with a Vomit, or Clyster, or a gentle Purge: In another he bleeds, if the Disease be high, and the strength good. *Galen in Method.* cures Continent and Continual fevers onely by bleeding, nor does he use a Purge, unless a great *Cacochymy* be joined with it. Which Learned Posterity hath carefully observed. Yea, it often happens, that a Purge, which would be otherwise necessary, is omitted after bleeding, because of the wasting of strength, which we fear both from bleeding, and the future agitation of the Physick; and instead thereof a Clyster may be given every other day, according to the advice of *Hippocrates* and *Galen*. Sometimes, for fear of strength, we do not bleed, but onely purge, although in respect of the Disease bleeding were proper. Therefore purging must not always be joined with bleeding, as if one were useless or ineffectual without the other. Fasting has been sufficient for many; Bleeding for others; Purging alone not for a few; onely Clysters for others: All which used jointly would waste a Man's strength.

V. I saw a Woman of a full and fat body, who falling into a Burning fever, took the advice of a certain unskillfull Physician, who let her Blood plentifully; immediately upon which she grew grievous ill, and was in a far worse condition; for as Blood

Aug. Fer rñ.

us.

Vallius.

7. Epul.

abounds in thin bodies; so flesh abounds in the full. Therefore when I was called to the Woman, and found her in extreme danger, I thought all observations should be made use of; that is, those to which the care of him that cures ought to be directed. Wherefore I recruit her strength by all sort of means, which was long before waited, till, when her strength was returned, I thought fit to carry off the matter by a Purge, which I knew abounded in her. Which when I had given my Patient of cold things, the Fever was presently extinguished, and the Woman, whose Funeral was providing, being rightly cured, recovered.

VI. To let Blood in the very height of an acute Fever, *Celsus* said, is to kill the Patient; but it is a particular Counsel, not an universal Precept. In the very height of a Fever, when Permittents are present, and there is danger of the Brain, as to watching, pain, or a delirium; sometimes it is not unnecessary to take away Blood; for the fanning and cooling of the Blood, as it often passes to and fro, through the perspirable Veins. Burning fevers raging with implacable fury, and threatening heavier things, are then lawless, and admit it even in the State. The danger from unbridled plenitude surpasses that which attends unseasonable evacuation.

VII. We must remember, that in Continual Fevers, where there is suspicion of obstruction of the pores, whatever things open and incide, are improper before Evacuation of the whole.

VIII. It is much controverted among Authours, whether Purges may be given in the beginning of Continual Putrid fevers? Which difference, setting aside the turnings and windings of Disputations, may be thus composed; Upon the account of the matter, that immediately produces a Continual Putrid fever, which is contained in the greater Veins; Purging is not convenient in the beginning, unless it be turgent, that is, unless it be so stirred by Nature, who is irritated by its ill quality, and endeavours to expell it, that it be thereby much disposed for excretion. Which, notwithstanding, because it seldom happens, its concoction, for the most part, must be expected, before evacuation of it by Purging Medicines be undertaken. But upon account of the matter contained in the first region, if there be much of it, which may increase the Fever, burthen Nature, and divert her from the concoction of the matter in the Veins, a Purge may be given within a day or two after Bleeding, but it must be gentle, and such as onely evacuates the first region. And we know bad and excrementitious humours abound in the first region, that is, in the Stomach, Guts, Mesentery, or about the Heart, by Thirst, pain of the Stomach, or of some other part contained in the lower Belly, Looseness, and other Symptoms, upon account whereof Purging sometimes must be premised to Bleeding.

IX. Vulgar Physicians, imitating *Hippocrates*, who Purged *Cydes* his Son, on the sixth day, Purge all their Patients, that are sick of Continual Fevers, on the sixth day, that a great part of the noxious humour may be withdrawn, before the battel, which the seventh day produces, come on. But this must not be done without caution, nor rashly, for it is material, what the constitution of the disease is. For the seventh day is not critical in all acute diseases, but in some the eleventh, in some the fourteenth, and in others the seven and twentieth. We must know whether the matter be turgent, whether there be a great quantity, whether there be any concoction, and whether the fluxions of the beginning are ceased, or not. All these things considered, we must either Purge or not Purge, according to the common rules; not onely on the sixth day, but on the fifth, fourth, third, or even the first, if the case will allow it. ¶ *Andreas* being sick of a Fever, took *Mercury* to Purge him

on the sixth day, and it wrought well indeed, yet he was no better, but rather worse on the seventh. An excellent example indeed; what harm a Purge unseasonably given, before concoction of the matter, does; namely, it increases Fevers, and of simple ones, makes double; of intermittent, continual; although the Purge seem to have wrought well to those that are by: Nay, sometimes a Man is hurt so much the more, by how much more freely he Purges, by reason such Stools are caused by colliquation. And I have seen many, presently upon unseasonable Purging, fall into a Consumption: So much ought the common practice of them be avoided, who Purge in all Fevers on the sixth day, when notwithstanding it can be given properly but to a few on that day: Because in most sick persons the beginning is over on the sixth day, or near it, and the time of concoction not yet come. And we Purge about this time but seldom, yet sometimes for necessity's sake we doe it.

X. In the second sort of Burning fever, caused by salt Phlegm raging in the greater Veins, *Hippocrates* 4. de vict. Acut. orders Attractive Broths to be given; that is, to mix loosning Medicines with broth. Wherefore, as in the first (which a bilious Ichor running through the Venous-kind, and especially through the outer small Veins, does breed) he tried to Purge first by a Clyster, and then by Affes Milk, because the matter being thin, and ready for motion, it might easily be carried off by any gentle Medicine; So in this, wherein the peccant humour is salt Phlegm, and far thicker, Purging could not be administered by the same Medicines; wherefore it was necessary to give a Medicine, that by its Purgative faculty might draw off the humours: but lest it should doe hurt by its strength and violence, he orders it to be given in broth. For by this means the saltness of the peccant humour is taken off by the broth, and the driness caused by the Fever is corrected; and that which a Purge usually causes is much hindered, and the Body is at the same time also refreshed. And the noxious humour is partly carried off by virtue of the Medicine that is given, by which evacuation Nature being relieved, can more easily judge the disease. And he would have these broths to be given, as often as the Belly is not loose of it self, by no means when it is loose; for then the solution of the disease is expected from Nature rather than Art.

XI. In a spurious Burning Fever, when manifest signs of coction appear, to wit, when the Fever declines, some gentle Purge may be given, more boldly than in a legitimate one. And I should think that in this especially *Hippocrates* propounded his attractive Broths; so that we should mix Broth with attractive Physick, or give it presently after the Physick, to avoid too much heat and drought.

XII. Some reject Rheubarb, because it heats: And Manna and Syrup of Roses, because they being sweet may easily turn to choler. But if Rheubarb be infused in cooling Waters or Decoctions, or Manna and the other dissolved, they can cause no inconvenience, especially if Tamarinds, which are highly commended for this purpose, be added to the said decoctions, or the Pulp of them be given also.

XIII. If any one inquire at what time of the Fever I would have a Vomit given, I say plainly I would give a Vomit in the beginning of the Fever, if I might have my wish; for so we might fore-arm the Patient from those horrible Symptoms, which derive their original from the filthy humours lodged in the Stomach and parts thereabout: Yea, and perhaps we may crush the disease in the very shell, which would otherwise increase, and grow long-lived, to the hazard of the Patient: for it is nourished by these said humours, which being in their substance transmitted to the inner parts of the body, are mixt with the mass of blood, or being worse

Fortis.

Riverius.

worse by their tarrying there, and infected with a poisonous pravity, and passing continually from their focus, they breathe a malignant vapour on the blood. The disease Cholera gives us an instance of this, for it sometime happens, that they who endeavour to stop the Vomiting unseasonably in that disease (whether it be done by *Laudanum*, or by astringent Medicines) bring on a troop of evils, no less dangerous, when it is stoppt. For the sharp and corrupt humours, whose exclusion should have been so long let alone, as till they had been sufficiently evacuated, being by this means repelled, exercise their violence and cruelty on the blood, and kindle a Fever, which, as it usually is ill-disposed, and accompanied with grievous Symptoms, so it can scarce be cured, but by giving a Vomit, though the Patient have then no inclination to it. But if, as it often happens, I be called too late, and so cannot provide for my Patients health, by giving a Vomit in the beginning of the Fever; yet certainly I think it is convenient to doe it at any time of the disease, if the disease have not spent the Patient so far, that he have not strength to bear the violence of a Vomit. Indeed I have not scrupled to order a Vomit the twelfth day of the Fever, even when the Patient had lost his inclination to it, and not without success: for I stoppt a Loosness, which hindred the blood in finishing its despumation; and I should not scruple at all to give one later, were it not that weakness forbids it.

Sydenham
de Febr.

XIV. After the Patient is let blood, I inquire carefully whether he Vomited, or was troubled with any inclination to Vomit, when his Fever took him. If any such thing had happened, I ever prescribe an Emetick, except tender Age, or great weakness hinder. Certainly it is so necessary to give it, when such a propensity to Vomit has gone before, that unless that humour be discharged, it will become a sink of many difficult evils, which will create trouble to the Physician, through the whole course of his cure, whence there is no small danger. The principal and most usual of these is a Loosness, which follows in the deservescency of a Fever, as often as a Vomit, when it was necessary, was omitted. For in the progress of the Fever, when Nature has something conquered the malignant humour in the Stomach, and sent it to the Guts, they are so corroded by the sharp humour, and by this fountain, that is always running, that a Loosness cannot chuse but follow; therefore dangerous, because the Patient, who is already weakened with the disease, is made weaker still; and besides, in the declination of a Fever, at what time the blood ought to contract itself, and exert its strength to perform its office of despumation, it is wholly hindred by this evacuation. And I have often observed, that when a Loosness is once come, astringent Medicines doe little or no good, whether used inwardly or outwardly. Nevertheless, I have observed, in Fevers which are abroad in the beginning of Spring, that omission of a Vomit, although a propensity to it have gone before, does not of necessity cause a Loosness, which yet at any other time of the year it causes; therefore then I think the use of one not so necessary, though useful.

Idem.

XV. In the evening after a Vomit has been given, I always make it my business to appease the tumult raised in the humours by the Emetick, and to cause rest; and therefore I order some Paregorick Draught at night about the hour of Sleep. *E. g.* Take of Red Popy-water 2 ounces, *Aqua mirabilis* and *Syrupus de Meconio*, each 3 drachms, Syrup of Red Popy half an ounce. Mix them, make a draught.

Idem.

XVI. This is to be observed, if the condition of the Patient require both Bleeding and a Vomit, you must Bleed before you give a Vomit; for otherwise, while the Vessels are distended with

Blood, there is danger lest by violent straining to Vomit, either some Vessel be broke in the Lungs, or the Brain be hurt by violent forcing of the blood, and so the Patient be taken with an Apoplexy and dye. *Idem.*

XVII. We must consider also, whether, notwithstanding the foregoing evacuations, the blood be not even still in such a heat, that bounds should be yet set to its effervescence. In which case, that the dangers thence imminent may be avoided, the next day after the Vomit I prescribe a Clyster, and order it to be repeated as there shall be occasion; whereby it often comes to pass, that the blood having received vent, its heat is sufficiently bridled. Unless we be forced to repeat Blood-letting once and again, by reason of a very sanguine temper, flower of ones age, or an inflammatory disposition brought upon the blood by drinking too much Wine: But abate the foresaid cases, and we may well enough repress the heat by help of Clysters. Wherefore, if the blood be over-hot, I order a Clyster to be given every other day, and to the eleventh day, or thereabout. Yet if great store of blood have been let, or the Patient be old, then I prescribe none, although the blood ferment very much: For it is certain, that by use of them, the strength of the blood is diminished, and the tone of it (if I may so say) made lax, inasmuch indeed, that the work of Nature, in old Men especially, is interrupted and hindred. *Idem.*

XVIII. Concerning Clysters, it is to be observed, that in the beginning, and through the whole course of the disease, one must be given every, or every other day, if the Belly be not loose enough, of a decoction of emollients and coolers; yet in a more violent Fever it is better not to add Oils, because they are easily inflamed. 2. As to Coolers, in a decoction for one, only two or three Pills of Houseleek must be prescribed, because it cools most powerfully, and used in a greater quantity, it might spoil the Guts. 3. In all Choleric Fevers Clysters should be given not actually hot, but only a little warm. *Riverius.*

XIX. As for Cordials, because it is found by experience, that if they be given too soon, they doe considerable hurt, therefore it is always my care not to give them in the beginning, unless the Patient be weak with former evacuations, or stricken in years; But upon the twelfth day of the disease, when the business is toward secretion, I think we may freely indulge them hot Medicines, if we do not fear that the febrile matter may be driven to the principal parts: For at this time, the more I heat, the sooner I hasten concoction. Nor can I apprehend what Physicians do mean, when they so often inculcate their rules, about giving Medicines to promote Concoction; and at the very same time prescribe Medicines, which may temper the Fever. Indeed the Fever it self is Nature's Instrument, whereby she separates the impure parts from the pure, which is not so manifest in the beginning of the Disease; something more apparent at the height, most apparent in the declension; which the Urine does shew. The concoction of the febrile matter signifies nothing else, than the separation of the peccant matter from the sound; therefore, that you may accelerate this, we must not be taken up with I know not what Attemperants, but the effervescence of the Fever must be permitted so far, as the safety of the Patient will permit. But when it is toward an end, and in the Declension, the Secretion being then conspicuous, then we must follow it with hotter things, to accomplish the business sooner and surer. And this is in truth, to promote concoction of the matter, whereas evacuation and cooling prolong and hinder the cure, as I have often observed. If Fermentation proceed aright, despumation will be finished about the fourteenth day; But if you use any coolers later than that, and

Sydenham.

and so by their means the effervescence be stoppt, no wonder if the Fever run out one and twenty days, or longer.

Mercatus.

XX. The Physician must not use astringents in a legitimate Burning fever, nor very cold things, seeing for the most part it ends in Bleeding, or Sweating: Both which ends such things do oppose, and much less may we use them in such as are not legitimate, seeing the humour in this Fever is difficult of concoction; for thick and glutinous phlegm is bred of cold things, which is the reason that this Fever usually ends in an Abscess, as *Galen 4 de rat. v. saith*.

Riverius.

H. ab Heers
Obs. 22.

Idem. obs. 5.

XXI. We must observe, that Syrup of Violets, and other sweet Syrups, must not be given alone, both because they make the Stomach lax, and also because before they penetrate into the veins, they are converted into a hot vapour by the heat of the Stomach, which afterwards increases thirst; therefore a little of some sower Syrup must be always mixt with them, that they may the more easily penetrate into the veins, and more strongly resist the febrile heat. ¶ I abstain on purpose from Syrups and Conerves in the Plague, and in all Fevers, and in the Bloody-flux; for because Sugar easily turns to choler, I certainly know, it affords fewel to the Fever and Bloody-flux. ¶ *Galen 11. meth.* says, That for the most part the rich are worse cured, than the poor; for which although he alledge other reasons, it is certain, that they who in these Fevers took Syrups, Conerves, and other things made up with Sugar, did usually dye. Sugar and Honey are too apt to turn to choler, and so they increase Fevers, and the Symptoms of Fevers. It is therefore expedient to use either fresh juices of herbs, or such as are dried for use; we having for precedents, *Mesfarius, Bucephalus*, and other most learned Italians.

Riverius.

XXII. Emulsions are usually more gratefull than Juleps, and are then especially of use, when the Fever is accompanied with a dry intemperature of Bowels, or a thin Catarrh, or an Inflammation of the Lungs and parts belonging to breathing. ¶ *Martianus comm. in lib. 2. de Dieta* 164. puts us in mind, that we must consider, what *Hippocrates* in that place says of Cucumber-seeds, that they moisten and inflame, because they are fat and oily. Thence he concludes, that the Moderns doe amiss, who use such seeds to cool: for if Cucumber-seed inflame, because fat, Melon-seed may much more doe it, whose flesh, by consent of all, is less cold than that of Cucumbers. Therefore, he being Judge, the use of them in Pustane, and in Emulsions is not so safe in Fevers, and especially where violence of heat prevails.

Poterius.

XXIII. Sorrel Juice is given in acute Fevers promiscuously, and at hours and days, wherein Nature uses often to move a *Crisis*. Which custome I can no ways approve, for then only a small quantity of things can be used, and that boiled, lest Nature be diverted from her office: So if onely an ounce, or half an ounce of the said juice, well boiled, and clarified by it self, were used, it would quickly be brought into act, and Nature would not be so much hurt by such things, nor have such an aversation to them.

Sennertus.

XXIV. Some use *Saccharum Saturni* in burning Fevers, and a Dysentery, from 3 grains to 4. But the use of it is not so safe: for it takes away Virility.

XXV. Epithems and Inunctions are frequently applied to the Brain, Heart and Liver, when the Fever is come to the state or declension. Before indeed it is not so safe, to cool by applying things: for that we might rather fear, the fire in the Bowels would be more kindled by *Antiperistasis* and constipation of the skin. Nor are they altogether so convenient, in my opinion, at any other time (except, it may be, in the process of the declension)

because here they would certainly hinder the free dissipation of abundance of fumes; and therefore would foment the Fever the longer. Applications indeed please the Patient, as long as they afford a sense of Cold; but a little after they doe harm, the heat being made hotter by keeping in. I should think it were better to apply Pigeons, Whelps, Lungs of Animals, &c. to the shaven head, breast, and *Hypochondria*, to the end the fumes may be drawn out, whereby cooling is caused much more conveniently. But however, so violent a heat does sometimes so weaken the sick, that unless we allow a mitigation of the heat by outward application, very bad Symptoms seize a Man, which it is better to prevent by a cure, not regular (as they call it) for we may, in a little time after, make amends for all the harm done. ¶ In burning Fevers I have found by experience nothing better to abate the heat of the Lungs and Breast, seeing the left hot the Lungs are, the left they heat the attracted Air. Therefore it is abated by moist and cold things, when the Fever dries the body, and the dryness increases the acrimony of the heat. And they are made of moist things, which were first invented by me, that is, of Oils, and Water of Pearl Barley, a little boiled, lest it should obstruct and hinder eventilation by its clamminess, and so a fault be committed worse than the first. They are made also of a decoction of the four greater Cold Seeds, or of a Decoction of Cucurbites, &c. ¶ It is very good to apply cooling Epithems to the Liver, and the whole region of the *Hypochondria*: for they do not onely promote concoction, but they also amend the intemperature of the Bowels, and hinder the principal parts from falling into a Consumption. Cooling things are also beneficially applied to the Stones, because of the consent they have with the principal parts. By reason of the same consent with the whole, cooling of the hands and feet does good. Nor do they hinder the evacuation of Excrements; for little flows from these parts; therefore more good than harm comes from cooling of them. ¶ Observe that Frontals, must be taken off on the critical day, that is, on the fourth and seventh, lest they hinder bleeding at the Nose, which usually puts an end to a burning Fever.

Joubertus

Rondeletius

Riverius

Enchir. Med.

XXVI. We must have a care of very cooling Meats (unless the violence of the heat, not regarding other evils, do require it.) For they both thicken the humours, and stop the passages. But the whole method of cure either consists in extinguishing the heat of the humours, or it shews how the boiling humours may transpire through the body: For a remission of the Fever is caused by transpiration of the hot humours, which we may attempt, either by opening the pores, or an equal diminution of the humours: Whence it comes to pass, that over cold and astringent things, by way of Food (the case is otherwise as to drink) are contrary both to reason and experience. Wherefore before a *crisis* we may not use them: for it often happens, that *crises* have a worse issue, Nature being made dull by the Cold, and the Pores almost shut.

Mercatus

XXVII. Sleep, which is disallowed by several all the time of the Fever (when the heat tends to the outward parts) left in it the heat should turn inwards, must be allowed, because it greatly recruits strength. But since it sufficiently shews, that the heat is drawn outwards, rather than inward in sleep, for that people use to be hottest, and sweat most in time of sleep, and for that very reason, and in that it quenches thirst, it likewise does good; there is no need to fear that, which rather does good, and therefore to keep people from sleep, and so weaken them more: Seeing in sleep nature is not called from her duty, because she is more intent upon the concoction of food, for in time of sleep she minds concoction less; but Nature's power is

Y

not

Platerus.

not idle in elaborating the cause of the disease when a Man is asleep: Yet in the mean time it is better to abstain from sleep in the very fit of a Fever.

XXVIII. If a Fever be protracted, Purging must in like manner be repeated, Preparations and Concoctions being given between whiles, till the whole Mine be taken away, for avoiding a relapse. Yet this rule wants a restriction: for if after several repeated Purges, a slow Fever continue, which insensibly consumes the Patient, and seems to cast him into a Consumption, it will be the best way to omit Purging, and to resist the Fever only by a course of Diet, and altering remedies. For it sometimes happens, where there is some ill disposition of the Bowels, by reason of the continuance of the Fever, that as long as Medicines are given, so long the Fever will continue; for Nature is wearied, which gathering strength again concocts the cause of the disease, and expells it when concocted. ¶ If a right fermentation of the blood have gone before, the despumation of the morbidick matter will be wholly made within the usual time: But if cooling Medicines, or Clysters, have been given too late, the Fever will run out a great deal longer, especially in elderly Men, that have been ill looked after: To whom I being sometimes called, after they had been sick of a Fever forty days and above, have tried every thing that I might bring a despumation on the blood; but the blood has been so weakened, partly by Age, partly by Clysters and cooling Medicines, that I could never attain my end, either by Cordials, or any other strengthening things; but either the strength of the Fever remained firm, or though the Fever seemed to be gone, the Patient's strength was very low, and well-nigh dead. And being deprived of success in other Medicines, I was glad to turn my counsel another way, with no common success, namely, by applying the lively and brisk heat of young persons to the Sick. Nor is there any reason that any one should wonder, why the Patient should be so much strengthened by this method, though unusual, and debilitated Nature helped, so that she may discharge her self of the reliques of the matter to be separated and discharged; since one may easily imagine, that good store of brisk *effluvia* is transfused from a sound and lively body into the exhausted body of the Sick. Nor could I ever find, that the repeated application of warm clothes was in any measure able to do that, which the method now prescribed did perform, where the heat applied is more conatural to Man's body, and also gentle, moist, equal and lasting. And this way of transmitting Spirits and Vapours, it may be Balsamick ones, into the Sick Man's Body, from the very time when I made use of it, although at first it seemed strange, has been made use of by others with great success.

Sydenham.

XXIX. In the cure of very acute and pernicious Fevers, we must take diligent notice of this, that they are seldom caused, without some inward and peculiar disaffection of some of the Inwards, and often with an Inflammation. Wherefore the cure of the *Hypochondria*, Head, Breast, Womb, Kidneys and Bladder, must never be omitted, that by some means or other we may find out, which of these parts is remarkably ill, and may help it as much as may be. ¶ As soon as I find a great burning in people in a Fever, if signs of an inward inflammation, which I diligently inquire, do not appear; yet I think of some such disaffection, and I direct the course of my cure thither, &c. Scarce ever any one of those Fevers appears, that burn violently, so as to have the tongue burnt, or wherein the Belly voids adust stuff; but some of the inner Bowels especially, suffers an inflammation, *Erysipelas*, or at least some overheating: And they are perceived by some remarkable hardness, swelling, pain or heat in that region, where the inward part is seated.

Vallesius.

XXX. But if by reason of much loss of blood, which the Patient has sustained in the method of his cure, or through often Vomiting or going to Stool, or because for the present the Fever is quite off, or because of his weakness, or of the age of the Fever already declining, there now remains no more danger of raising an Ebullition for the future, then, setting aside all fear, instead of a Paregorick draught, I give a pretty large dose of *Dia-scordium*, either without any thing else, or mixt with some Cordial-water. It is certainly an excellent Medicine, Sydenham. if it be given in such a quantity as may make up a Medicine, rather than an empty title.

XXXI. To the constitution of a Continual Fever we require, that its Cause be either in the Vessels that carry the Blood, and so in the Blood it self, and the multifarious parts of it, or such other part of the Body, as has continual commerce with the Blood, and so with the Heart it self; but so, as that it cannot be hindered, or interrupted, unless wholly, nor be restored again at certain times (which usually happens in Agues) by internal causes. We add, that the Blood may be so affected, sometimes by external, sometimes by internal causes, that it may produce a continual Fever. Among the external causes of this Epidemick Fever, I observed the Air was then very hot, and it penetrating as well the skin on all hands, and therefore the Blood it self, as being drawn into the Lungs, and there joined to the Blood, did not kindly temper it again, as it was in a ferment, according to Nature; but by communicating to it its fiery and saline volatile parts, it dissolved, melted and rarefied it too much, and so it greatly vitiated the vital Effervescency in the heart, with its additional heat, and produced a continual Fever. Among internal causes I blamed Bile bred of the same fiery and saline-volatile parts of the Air; but made more sharp, volatile and abundant by the sharp ones: and therefore causing a vitious effervescency as well in the small Guts, as the Heart it self, and indeed joined with notable heat, and therefore without doubt a Fever. The various, and in many respects vitious humours, which must of necessity be produced by the whole mass of Blood, being by little and little corrupted, could not so well be called the cause of the Continual Fever, that was then so rife, as of the various Symptoms, which did many ways vex divers Patients. The Cure therefore of the Continual Fever, as such, ought to consist, 1. In avoiding or correcting the bad Air. 2. In tempering the sharp Bile, fixing the volatile, and diminishing the abundance of it. 3. In moderating, stopping and reducing to its natural temper the vitious effervescency, that is indeed joined with a notable and troublesome heat. 4. In gently coagulating the Blood too much dissolved, condensing the too much rarefied, and cooling it, when over-hot, or reducing it to a laudable integrity, when it is otherwise vitiated. ¶ But though in the cure of our Fever we made no mention of Blood-letting (because we could very well want it, and several have been happily cured without it) yet it is not to be contemned, since especially it is usefull to temper the heat of the Blood, and to prevent Suffocation in Plethorick persons. Therefore it may be usefull for Plethorick persons, for young people, for those that are used to it, for those that are sensible of much heat, for those that desire it, and for those, who, in their imagination, conceive great benefit from it.

Fc. Sylvius.

Idem.

XXXII. Hippocrates, in a Legitimate Burning-fever, allows as much Water and Honey boiled (there must be store of Water) as the Patient shall desire, and he carries the Patient with this drink to the hour of the crisis: This is clear, because 4 de v. Acut. he writes in this manner; And, saith he, unless the critical days be over, you shall not give Broths: Understand with Galen, if the Patient's strength seem good. But if

if you be not confident of his strength, that he may be able to endure to the hour of *crisis* with drink alone; or though the strength be good for the present, yet if you fear a future imbecillity, or because he is of a thin habit, or accustomed to a full diet, you must give him such a sort of food; Boil Pearl barley in Spring-water, which is settled, either by boiling, or long standing; let there be one part Barley, and twenty of Water, boil it till the Barley swell and burst. (This drink may be the Patients diet, where strength is good, without fear of weakness.) Put it in a thin cloth, strain it hard, so as to cause the heart of the Barley to go out; mix this with store of Water, to make a thin broth of it, and give it with a little Sugar: If you mix a little sharp Syrup of Vinegar, so as to make the said broth a little sower, you will make most excellent food for this Fever.

Brutus, de
Vidu Febr.
l. 3. c. 1.

XXXIII. If a Burning fever come from salt phlegmatick matter, the Patients must be fed with a thicker diet, namely, thin Broth; Drink is not a Diet sufficient for such. Wherefore you shall use Broths after this manner; if there be strength, and the habit such, as that the Body waits not easily, and the Man be accustomed to live sparingly in his health: Let him take Broth made of the heart of the Barley, with Syrup of Vinegar, in the manner as is aforesaid. This Diet (and the like) you must understand is convenient for them that are not sick of a malignant burning Fever, which is known by the continual chillness of the extreme parts. Give therefore to them that are sick of a burning Fever from salt phlegm, Broth of Barley, or of Bread thrice washed, putting a good quantity of Syrup of Vinegar, so as it may be very sensible to the Palate. But if the faculty be weak, or if the habit of the Body, or custom give suspicion of future weakness, or if there be a Looseness from the beginning, wasting the Body, we may give Broth made of a Chicken, boiled on a slow fire, adding to it Prunes, and prepared Barley, with as many Kernels of a sower Pomegranate, as you can take in your hand.

Idem, c. 2.

XXXIV. But we must know, that when a burning Fever is bred of salt phlegm, if it be accompanied with a Looseness from the very first, it spends the strength of Nature much. Wherefore they stand in need of a thicker Diet, who are sick of such a Fever, especially if they be of a thin habit, and used to eat plentifully: Because the nature of a Man that is sick of such a Fever, is wasted by the gravity of the Symptoms, and the stubborn resistance of the humour, which will not yield to the concoctive faculty.

Idem, ibid.

XXXV. Hippocrates does most wisely advise 4. de rat. v. acut. to give attractory Broths in the cure of a malignant burning Fever, that is, he would have us mix Broth with a Purge, that draws: for he could not give a better name to a Purge mixt with Broth, than one compounded of either Simple. So Galen, in the Cure of an Inflammation of the Liver, uses Bark of Hellebore, Mercury and Fern in Pti-fane, and it is no vulgar rule in a violent or malignant Fever; Namely, when Purging is very necessary, and the Physician is afraid, because of the weakness of his Patient, he will doe advisedly, if, when he would give a Purge, he give it his Patient in Broth: For so the Physick will move him less, and will also heat and dry him the less, all which things happen in a violent and malignant Fever. Besides, a Purge so given less waits the strength of Nature. In a malignant or pestilent Fever it is the best way of giving a Purge, than which there is no other more sure, and with less damage.

Idem, c. 3.

XXXVI. Some Physicians do give the Pulp of Cucumber or Citrul in both the burning Fevers; others, Lettuce, Purslain; others, Almond-milk, Endive with Vinegar, or Juice of unripe Grapes, or of Berberies, or of Citron; but as much adverse as Astringents are to a legitimate burning Fever,

so much are powerfull Coolers to a bastard one; which you may understand chiefly from this reason; A legitimate burning Fever ends in Bleeding or Sweating, as we learn from Hippocrates, But what things are over potently cold, and they that bind, oppose both ends. That exceeding cold things are not convenient for a bastard one, is manifest from reason, because the humour of this Fever is difficult of Concoction, and for this reason especially, because it is a cold, glutinous and thick Phlegm, that causes this Fever, wherefore this Fever usually ends in an Abscess, as Galen, 4. de rat. v. writes; therefore any one may perceive that very powerfull Coolers are incommodious to this Fever: But Astringents, unless given upon the account of a Symptome, make both the sorts of burning Fevers pernicious, or of an ill *crisis*.

Idem, c. 48

XXXVII. The sort of Diet in both the Continent Fevers, is like to that we said was convenient for a burning Fever. For since both of them is a Fever, that has no intermission, it indicates, the Patient must be kept with drink. And, because this Fever seldom happens with a weak faculty, or a hot and dry constitution, nor with a thin habit of body; for this reason we inquire in this Fever onely concerning the Custom; whom therefore you shall know to have lived sparingly in their health, them you must onely nourish with drink.

Idem, c. 58

XXXVIII. In a putrid Continent we must observe before Bleeding, Purging or a Clyster, Barley-water must not be given for a good space of time, as Hippocrates teaches.

Idem,

XXXIX. We must not forget, that in this Continent one from Putrefaction, the Diet should be a little more solid: For a disposition from the corruption of humours indicates increase of food, according to Galen, aph. 8. Moreover, Nature sooner sinks under a Fever and Putrefaction seizing a man together, than under a Fever alone.

Idem,

XL. Our younger Physicians make their Meat in continent Fevers of Gourds, Spinage, Lettuce, Purslane and Pulp of Citruls. But since these are very acute Fevers, Nature cannot undergo them long; for a *crisis* comes quickly, wherein either Nature conquers or is conquered, as Galen, 1. ad Glau. writes, Therefore the Physician ought with all his diligence to take care, that he indispose not the ways either of the humour or the body to a *crisis*. But a Diet of cooling Herbs may sooner doe this than abate the fiery quality of the humour, or quench the Patient's thirst, which can scarce be laid by drinking a great quantity of cold water at one draught. Therefore in continent Fevers it is to be feared, lest a Diet of these very cooling Herbs cause either Death or an ill *crisis* by indisposing both the body and humours of the sick for Bleeding at the Nose and Sweating.

Idem, c. 61

XLI. Avicenna lays, there are some who will allow Ju-jubes and Vetches with Vinegar, and with Pomegranates, and with Sumach, when they have an intention to thicken the Blood, or when Nature is too soft. And he subjoins, And if any of these things be feared, because of their binding; lest, namely, it should make the Belly costive, its Astringency may be broken with Prunes or some such thing, and he may then be fed with Meat made of Gourds and Sorrel. And a cold Sallet is good made of Sorrel, Endive and Lettuce. But it may be some one may object, What advantage of any moment can follow the thickning of the Blood in a continent Fever, that for its sake he durst mix Sumach in Sallets in such a Fever? Yet he seems to have allowed it for a twofold reason, namely, either for thickning, or on account of a Symptome, as when the Belly is looser than it should; But for the thickning of the Blood, I think it by no means proper: For it seems not the part of a prudent Physician, in a Flux that comes either from the whole or from some one part unto another, to thicken the bilious Blood with things that are very astringent, lest perhaps we detain a superfluous

humour, when it is on motion, in some part of greater moment, or lest we fix that firmer which is in the part affected already. Now, in a continent Fever, the boiling Bloud swells high; like Water boiling in a Pot; you may abate the heat of this, and not take away the fire, if you slacken the fiery quality from the water; and this you may doe, either by pouring in cold water, or by uncovering the Pot, that it may be cooled by the Air. So also in a continent Fever, we may either abate the hot humour by drinking cold Water, or we must endeavour that the boiling fumes may freely transpire through the pores of the body; and this is the surer way to health, for a remission of the Fever may be caused by the transpiration of the fermenting humours, which may be done two ways, either when the pores of the whole are opened, or the humours are equally diminished, as Galen, in m. m. teaches. But Astringents, among which Sumach is a very violent one, they are so far from making perspiration free, that they hinder it, by stopping the body: for of the three causes that hinder transpiration, stopping of the body is one. Therefore from these things it is manifest, that Sumach, and other Astringents are too much enemies to continual Fevers, because they hinder transpiration, which is a cause of the remission of Fevers. We may use such as are moderate, upon the account of a Symptome.

XLII. Some give Pullets Livers roasted, after Broth, to them that are sick of a continual Fever, which I do not at all approve. For Meat stays a long time in the Stomachs of sick people, which is no small occasion why it is corrupted. Besides, a roasted Liver must be reckoned among drying Meats, wherefore it is not proper for one in a Fever, an argument whereof is Thirst, which it causes.

I. THAT we may make at least some conjecture about the Nature and Disposition of Agues, we must take notice that these three things ought to be considered in a Fit: 1. The time of Shaking. 2. Of Ebullition. 3. Of Despumation. As to Shaking, I think it arises hence, because the febrile matter, which being not as yet turgent was after a sort assimilated by the mass of blood, is now at length not onely useles, but become an enemy to Nature, does in a manner exagitate and provoke it; whence it comes to pass that, being irritated by a certain natural sense, and as it were endeavouring flight, it raises a Shivering and Shaking in the body, a true Witness of its Averfation: Just as purging Portions, taken by squeamish Persons, or Poisons, swallowed unawares, use presently to cause a Shivering and other Symptomes of that nature. Nature therefore being irritated in this manner (that I may come to the time of Ebullition) that she may the more easily keep this enemy from her Throat, falls upon Fermentation, namely, an usual Engine, which it is accustomed to make use of in Fevers and some other acute Diseases, when it endeavours to free the mass of blood from inbred enemies: for the disjoined parts of this peccant matter, which were equally mixt with the blood, do, by the benefit of this Effervescency, begin in some sort to be gathered together, and so may the more easily be wrought upon, so as to become fit for Despumation. By the name of Despumation I would have nothing else understood, than the Expulsion or Separation of the febrile matter now brought under and as it were conquered. And what is separated, has the nature partly (as we may observe in other Liqueurs) of Yeast, and partly of Lees. But the Fit returns, because the febrile matter is not as yet all gone, but as young Bees grow up insensibly at set times, so this latent matter, according to the nature of the Fits, shews its head again, and creates Nature a new trouble, running over the same course, which we have shewed before.

II. And of Agues, some belong to the Spring, others to Autumn. For although some arise in the intermediate seasons; yet, because they are not so frequent, and may be reduced to the former (to those namely, which they are nearest to) I shall therefore comprehend them under these two kinds. And indeed this distinction of Agues is so necessary, that unless in our practice we take notice carefully of it, we can neither make our prognostick aright how long they will last; nor keep our Patients bodies under a right regiment, with respect to the different nature both of the Seasons and the Agues. It is true indeed, the Agues of each Season have their nature not altogether unlike, whether you consider the manner of their first coming, which first begins with Shivering, by and by bursts out into Heat, and at last ends in a Sweat; or the difference of their Types, in respect whereof there are some Tertians both Spring and Fall; yet, in the mean time I do not doubt, but these Fevers are fully distinguished in their nature, or essentially.

III. And, that I may first speak of Vernal Agues, they are all either Quotidians or Tertians, and they come either sooner or later, according to the various disposition of the season. For in Winter time the Spirits are concentrated, and in their recess gather strength to themselves, which being now brisk, the heat of the approaching Sun draws out, and being mixt with the viscid humours (yet they are not so viscid, as those the heat of the foregoing Autumn has boiled and roasted) which Nature, during Winter,

Sydenham, Tract. de Febrilibus, p. 69.

Idem, p. 72.

ter, had gathered in the mass of blood, while they endeavour to fly away, are kept implicated, and as it were intangled, and so they cause the Vernal Ebullition: After the very same manner as Vessels full of Beer, and set long in a cold Cellar, if they be set near the fire, they presently begin to work, and the Liquour is apt to fly; The Blood being in this manner affected, endeavours the Purging of it self, and by the help of volatile Spirits does the business soon enough, unless perhaps it be too full of viscid juices, which may hinder the fermentation begun: And though this happen; yet the Vernal Effervescence is seldom continual and constant, but is usually parted into several fits. For the Blood being now turgid with these rich Spirits, Nature falls to her work as it were in haste, and makes a secretion of some parts by particular Paroxysms, after the manner of perfect solution, before she finish universal separation. And this seems no improper reason why in Spring-time, especially that part of it which is nearest Summer, we meet with few continual Fevers (unless perhaps the constitution be Epidemick) for the fermentations, that then arise, are either quickly laid, or hasten to an intermission; or finally, the parts of the humours being more prone to separation, are too hastily and with some violence translated to another place, from whence by and by Quinsseys, Peripneumonies, Pleurifies, &c. do grow, shewing their heads especially in the latter end of Spring.

Idem, p. 73.

IV. Therefore we may undertake these Agues various ways, and indeed with desired success, as it is abundantly manifest to me from frequent observation. Sometimes a Vomit given in season, namely, that it might do its work before the fit, succeeded well, especially if you give a large dose of *Diacondium* when the Vomit has done working, immediately before the fit comes. Sometimes you may observe Health recovered by Diaphoreticks, which may provoke Sweat arising in the end of a fit, covering the Patient well with clothes. And it must be done as much, and as long, as the Patient's strength will bear it, and this has often done the work in Spring-agues, especially in Quotidians. For the humours in this season not being very thick, the solution, that would otherwise be imperfect, grows to a perfect one, which indeed never happens in the Autumn. What shall I say, for that I have cured Tertians sometimes by the benefit of a Clyster, given on the intermission days, for three or four days together? Nevertheless, if those Spirits be depauperated and weakened, which should suddenly make themselves ready for despumation, either by reason of Phlebotomy celebrated with too liberal a hand, to which the season it self easily inclines the unwary, or through some antecedent weakness of the Patient, it may so happen, that these Vernal-agues may vye in length with the Autumnal; but, indeed, they last not quite so long, because they either end of themselves, or are more easily cured with light Medicines.

Idem, p. 74.

V. But Autumnal-agues are not so easily removed. If the Autumnal constitution be Epidemick, they use to come about the latter end of June: If not, they tarry till August and the beginning of September; in the following months they more rarely occur. Alsoon as a great troop of them comes together, you may observe the fits to come all at one and the same hour of the same day; the fits sometimes preventing and sometimes postponing, in the like manner and the same tenor, unless it so happen, that this order be altered or perverted in some bodies by Medicines which have a faculty of stopping or hastning the fit. In respect of their Types they are either Tertians or Quartans, and it may safely be said of Quartans, that they are the genuine off-spring of Autumn: Truly they are so near of kin one to another, that they are oftentimes found to take their turns, at least for a time; and it may

be presently they will return to their wonted *Genus*: But Vernal Tertians never put on the Types of Quartans, for they are as far different as Heaven and Earth. Nor farther have I ever observed a Quotidian come at that season, unless one will have a double Tertian or a treble Quartan in accurate speaking so called. Now, I suppose, these Agues derive their original in this manner; namely, as the year comes on, the blood also is exalted according to the rated proportion (just as all Vegetables shew the course of the year by their increase and declension) till they come to their height and utmost vigour: Then proceeding in parallel motions with the seasons of the year, and as the year declines, it also begins to be relaxed, and then especially when it is promoted by any accidental cause, suppose by immoderate loss of blood, taking cold, by crude and excrementitious meats, unseasonable use of bathing, &c. Now if the blood, constituted in this state of decedence, decay so far, as that it is not able to maintain its oeconomy, and protect its fortunes with its present stock, Nature, taking new advice, does at length incline to this, that it may prepare a certain new texture for the effete mass, and so endeavours an alteration of affairs, so contriving it, that the parts of the mass of blood, which are most subservient to change, may conveniently be separated. And hither tends the ebullition that was now caused, which seizing the blood sometimes, when it is very degenerate, the Fever arising from thence uses to be untoward, and full of malignant and horrible symptoms. However this comes to pass, that the blood being spoiled of a great part of its spirits, and much burnt by the foregoing Summer, performs its ebullition but by slow motions, and requires a very long period for its despumation.

Now, that it may appear how difficultly these Fevers admit a Cure, it must be considered in this place, that the difference of continual Fevers in this season and of Agues consists especially in this, that continual Fevers constantly carry on the effervescency in one and the same tenour, when once it is begun, and Agues perform the same at several turns and divers times. In the mean time fermentation is performed in both by Nature's duct in the space of 336 hours or thereabouts: for the mass of blood in a humane body is not usually purged sooner or later than so, if you leave the business to Nature, just as Cider, Wine and Beer, have each of them their peculiar period, wherein they are depurated. And although in Agues the blood sometimes (as it happens in a Quartan) endeavour its despumation in the space of six months, and at length perfect it; yet (if you calculate aright) there is not more time spent in performing it, than what naturally uses to be spent in continual Fevers, for 14 times 24 hours, or 14 natural days, make 336 hours; namely, allowing 5 hours and an half to every fit of a Quartan, you will have in a Quartan the value of 14 days, that is, of 336 hours. Now if any one should say, a Quartan, for example (for the like account is to be understood of other Agues) sometimes runs out beyond the space of six months, before it finishes its period: I answer, that the same thing is usually seen in continual Fevers, which are often protracted beyond 14 days: And in either case, if you have a care that the effervescency (especially towards the end of Fevers) go on well and in good order, and be kept up brisk, despumation will be finished within the space of time aforesaid, that is, in 14 days or 336 hours: But if at that time (that is, towards the declination of the Fever) you unseasonably hinder the effervescence either by Medicines that cool the fermentation, or by use of Clysters, and give a check to it, no wonder if they last long, because the order of Nature is disturbed: for by this means the tone of the blood is in a manner relaxed, wherefore

fore it cannot betake it self to despumation with the Disease; yea, and sometimes in weak and spent bodies the same happens spontaneously, unless you assist Nature languishing in them by the help of Cordials, that it may be sufficient for the despumation of the blood.

Idem.

VI. These things granted, no wonder if men build no other method of Cure upon them, than what is thought fit to be used in continual Fevers, to perform the work of despumation as it ought to be done, since doubtless they are distinguished by no discrimination from continual Fevers, if you consider the order wherein nature uses to expell the matter of them, that is, by an Effervescency comprehended within a certain period: Although as to what concerns their kind, and property of Nature, I do not deny, but they differ very much both from continual Fevers and among themselves. Therefore we must take an Indication either from cautiously and solicitously observing the method wherein Nature uses to rid her self of this Disease, that we may quicken fermentation, when arisen, and so recover our Patients: Or by searching into the specifick cause, we must doe our endeavour to meet with the Disease by effectual and specifick Remedies. Indications must be taken from one of these two. I have at one time or other gone both ways to work, and, I can modestly say it, not without very great care and intention of mind; but yet I am not arrived to that happiness, as to be able to remove autumnal Agues by any certain practice or method of cure, before they have finished these stated fermentations, how troublesome soever this may seem to people in Agues, who are so long against their will compelled to wait for their health. But indeed if a man can be found, who knows not only suddenly to stop the career of these Agues, but wholly to break it off, either by using some certain method, or some Specifick or other, I hold him obliged in Conscience to discover the thing. But as I think it a thing difficult enough, so I doubt not but it is likewise dangerous: A clear Instance whereof we may have from that they call the *Jesuits powder*; for although by the use of that Powder we may stop fermentation for the present, yet the matter still remaining, which should be dissipated by fermentation, in a short space of time gathers strength again, and proclaims a new War against Nature. I have known a Quartan continue for some years, while it was ever and anon disturbed by the repeated use of this Powder. Yea, this Powder, given immediately before the fit, has taken several away out of this life; though I will not deny but such Medicines given prudently and cautiously towards the latter end of these Agues has sometimes done good; especially, if they be given in a season, wherein these Diseases are not very epidemical. ¶ Nevertheless, although from what we have now observed, we can scarce have any hope of recovering health soon, yet room is left for a Learned and Sagacious Physician, to procure a due depuration of the blood, to the end it may be finished within the bounds set by Nature, and also to prevent those Symptoms which usually come upon this Disease. Therefore I will in a few words, and as the nature of the thing will bear, briefly treat of this matter, comprehending both kinds under the same Head, because the same Cure is proper for both, that is, for a Tertian and a Quartan.

Idem, p. 82.

VII. If therefore the Patient, that is taken with either of these Agues, be either an Infant, or in the Flower of his age, it is altogether convenient (as far as I am hitherto informed) to attempt nothing by the help of any Medicines, or by the change of Air or Diet, for to this day I never yet observed any ill ensue upon it, if so be I left the matter to Nature wholly. A thing that I have often observed, not without admiration, especially

in Infants, for when the blood has finished its depuration, these Agues vanish of their own accord. But, on the contrary, if you either use a stricter course of life, or now and then use purging Medicines (for they use to be given on pretence, that obstructions may be opened, and humours residing in the first ways may be carried off) or, which is the main thing, if you let blood in an epidemick constitution, it will make the Disease continue a long time, and the Patients exposed to a thousand dangerous Symptoms.

Idem, ibid.

VIII. But if the Aguish persons be of elder years there is great danger in both Diseases, not onely of their continuance, but of death it self. Here therefore the Physician must make it his business to assist Nature, and give her those Aids which she stands in need of to doe her office. For certainly, in weakly bodies, unless fermentation be kept up by benefit of Cordials and a strengthening Diet, it will so come to pass, that the Patients being vexed with uncertain and fruitless Paroxysms, are weakened, and the Disease will continue so long, till Nature, languid before, be seized with some violent fit, and is not able to reach to the time of ebullition, and so the Patients end their days in the cold fit. And this often happens in old Men, who have been weakened with a long course of Purging, yea, (as I have sometimes seen) they have quite fainted in the first cold fit, when by giving some strong Cordial, they might have been kept up for some time at least. When the blood has spent as much time as is required to finish despumation, it is necessary that the elderly Patients, at that very time, or a little before, do undergo some remarkable change of Air, either (which is rather to be wished) by going into some hotter Countrey, or at least by changing the place wherein they were first taken with this Disease. Truly it is wonderful of what avail this change of Air is towards the thorough cure of this Disease; in the mean time it is not onely unnecessary for the Recovery from this Disease, to change the Air before this very time, but inconvenient: For let a Man go into never so Southerly and hot a Clime; yet if the blood be once got into such a morbid motion, it is necessary that it finish its depuration, which advantage indeed will be in vain expected from an unusual and new Air, before a Man be capable of Recovery by the blood's motion proceeding and being become ripe. Therefore that remarkable change of Air must then first be undertaken, when the Patient can be first rid of his fit; for example, in a Quartan, that first came in Autumn, the Air must not be changed till about the beginning of February. In the mean time, if the Patient be either unwilling to change Place, or cannot conveniently, it is needfull at the article of the very time, to use some strong Medicine, whose strength may be such, that it may at one stroke as it were, powerfully promote the languishing depuration, and, if it can be done, finish it. For this purpose I should advise to give a drachm and an half of Venice Treacle or *Electuarium de Ovo* dissolved in two ounces of *Aqua Calensis* or *Aqua Vita*. A thing which I have done with no unhappy success in the declination of such Diseases: Although I acknowledge, these hot things, given sooner, either double the Disease, or turn it into a continual Fever, which has been long since observed by several. The same may be used in young People who are held of this Disease, using caution. But to doe the same in Childhood is not onely inconvenient, but also not without danger, as I have long since observed.

Idem, p. 82.

IX. It must be observed, in the beginning of these Diseases (of a Tertian especially) that it sometimes happens that the effervescence in young and strong men is so far increased, that you might deservedly think it safer to prevent the storm in coming than to commit the whole affair to Nature; And

And this may be done most conveniently by giving a Vomit on the intermission day; for such sort of Medicines are very convenient for most autumnal Diseases, and prevent those symptoms whereunto they are obnoxious in the height: But when this is done, the whole affair must be left to Nature. And sometimes it happens that autumnal Tertians (in young People especially) out of the violence of their effervescency, and their mad motion, do finish their depuration before the determinate time, and so after a few fits vanish, the work of Nature being certainly precipitated. But Quartans do not so quickly finish their course, unless perhaps the Patient have been formerly sick of the same Disease; for in this case, although he may be exercised with some fits; yet the Physician, being assured of the thing, may boldly predict the Disease will suddenly vanish, which is worth observation.

Idem, p. 85.

X. When the Ague is over, the Patient must be carefully purged; for abundance of Diseases follow upon want of purging after autumnal Agues. But you must take diligent heed; for if, when the fits are ceased, you fall too soon on Purging, there is danger they will return, namely, from the disturbance, which even the more gentle Purges use

Idem, p. 88.

XI. That the blood may be reduced to its natural temper, Vomiting, Bleeding and Purging are of great use, especially if they be given in the beginning of a Disease. Vomits doe good, in as much as they cleanse the Stomach, that the first Concotion may better be performed, and thereby more pure nutritious Chyme may be supplied for the matter of the blood, but especially inasmuch as they discharge Choler, while they plentifully strain out the Gall-bladder by the Gall-passage, that by this means the Bile may more perfectly be washed from the mass of blood, and that so the blood may be purified from the adult recrements of Salt and Sulphur. Letting blood cools and gives vent to the blood, and therefore it is less scorched, and is more freely circulated in the Vessels without danger of Adulion. Likewise Purging does plentifully squeeze out Bile from the bile Vessels, and consequently from the mass of blood. To this end (that is, the Reduction of the blood) Digestives, Sowre things, Attenuants do conduce, inasmuch as they give fusion to and alter the blood, and allay its heat. But Vomiting, Purging and Bleeding, unless they be immediately celebrated at the very beginning, they doe little good; yea, they often use to doe harm, for while the blood is full of vital Spirit, its indisposition may be corrected and amended with ease. Wherefore, if about the beginning Bile be plentifully discharged, or the blood cooled, it is reduced to its natural temper; yet afterwards, in the progress of the Disease (when the Spirit is much spent, and the Salt and Sulphur are too much exalted) if such evacuations be used, they much debilitate the frame of the blood: And therefore it is evident from observation, that the Ague is seldom or scarce ever cured by these Remedies, used late. I have known some in the Spring-time, who, enjoying their health well enough, upon taking a strong Vomit for prevention sake, that wrought violently, have presently fallen into a Tertian; And others sometimes, who being cured of an Ague, upon taking a strong Purge to carry off the Remainder of the febrile matter, have presently relapsed. One would be ready to say, that the matter of this Disease, before laid asleep, was by this means stirred up; and brought into act, by the Purge; Yet, if you consider the thing a-right, one would rather say, that the frame of the blood is much hurt by the violent Purge; and whereas before it was prone to a bilious dyscrasia, so as it could scarce assimilate the alibile Juice, it will presently, for this evident cause, degenerate the more, and immediately pervert the

nourishment into fermentative matter, and so be susceptible of a feverish disposition.

Willis, de Febr. c. 4.

XII. The hindring an Ague fit is accomplished by Medicines which stop fermentation; And although this Remedy be among Physicians accounted immethodical and very uncertain; yet it is certain that Agues have been often cured in this manner, when Medicines would doe no good at all. Onely here we must observe this, that the use of such things is most beneficial after Purging and Bleeding, if this be necessary; and unless these things be rightly premised, the other seldom stop a fit. There are not wanting Men, who to abate or stop the fit give Opiates. On the other hand also there are some, who judge, that Agues must not be stoppt at the very first, but that the fit should be suffered for awhile. Hence, an Ague once begun, if it end in any reasonable time, is vulgarly termed rather Physick, than a Disease; for by this means the impurities of the blood blaze out, the obstructions of the bowels are opened, and, indeed, the whole body receives Vent; so that it is wholly freed from all excrementitious matter, and from the Seminary of growing Diseases. And we grant this in part, to wit, if it end in a reasonable time; but if it be protracted long, it is the cause of many Diseases and long Sickness: For hereby the mass of blood is much spoiled of the vital spirit, and like over-high fermented Wine, it palls: In the mean time, the saline and earthy parts are too much exalted, wherefore the Jaundice, Scurvey, Dropsie, and other Cachexies follow this Fever too late cured. For as a House set on fire from without, is easilier delivered from danger of Burning, than if Vulcan were pulling down the inner Rooms, so also it is more easie to drive away Agues from humane bodies in the beginning, than after the Agues have invaded the inner oeconomy of the bowels. And of a depurative fermentation of the humours, if it should exceed measure, a corruptive one may easily be made.

Willis, ibid.

Frid. Hoffmannus, m. m. p. 274.

Sylvius his method of Cure.

XIII. Forasmuch as we have made the Cause of Agues, as Agues, to be the pancreatick Juice, by reason of an Obstruction made in its lateral Duets, by Phlegm coagulated therein, and then made sharper and Sowrer by stagnation, and carried hence, by making way through the obstructing Phlegm, to the small Guts, and there vitiously fermenting with the Bile in its way and the Phlegm in the Guts, and then at length creeping along with them under one form or other to the right Ventricle of the Heart, and in it not onely by irritating the Heart with its acrimony or flatulency raising a more frequent Pulse, but moreover divers ways altering and disturbing the vital effervescency and sanguification it self, and producing many symptoms in divers places: Their Cure may be performed, if first, the obstructing Phlegm, that is more or less glutinous and coagulated, be cut and loosned, and then, as offending in Place, be removed, and at least be brought as far as the small Guts, if not cleared of the Body it self. Secondly, if the acidity and acrimony of the pancreatick Juice, that is increased, be tempered and corrected. Thirdly, if the vitious effervescency of the Bile in the small Guts be hindered or amended. The obstructing Phlegm is cut by Aromatics and any volatile Salt, but especially so used, that the whole body may be hot at once, to the end the virtue of the Medicine being dispersed every way may reach also to the Pancreas it self, and to its Lateral Duets, and so to the place affected, and the Source of the Disease; Which things are proper especially for phlegmatick and melancholick Persons. Let the following Mixture serve for an Instance, a spoonfull of it at a time to be taken several times a-day; But two or three

or three hours before the coming of a new fit, to take three spoonfulls of it, at the same time gently increasing the heat of the body either by motion, or cloths, or fire, or a bath, till the Sweat come, for so it will doe more good, and sometimes take the Ague happily away: Take of Waters of Parsley 2 ounces, Fenil 1 ounce, *Theriac. simpl.* or *Vite Matthioli*, 1 ounce and an half; Volatile Salt of Amber 1 scruple, Syrup of *Carduus benedictus* 1 ounce. Mix them. As often as the complexion of the Patient is observed to be cholerick, use loofners and fowre cutters; Take of Fumitory-water 3 ounces, *Sal Ammoniac*, or *Tartarum Vitriolatum*, 1 drachm; *Antimonium Diaphoreticum* half a drachm, Syrup of Fenil 1 ounce. Mix them. As often as both phlegmatick and cholerick humours abound in the same Patient, of the two Subcontraries that were now commended, these Mixtures may be made; Take of the Waters of *Carduus benedictus*, Cichory, each 1 ounce and an half; *Theriac. simpl.* distilled Vinegar, each 6 drachms; Crabs-eyes in Powder half a drachm, Syrup of the five opening roots 1 ounce. Mix them. If the obstructing Phlegm be not very glutinous, oftentimes at once such Sweating the obstruction is wholly removed, and the cause of it is carried into the small Guts, and the Ague is cured. In a Body that has but little Phlegm in it, but more Bile, a Vomit may be given three or four hours before the return of the fit, by means whereof not only the redounding Bile, but also the obstructing Phlegm is forced to the small Guts, hence to the Stomach, and at last out at the Throat and Mouth, and so the Ague is said to be destroyed. To which end I have often with success used a Vomitory *Sapa* prepared by me of Glasse of Antimony, and other Medicines may in like manner be prepared of Antimony, which is here proper above all other things. Things that purge downwards now and then will doe the same thing; but ever adding things that at the same time cut and carry off viscid Phlegm; for example, Take of the mass of *Pilul. fetid. maj.* half a scruple, Trochiscs of *Albantal*, *Mercurius dulcis*, each 5 grains; Oil of Amber 2 drops. Mix them. Make 5 Pills. Let them be taken four or five hours before the next fit, and they will purge gently. The augmented acidity and acrimony of the pancreatick Juice will be happily allayed with volatile Salts, and all Aromatics, not neglecting Opiates: Therefore the Mixture above proposed of Waters of Parsley, Fenil, &c. will be proper, which will be more effectual, if there be added to it of *Laudanum Opiatum* 3 grains, Oil of Cloves 2 drops. The vitious effervescence of the same pancreatick Juice and of the Bile will be hindered, at least corrected by the now commended Mixture, especially because of the *Opium*, wonderfully allaying and tempering both the Sharps with its Oiliness; and from these few Receipts any young Practiser may easily invent others, as he shall have occasion.

Sylvius de le
Buc. Frax.
Med. l. 1.
c. 30.

As well Acids, as Aromatics and volatile Salts, do every where dissolve and cut glutinous Phlegm. They will dissolve it in the forementioned Ducts, if they be carried thither. And all Medicines are carried sooner and in greater power, if they either be Evacuators, or joined to Evacuators; For this seems peculiar in Evacuators by Vomit, Stool, Urine, Sweat and Salivation, that they make no long stay in the Stomach and Guts, but, unless they be hindered by the humours and food, they pass quickly into the lacteal Veins and Heart, and hence every way with the Blood. But in our case, that is, in Agues, it has been observed by long experience that Sudorifics above all other things do most easily conduce to overcome the cause of them, by help whereof the very common People cure Agues.

And Sudorifics seem to be proper above other things, because Sweat is not raised, till the whole

blood be moved, which then also is made more fluid than usual, wherefore whatever things are mixt with the blood, are both sooner and more abundantly dispersed every way with it; and therefore Medicines designed to loosen Phlegm.

But as Medicines to loosen Phlegm must especially be mixt with Sudorifics, so also Medicines, that move the same from its place, are preferred, whether Purges or Vomits. For the way is but short from thence to the small Guts, and hence to the Stomach, whence the Phlegm may be cast up, and oftentimes a Tertian may be killed at one Vomit, it owing its original not to very tough or copious Phlegm. So there is an ordinary and easie way for the humours downwards to the small Guts, especially when they are thrust down thither by Purges. And thus I have often observed, Agues have been cured quickly and safely, especially Tertians, by Sweating, Vomiting and Purging, because they are the easiest cured of all, as for the most part they have their rise from small Obstruction, that is, from less tenaceous Phlegm obstructing the said Ducts. Therefore to loosen and make fluid the Phlegm stopping the said passages, Sudorifics above all other things, made of Aromatics and volatile Salts, as also of subtil Acids, and often taken at any time, although Sweat do not always come, do conduce.

To remove the same from an improper place, when it is loosed, 1. The same Sudorifics are proper, but taken not long before the coming of the fit, the Body being rightly constituted to promote Sweat. 2. Vomits and Purges taken about four hours before the coming of the fit, that so in the mean time the humour first made more fluid by Sudorifics, may be farther prepared for its discharge, and so with the stagnant juice may be displaced and thrown out of the body. 3. Volatile Salts and other Aromatics do most effectually mitigate and temper the pancreatick Juice, made more acid by its stay and stagnation, because they most easily penetrate every way, and do not only break the foresaid augmented Acidity, but also cut and loosen the obstructing Phlegm, and so are proper upon several accounts. Because volatile Salts are pure and not oily, they foment or increase no heat, a thing very usually arising and troublesome in the increase of the fit, which cannot be said of Aromatics, seeing the febrile heat is often not a little encreased by them.

Wherefore in the choice of proper Medicines for curing Agues we must take especial notice of the natural and preternatural constitution of every Patient, and therefore of the humours that are most abundant and peccant, and more yet of the Symptoms usually arising with the Ague fit, and especially of the Cold and Heat, as most troublesome to Patients.

Truly the efficacy of volatile Salts is very great, and moreover their operation is both very safe and innocent; which cannot always be said of several parts of Plants and Medicines made thereof, because they produce a more manifest and often a troublesome Heat to us, to say nothing farther now of the Cold, which likewise is frequently raised by Vegetables; but not so by the volatile Salt of Animals, which are not at all oily, such as may easily be prepared. From whence the utility of volatile Salts in curing Agues does farther appear, for that they alone answer several Indications; and, 1. To loosen obstructing Phlegm, and move it from its place. 2. To temper the pancreatick Juice, when made more acid, which last cannot be done by any Acids, how spirituous soever: And we said, they are requisite for the Cure of Agues. 3. That the febrile effervescency may be checked, quieted and corrected, as well in the small Guts as in the Heart, a thing which in particular Anodynes and Narcotics or Opiates doe, as also all other things, which

which incline towards their Nature, such as the fixt Sulphurs of Minerals and Metals, and therefore sometime called Anodynes, sometime Narcoticks. Now Anodynes, and especially Narcoticks, do so far forth check and correct the vitious effervescency, and by reason of the encreased Acid, too much, as they do powerfully, though kindly also, dull the very sharp Acid, as well upon the score of the Oil, as of the volatile Salt, that is in *Opium*: But the fixt Sulphurs of Minerals and Metals are much better than Opiates, because they have a kinder operation, and are destitute of a narcotick virtue, causing onely a gentle Sleep, in no wise a Stupidity, be they used in never so large a quantity, which cannot truly be said of Opiates: but these may be added to other Medicines, that are always commended for curing of Agues, as such, and to some, for to mitigate or take away the concomitant Symptoms.

Idem.

XIV. But here a Question seems to arise, Whether blood ought to be let in Agues, as such? since many have urged it, nay, and fly to it, as to the Sheet-anchor, for the right Cure of Fevers, and they think that a right method of Cure has not been used, if letting blood have been neglected. But their Assertion is built on a false foundation, that is, That every Fever consists in Heat in the Heart, and thence too much increased the whole body over. Which although it be observed to have place in most acute and burning Fevers, yet it is not always and universally true, since there do not onely occur Seasons in Agues, but in continual Fevers also, wherein too great Heat is so far from being found in the body, that, on the contrary, Cold does then trouble the Patients, not onely a small one, but oftentimes a most chilling one, tormenting them for several hours: To say nothing now of Fevers that are truly and always chill, and endure continually cold. But because according to their Rule, One Absurdity being granted, a Thousand follow, no wonder if Physicians, building upon this false foundation and principle have here also proceeded amiss in the Cure of their Patients. For although many Aguish persons have been very well after letting blood; yet it does not follow that the same Remedy is good for all; since especially not unfrequent Instances occur of them to whom Bleeding has not onely been useless, but plainly hurtfull. From which double, and indeed contrary Experiment, it can truly and onely be concluded, that taking away Blood does sometimes good and sometimes harm, in the Cure not onely of Agues but of Continual fevers also. Wherefore it concerns Physicians, if they will be accounted Rational, to understand the reason, why diminution of Blood does sometimes good and sometimes harm in the cure of Fevers, that a Rule may be made, when a Physician ought to use Bleeding, and when he should let it alone. That therefore I may conclude something certain in this Question, I doubt not to affirm, since Bleeding administered in Agues has not always done good, but often hurt, that it is not proper for Agues, as such, but that it is convenient and hath hitherto done good onely to certain Symptoms joined to this or that Ague. But a prodigal Lavisher of humane blood will urge, Has not an Ague been by once Bleeding, and taking away a large quantity of blood, cured, and therefore is it not a fit Help and Remedy for curing it? To which I answer, Many slight Diseases are cured of themselves, onely by ordering ones Diet aright, wherefore it is no wonder, when besides evacuation of blood, proper in Plethorick Bodies, a laudable Diet is observed, if an Ague be sometimes cured, which the laudable Diet alone might have cured. And it often cures slight Agues, which consists, 1. In taking of little Food, that easily ferments, and especially liquid, and such as conduces to promote a gentle Sweat. 2. In a little more violent motion

of the Body, and indeed even till the Sweat burst out. 3. In a warm Air, and covering the Body with many clothes to provoke a gentle Sweat. All which things rightly observed, which do not increase Phlegm, that makes or is about to make an obstruction, the obstructing Phlegm is easily dissolved by the pancreatick Juice now become more powerfull, and upon the coming of a gentle Sweat it is driven into the small Guts. No wonder therefore, if sometimes, where the Ague is slight, where there is a *Plethora*, where a laudable Diet is at least in part observed, such an Ague be cured in the beginning, when a Vein is bled. Which Cure is not all owing to the letting of blood, but especially to the alteration following a laudable Diet: Yet I will not deny, but the Cure of this Ague is promoted by the said breathing of a Vein, as often as there is a *Plethora* and Burning Heat accompanying the Fits; for not onely the danger of Suffocation is removed, and of Extinction of the vital heat by too much blood, so filling the Vessels, that there is not room for it, when it is rarefied, to be received into the Heart, especially when it is more than usually rarefied, while the acute febrile Heat continues; but the hurtfull Burning in the Blood also is diminished. And these Dangers are prevented by letting blood in time, and taking away enough of it: Besides, Sweat usually follows upon such evacuation, which is ever good for the Cure of Agues, especially when it is with the refreshment of the Patient, and he can bear it well, and when it agrees with him. Therefore Bleeding seems convenient not of it self, but onely by accident, not always, but onely sometimes, in the Cure of Agues.

Idem.

XV. I said, Sweat was proper for the Cure of an Ague, since it may, yea, ought to be known to all Physicians, that it is an ill sign, whenever no Sweat follows the fit towards the latter end, that is, the declension. For such Agues are usually of long continuance, as, on the contrary, they are usually short where every Paroxysm ends in a Sweat, so that such a Diet be then observed as may not hinder the Sweat nor foment or increase any ill humours in the body. ¶ Scarce any Ague is perfectly finished without a Sweat, and no man in an Ague can well promise himself perfect health who cannot sweat. Want of Transpiration is one of the chief causes of Agues, and may be alone sufficient to cause one, and other causes without this can scarce cause an Ague. But concerning Sudorificks we must take notice, that they be sufficient, and not onely stir the matter, but also drive it out of the body; for unless Patients sweat, after they have taken them, they oftentimes fall into a more violent Ague: And then, that they be not given onely once, but repeated as often as there is occasion; for onely one Sweat cannot always carry off all the matter, but if you stop there, the matter is rather stirred, than perfectly evacuated: And Nature by the repetition of them must be so accustomed to the Work, that of her self she may always void what should be voided, for if they be not rightly given, simple Agues become double. The common People do often, as soon as they perceive an Ague fit come upon them, immediately take a Sweat, which some Physicians do not disapprove, because experience testifies, that Agues beginning may by this means be prevented. Yet, I think, they cannot be given with safety in all bodies, and that they cannot be used aright except in the beginning: for if there be great store of filth in the body, or if the putrefaction and corruption of the humours have gone any thing far, they scarce doe any good; unless we think fit to doe, as *Rulandus* does in his Centuries, and we have a mind to discuss the matter, by several times giving strong Sudorificks.

Sennertus;
de Febr. l. 2.
c. 8.

XVI. Concerning the Cure of Quotidians, Tertians, Quartans, &c. we give this advice, that since

Z

we

we ascribe them not to different humours, Phlegm, Bile, &c. as to obstructing Phlegm or the pancreatic Juice variously disposed, we must not have so much regard to the interval of every return, as to the diversity of the concomitant Symptoms, and especially of Heat and Cold: For although, for example, Tertians for the most part come in Summer time, Youth, and especially in Choleric persons, upon which score we may justly have respect to Bile; yet there are not wanting Tertians, which while the Cold is violent, seize old Men and Children, in which Phlegm abounds, in which case if one should have regard to the tempering or purging of Bile, he would be much mistaken; for as a great Heat, the effect of Bile, is observed in most, so in some little or no heat at all is observed, according to the variety of whose being present or absent, the Cure is to be varied. Therefore we must always have regard to all the Humours that any way offend in the Body, seeing they are the cause, why the obstructing Phlegm is more or less sharp, and therefore why the fit varies in all its circumstances and symptoms: For as often as Bile has dominion in the Body, so often will Phlegm be less viscous, and the Pancreatic Juice less sharp, and therefore the Ague will upon this account be cured with greater ease and speed, if so be it be cured aright: But as often as Phlegm shall predominate above the rest of the humours, so often will the Pancreatic Juice and bile be more dull, and so the obstructing Phlegm it self will be more glutinous, wherefore the Ague will be cured more slowly, though easily enough, having all its symptoms commonly more slight: And as often as the redundant Acid exceeds the other humours, so often will the bile be more broken and dull, but then the Phlegm is more glutinous, and especially when the acid inclines to acrimony: Sometimes it is more fluid and ferous, especially when the Acid is sharp, and bile is intimately mixt with the saline part, and together with the more fluid Phlegm makes a salt Serum, but a briny one; wherefore then the Ague will be cured more slowly and difficultly. But after what manner he should proceed, the Reader may gather from what has been said before.

Syvius.

XVII. Specificks for Fevers seem to have place chiefly in Agues: some of them fix the morbid cause, not onely by their Narcotick Sulphur, or, as others will have it, by their Salt, but also they dissolve, and they consist of Opiates: Others by precipitating, they abound in a fixt Salt, and act by stopping fermentation and ebullition, Such are Crabs eyes: Others act by sweating, and when they have raised a sweat, they exert their antifebrile virtue. Some of them are internal, and use to be given an hour or two before the fit, and they doe good especially to Bodies that are not very foul: for unless the source be exhausted by Universals, they may produce abundance of mischief. This is commonly known, Half a drachm of *Cardus Benedictus* Leaves powdered, taken in a little warm Wine. Some antifebrile Specificks act by evacuating, such is that of *Riverius* in the Appendix of his Centuries.

Rolfink.
de Febr.
c. 103.

XVIII. Empirical Remedies that cure Agues, are such as keep off the fit as it is coming, without any evacuation, either taken inwards, or applied outwardly, especially where the Pulse beats, and are chiefly tied to the region of the Heart, the Wrists, or the Soles of the feet. The reason of their effect consists in this, that by the use of them the turgescency and fermentation of the Blood with the febrile matter may be stopt: That is, some Corpuscles or Effluvia are communicated from the Medicine bound about the Vessels to the Blood, which very much fix and bind the particles of it, or by fusing and moving do as it were precipitate it. The spontaneous heat of the Blood is hindered either way, just as when cold water is poured into a boiling Pot, or as when Vinegar or Alum is poured into new Beer, as it is working, the wor-

king presently ceases, and the liquor acquires a new taste and consistency. Things that are taken inward have this tendency, to break off the habit of habitual Paroxysms, which if we obtain, Nature recollects her self, and upon her proper motion easily recovers her former state of health. And although such an Intention be sometimes accomplished by giving a Vomit a little before the fit (for it often stops the febrile motion of the Blood by raising another motion contrary to this) yet this indication may far more certainly be accomplished by such Medicines, as do not at all evacuate from the Bowels, but bring a certain fixation or precipitation of the febrile matter for the time, upon the Blood. Whom I had in my hands to cure, having first given a Vomit or a gentle Purge, about three hours before the fit, I applied Plasters to the Wrists, and at the same time gave them some Febrifuge Powder in generous Wine, and ordered my Patients to be kept in a gentle sweat in Bed. It seldom so fell out, but at the first or second time the Ague was by this means stopt, and by repeating the Remedy a few times, the Disease was perfectly cured. Here something must be said of that famous Febrifuge, the Peruvian Bark, otherwise called *China China*, or the Jesuits Bark. The common way of giving it is, to infuse 2 drachms of the Powder in thin or generous Wine, in a Vessel close stopt for two hours, and then, as the fit is coming, to give the Liquor and the Powder to the Patient as he lies in his Bed. This potion sometimes stops the fit, as it is coming; yet oftentimes this coming after its usual manner, it prevents the next following. But however the fit be stopt at the first, second or third period, and the Disease seem to be cured, it usually returns in twenty or thirty days: And then the Powder being given again, the fit is staved off about the same space of time, and in this manner I have known those that have been troubled with Quartans, who have had but a very few fits all the Autumn and Winter, and so have kept the Enemy at Push of Pike, till the Spring coming on, by the help of the season of the year and Physick, the disposition of the Blood was altered for the better, and so the disease by degrees has vanished. Those who in this manner got truce of their Quartans, went brisk and chearfull about their business; whereas otherwise they grew feeble and pale, and were reduced to a languishing and a vitious habit of body: Scarce one of an hundred tried this remedy in vain. It is not onely given in a Quartan, but in other sorts of Agues, with success. But they that stop Agues with this Medicine onely, seem to give cheating Physick. But the use of this Medicine will be onely proper, when the Patient's strength is too much spent with too great frequency of the fits, and a truce is by this means procured; that Nature may recollect her self, and thenceforth more powerfully oppose the Enemy.

Willis, de
Febr. c. 6.

XIX. *Riverius* called Water impregnated with the Salt of Tartar his *Aqua Febrifuga*. He infused Salt of Tartar, and Spirit of Sulphur with a drachm or two of *Senna*, and sometimes half a drachm of *Jalap*, either in Spring-water onely, or in some appropriate decoction, so he cured all Agues, even Quartans. He also called *Mercurius dulcis*, six times sublimed, *Calomelanos*, which certainly makes a laudable and never a noxious Purge: The dose is to 1 Scruple, whether Refin of *Jalap*, or of *Scammony*, half a scruple, whose Dose may be diminished or increased. And he affirms he never saw any other effect than good from this Medicine in innumerable cases and in all ages.

XX. Beside these things which stop and check the vitious Effervescency by contempering the effervescent sharp things, Anodynes and Narcoticks that abound with Sulphur and Oil, are good, as also are spirituous and watry things: They indeed, while they mitigate both the Sharps (the alkaline and the acid.) These, while they dilute and weaken them both,

both, which I have demonstrated to be true by many experiments more than once. Hence it is that Spirit of Wine it self, and divers waters made with Spirit of Wine, as Juniper-Water, Treacle-Water, &c. are often given to sick persons, before they are taken with the Ague, with good success: But it must be observed that here is need of circumspection, since it is not alike convenient to give any Spirit of Wine to all sorts of People; nor can it well be given to any but to them who are infected with troublesome and grievous Cold. As distilled Vinegar, or other acids, use properly to be given to them who are troubled with grievous heat. And both of them mixt together, to whom both Cold and Heat use to be troublesome.

Sylvius de
le Boë.

XXI. Curative Intentions for Agues, seem (as I think) to be these. 1. The restitution of the Blood to its natural temper. 2. The preventing the depravation of the nutritious juice. 3. The stopping of the febrile fermentation, that a fit do not arise. As to the first, Vomits, Bleeding and Purging are of great use, especially if they be celebrated in the beginning of the Disease. The second Intention is accomplished by an exact course of Diet. The third, by remedies which stop the fermentation of the blood: And although this Remedy be accounted among Physicians Empirical, immethodical and incertain; yet I have often found that Agues have been cured in this manner, when Physick would doe no good, if so be they were used after Physick and Bleeding.

Willis de
Febr. cap. 4.

XXII. Whether at the very time of a cold fit in an Ague, or at any other time, when the Body is all over cold, the Blood be also very cold, I am not able to determine; for I never durst prescribe bleeding at that time, and so could never touch the Blood, as it came out, which they might tell, who make no scruple to let blood at that time. If this should be done, and the blood should then be observed to be cold, I think no prudent Physician would easily proceed to Blood-letting, seeing by it both the heat of the Blood is diminished, and therefore the Cold increased in it, than which nothing is more hurtfull, more ready and able to take away Life: for Life consists in Heat, as Death does in Cold.

Sylvius de
le Boë.

XXIII. If in any Ague whatever, when any concoction, though not perfect, appears in the Urine, you give a Purge on the Ague-day, so as it may have done working before the fit comes, (that is, four or five hours before you think the fit will come) you will find, the Ague will never return any more after that fit, but will be quite removed as by Incantment. I have often tried it, and in most persons the event always answered. In Tertians I doe this after the third or fourth fit, in Quotidians I tarry longer, and in Quartans longest of all, scarce before the thirtieth day.

Petrus Mo-
narius, in
Consult.
Scholtzii.

XXIV. All Physicians take the signs of Crudity and Coction from the Urine; but certainly it is a very fallacious conjecture that is taken from thence: for the cause of Agues is not in the greater Veins, in which, as also in the Reins and Bladder, Urines get their Concoction, but in the first Region of the Body: for bad Urines in Agues signifie, that much excrements creep out of the first Region of the Body into the greater Veins in the fit, which corrupt the Blood, whence a change of the Ague into a Continual fever may be feared, upon the removal of the Humour out of the first Region of the Body into the greater Veins. But they do not at all shew, how crude or concocted the humour is, which is lodged in the Mesentery, Gall, Bladder, Liver and Spleen. Now oftentimes at the second or third fit the Urine seems very much tinged, when a bilious corruption creeps out of the first Seats into the Veins, upon which many contend, that bleeding in that case is very necessary, as if the fired Blood required to be quenched with this Remedy, when notwithstan-

ding it rather points out the purging of bile by stool, and the opening of Obstructions. For neither, when Blood is taken away, is the source of the Disease purged, nor is the heat of the raging bile therein quenched. But on the contrary, unless there be a *Plethora*, which it is best to cure by emptying the larger vessels, there will be an attraction of the cholerick, excrementitious humour into them out of the first Region, upon which there is a change of an Ague into a Continual Fever. Therefore croceous and red, or crude, or otherwise bad Urines in Agues, shew, that there is so much excrementitious humour in the first ways, that a great share of it is poured into the Veins and the rest of the Body, which unless it be evacuated by repeated Purging, there is fear that an Ague may become a Continual fever, or last a long time.

Enchir. Med.
pract.

XXV. It is a received opinion among some of the Arabians, that bleeding in Agues should either be wholly omitted, or celebrated in the process of the Disease. But we know from innumerable instances, that this opinion is not so proper for curing Agues: for we have experienced by many years practice, that all they, who let Blood before the third fit in Tertians, were soon freed from their Ague-fits: but that they who used the Remedy after this time, found benefit more slowly by it. Nor is there reason wanting; for if there be a *Plethora*, which is seldom wanting in the Bodies of our Country-Men, all things are made worse by delay and neglect of Evacuation. But because in Agues all the vitious matter resides without the greater Veins (as some will have it) truly I doubt whether it agree with all things, which evidently appear in Agues.

Jac. Oerth-
us apud
Schenckium.

XXVI. It is to be observed, that we may flee to Antimonial and Mercurial Medicines in all Agues of long continuance, for as the matter lies in several places, so especially in the Mesentery, whence unless it be fetched by one of the said Medicines, you will scarce ever rightly expell it, except in a long time.

Hartman.

XXVII. It were incredible to tell, how great a power of Diseases follows for want of purging after autumnal Agues. Therefore when the Disease is cured, the Patient must be carefully purged: For whenever I found an elderly person had had a Tertian or a Quartan, and neglected Purging, I could certainly foretell, that some dangerous Disease would afterwards seize them, of which notwithstanding they did not at all dream, as if they had been perfectly cured.

Sydenham.

XXVIII. A certain Carman cured several, that had been long sick of Agues, or otherwise indisposed, by giving them a draught of Wine, wherein he had first dissolved an handful of Salt. They that drank it purged upwards and downwards with great violence. Some that had been troubled with a tedious Head-ach, and bastard Tertians, after they had had them for a long time, recovered by this means. But several others, to whom this Medicine was given unseasonably, or that were very weak, were most grievously hurt by it, yea, and some died.

Erastus,
Quæst. de
Purgat.

XXIX. Since natural sleep is nought in the beginning of Ague fits, whether may we say the same of it, caused by art? A certain friend affirms that many Agues have been removed by the help of *Laudanum Opiatum*, after due preparation and purging, with *Tartarum Vitriolatum*, Extract of Hellebore, *Antimonium Diaphoreticum*, &c. Which effect he judges, does not want its reason: For seeing, saith he, in all Agues, that continue pertinaciously, there is some putrefied infection which is left in the focus after every fit, and which ferments upon the coming of a new fit, with fluxion either through the Veins, or through the whole, it so falls out, that if the Alexipyretick *Laudanum* be given 2 or 3 hours before the coming of the fit, all the heat will be then mitigated, the fermentation of the humours stoppt, and

fluxions

Gr. Horstius,
probl. deced.
1. 245f. 6.

Abr. Scyller,
apud Schol.
tium, Ep. 3.

fluxions into all parts restrained, and so the Ague with the spreading of it wholly intercepted. Perhaps, that passage found in Petronius may be to this purpose, where Quartilla says, Truly I was so tormented that night, and shaked with cold so dangerously, that I feared a fit of a Tertian, and therefore I sought a Medicine for sleep. ¶ If the Disease retire not upon purging, I should certainly give Philonium before the fit: This will not onely be convenient to drive away a bastard Tertian, but also to assuage pain. ¶ That Hippocrates used Narcoticks in a Quartan, to check the motion of the humours, and hinder the dispersing of them, which is the proximate cause of an Ague, is evident from lib. 2. de morb. Sect. 2. vers. 206. Of Henbane seed the quantity of a Mithridate, and as much of Mandrake, and of juice of Silphium the quantity of 3 Beans in Wine, &c. ¶ Platerus gave Syrup of Poppy to one in an Ague before the fit. Obser. l. 2. p. 173.

Cautions in the use of Medicines may be taken from the Pulse. LII.

I. A Noble-man being taken with a most violent Burning fever, asked an old Woman, that was by, to bring him a Pail full of cold water, which being done, he dipt his hands into the water, and when he found that the raging of the heat was allayed and extinguished by it, he held them in longer, at length when he drew them out, a livid Blackness had disfigured both of them with privation of sense: Earnest endeavours were used to recall the native heat, but all to no purpose, for the pleasure of his refreshment he lost both his Life and Fingers. ¶ A Woman, not being able to quench the heat of a Burning fever by drinking, washed her mouth with cold water so lavishly and frequently, that no warning was sufficient to deter her from this most gratefull Cooling. But the veins and arteries of her Palate and Throat being straitned by this adventitious Cold, and the vapours inspissated, and so the Spirits that endeavoured to go to the Brain, being suppressed, her Understanding not onely failed her, but with contracted Nerves also she fell at length into inevitable Death.

II. Some hold, that we must never let blood or purge in a Fever or Loosness, though the vacuation be not proportionable to the abundance. Others say, that there is room for either Remedy, if Nature move not perfectly. Each Sect errs, departing from Galen's fundamentals: because whether Nature moves perfectly or no, it may so happen, that they may sometimes be convenient, and sometimes not: The reason is, the Indicantia may sometimes indicate more than the Prohibitentia prohibit; sometimes the Prohibitentia may prohibit more than the Indicantia do indicate. For example; Let a man be taken with a Fever and Loosness, and suppose there be danger of his strength failing, by reason of the Loosness, without doubt we must then have most regard to the strength: But if this Fever were very malignant, and the Loosness not proportionable to the abundance, then if there were any fear lest the malignity should furiously run to the Heart or Brain, with certain danger of death, then undoubtedly the furious malignity would be more urgent, than the fear of the strength's failing through the Physick or Bleeding: In which case, if it be true that we must have most regard to that which is most urgent, we must be forced to use both remedies. ¶ When a Loosness attends an Ague, many are abhorrent from Purging; but this is so far from dissuading a Purge, that it intimates it should be hastened; for it is either crude and lienterick, or choleric, or bloody: The crude persuades to drink sparingly, and requires Rheubarb, by which the crude humours being cleansed, and the Stomach strengthened, the flux will easily cease: The bloody requires likewise the use of Rheubarb, that the sharp and fretting bile, corroding the Intestines, may be purged away: a choleric one, whether it be caused symptomatically through the multitude and agitation of the humours, or by the strength of Nature forcing it, requires vacuation made

Enchir. Med. præd. made by Art, that, part of the Load being subtracted, Nature may more easily concoct the rest.

III. Prudence is necessary in stopping a Loosness, coming upon a Pestilential fever. If it be stopp'd preposterously, the Poisonous matter is kept in, casts down the strength, and destroys the Patient. We must proceed thus; If it be so moderate, that it do not spend the strength, it must not be stopp'd, but onely moderated with strengthning Clysters: If it be immoderate, and spend the strength much, it uses to be colliquative, and may be stopp'd boldly; which, half a drachm of new Treacle, or 1 or 2 grains of *Laudanum opiatum*, will do effectually. I have often observed a pernicious flux of the Belly, in which the Patient seem'd running to his destruction, to have been stopp'd, as it were in a moment, by giving powerfull Diaphoreticks in a large dose: The Poision, to wit, being expelled, which, by vellicating the Intestines and other Bowels, caus'd that wasting flux.

Riverius.

IV. A flux of the Belly, if it happen immediately upon the beginning of the Disease, seems therefore to be stopp'd, because at that time it comes rather from the violence of the Disease, than from the strength of Nature, acting regularly, hence it is necessary, that upon it trouble and loss of strength do follow; for of whatever fluxes Nature by it self is the Authour, they come not in the beginning, but after the crisis of a Disease. Therefore it is expedient to strengthen Nature, oppress'd by the violence of the Disease, with a Diet thicker than the sharpness of the Disease requires; for this must be indulg'd the Symptome. As, suppose *Socrates* were sick of a Burning fever with a Loosness, you must not keep him with Drink alone (which Diet it otherwise does require) but with supping of Creme of Ptilian, *Hippocrates* so advising, *lib. 4. de Vict. Acut.* where he treats of another Burning fever. Thus therefore it is manifest from *Hippocrates* and *Galen*, that in whatever Fevers the Belly is loose at the beginning, the Feverish persons must be kept with a thicker diet, than the acuteness of the Disease requires; for, for the most part such fluxes of the Belly happening in the beginning of a Disease, if they continue, waste and consume the Body; wherefore they are signs and effects of Colliquative Fevers.

Brudus de Viâ, Febr. c. 39.

V. They that are sick of Cholerick and Malignant Agues, especially of a double Tertian, do, upon the return of the Fit, fall into a Cholera, through the abundance of mad Cholerick matter, whose violence, if you do not stop, the Patient dies within 2 or 3 Fits. One was recovered from the jaws of Death by the help of these things; That I might prevent the next day's storm, I order'd him to be refresh'd with thick Panado's and Gelly Broths, that a check might be given to the rage of the humours the next day. I prescribed Epithemes and Electuaries of Conserve of Roses, Bugloss, Borage, preserved Myrobalanes, Pearl: But three hours before the Fit I order'd this admirable Clyster to be given, without which, if I am not mistaken, there had been an end of the Patient; Take of Red Roses 1 handfull, boil them in Broth made of a Wether's Head and Feet. In one pound of it strain'd dissolve of new Venice-Treacle 2 drachms, 1 Yelk of an Egg. Make a Clyster. Which he kept till the return of the Fit, which brought his Loosness again, but much less than it was. And by insisting on this method, I have saved several that were given over for lost.

P. Pacheco, obs. 4. in River. obs.

VI. If in the course of this Disease you find a Loosness arise, which uses to come when the opportunity of giving a Vomit is omitted; I say, in this case, it is convenient to give a Vomit at any time of the Disease (except the strength indicates the contrary) although the propensity to Vomit be long since past. But because I have done with this before, I will here subjoyn what is needfull to be

done, if, although a Vomit have been given, a Loosness do nevertheless follow: Which yet is rare; unless in a Symptomack fever, where a Vomit does not onely not hinder this Symptome, but sometime creates it. In this case this Clyster did good above any Astringents; Take of Pomegranate-rind half an ounce, Red Roses 2 Pugils, boil them in a sufficient quantity of Cow's Milk, in half a pound of it strain'd dissolve 3 drachms of *Diaecordium*. I would not perswade you to give a larger quantity, and so make the Loosness greater, which you had a mind to stop. You will object, It seems more to the purpose, especially when the Disease declines; rather to suffer a Loosness than to stop it, seeing sometimes it is critical, and puts an end to the disease. I Answer, I will not deny, but that sometimes a Fever makes way for it self, and flies out at this Port; but this happens so seldom, that our hopes should not depend upon it; And now I must add this, that the Secretion of certain parts, which is done by the excrement, is not onely necessary for the genuine depuration of the Blood; but it is required also, that other parts be separated, as Flowers, a thing which we daily see in other rich and heterogeneous Liquours. Therefore, if you indulge the Loosness too much, you will procure onely half that depuration, which is so much desired, and also that perhaps may be voided first, which should have been rejected in the last place. I confess indeed, that when this Separation by Flowers is already made (which is usually done gradually and insensibly, for the most part, by a little more ample Transpiration, rather than by manifest Sweat) a Loosness, if it should chance to come, would portend no great danger. Yet we must know, that it does not come for any other reason, but because a Purge, designed to discharge the excrements, was not administr'd in season, by which stay of theirs indeed the Excrements, having got the mode of some malignant ferment, do then irritate and stimulate the Guts to Excretion; that I may not say, that the very liquid consistency of the excrements (for they are for the most part seen in such a form) does sufficiently indicate, that they must not be esteem'd a critical solution of the Disease.

Sydenham.

VII. It will not be much out of the way, to relate the cure of a Woman, who was taken with a Burning fever, her Belly was always loose, she got no sleep, and she had an immoderate heat in her Stomach: Her stools did not extinguish the febrile heat. Some advis'd her to drink Barley-water onely; for they judg'd, the acuteness of the disease did not require a thicker Diet: Others would have it better, to bridle the violence of the disease with Medicines: Others thought, the immoderate flux of the Belly was to be stopp'd with astringents, for this reason, because the Patient found no relief from it: But indeed my opinion prevail'd, that the Loosness should neither be stopp'd by Astringents, nor that there was then any occasion for Medicines, and that they could use no remedy, that was more seasonable, than to strengthen the Patient's Nature with a thicker Diet than was suitable to the Disease; since by this means she might with less inconvenience bear the Symptome of a loose Belly. Wherefore I kept the Woman, for some days, with thick Chicken-broth tempered with convenient Herbs, and used no other remedy. So indeed she escap'd an acute disease, onely by an agreeable Diet. Whence I gathered, that in an acute Fever, with an immoderate flux of the Belly, it is the wholesomest thing for the Physician onely to take care, that he strengthen nature with a thick Diet.

Brudus de Viâ Febr.

VIII. But then it ought to be consider'd, when we must use astringent Meat and Drink. In acute Fevers we do by all means endeavour to drive the efficient cause of the disease out of the Body, and when

when any evacuation happens spontaneously, although it be made unseasonably, it must not be stopt for this reason, because it is to be suspected, that some share of the noxious superabundant humour is voided. Although we know for certain, that in these unseasonable Loosnesses, much of that which is usefull and convenient for Nature is evacuated, we must not for that reason stop the Loosness; for a greater inconvenience usually follows upon the retention of an ill humour, the Fever increasing, and its Symptoms therefore increasing, which devour the strength, than the Damage of the weakness is, which they that go the contrary way to work, might fear; Wherefore, taking care for the Fever, and its Symptoms, we provide for the strength by a thick Diet. Yet it is to be understood, that we give cooling and thick Broths onely in such a flux as is caused by Colliquative Fevers, and Drink that participates of an astringent faculty, more to withstand the Colliquation, than to stop the Flux: For it is not advisable to keep in the Body, what is already dissolved from the parts, by the violent burning of the Fever. For this reason, *Hippocrates*, when in *lib. de rat. viſſ.* he had mentioned Loosnesses in Fevers in several places, makes onely once mention of an astringent Drink and Broth, of a thick confidence; to wit, when the Belly is loose and colliquative; *It seems to me, saith he, that cooling and thick Broths should be given, and vinous Drinks, which may stop, or even more astringent ones.* But in the rest he sometimes advises to give a Purge, so far is he from perswading Men to stop those fluxes.

Idem.

IX. But we must know, that all Loosnesses come from two causes, namely, from the hurt, either of the expulsive, or of the retentive faculty. When it is caused by the irritation of the expulsive, it is not safe to stop the flux with Astringents, especially in acute Diseases: But when it comes from the weakness of the Retentive, it must be stopt with Astringent meats and drinks, in every Fever and in every Disease. Therefore in Colliquative fevers, by reason that the Colliquation argues weakness of the Retentive faculty, more than any strength or irritation of the expulsive; *Hippocrates* does not without reason order Men to give thick and cooling Broths, and Vinous and Astringent Drink, which may bind. Therefore, in what diseases soever the Belly is loose, through the weakness of the retentive faculty, we must use Astringent meat and drink in them, taking our indication rather from the Symptome than from the Disease.

Idem.

X. People in Fevers sometimes labour under a dejection of Appetite, so that their Bodies wither with an Atrophy. And seeing it has manifold causes, no Meat can simply be commended to restore it. Not onely the intemperature of the mouth of the Stomach dejects it, but also whatever humour it is, which dulls the sense of the mouth of the Stomach, or hinders the contraction of its parts. Now the Intemperature is for the most part hot, with either contrariety, dry and moist, joined with an humour, and without any. When Heat and Moisture are the Cause, Capers with Vinegar, Pickled Olives, and Broth of Lentils are good: But when Heat is joined with driness, cold Water does most good, unless something prohibit it, Lettuce, Gourds, Melons, &c. which is the reason, why in Summer-time we use them at the beginning of a Meal, that so we may repress the Heat and Driness of the Stomach, after which we find we have better Stomachs to our Victuals. The Appetite is also dejected, for want of contraction of the parts of the Stomach: This is a disposition contrary to it, which some call Remollition, or Relaxation of the Stomach; it has its rise from a phlegmatick humour, that has long hung about the Stomach, and moistened its Coats, which *Galen* mentions *m. m.* where he allows drinking of Wormwood for a Medicine for

this Ail. This Relaxation renders the superficies of the Stomach smooth, whereby it dejects the appetite; for the appetite is a Sense of some exasperating thing, or arises from it; Wherefore Wormwood may be rightly said to procure an Appetite: for by its driness it corrects a lax Stomach, by its bitterness and astringency, it makes the smooth superficies rough. Wherefore when the Appetite is decayed through relaxation of the Stomach, we must use Wormwood. Salt-fish also is very effectual to this purpose.

Sometimes also it comes to pass, that a crude humour sticking long to the Coats of the Stomach, causes Loathing: Whatever things therefore have a faculty of voiding this, and making the Stomach rough, are properly said to raise an Appetite, by reason, that for the most part Loathing of Food arises from the said cause. Among hot things, Garlick and Onions are such: for Garlick has an excretive faculty, it bites and dries the Stomach, according to *Dioscorides*: And whereas it is said that Garlick is windy, and causes Loathing, it is frivolous; for we find by daily experience, that it is no slight remedy for wind, and that it procures a Stomach, and *Galen* *de rat. viſſ.* is of the same mind. Whoever therefore have a loathsomeness to their Victuals, by reason of crude humours long sticking to the Stomach, they may with good effect use Garlick steeped in the juice of sowre Grapes, or of Sorrel. And there is likewise a cleansing faculty in Onions, according to *Dioscorides*, and they bite the Stomach, for which reason they raise an Appetite: Whoever therefore through want of exercise, or a weak expulsive faculty, have a drowsie sense in the mouth of their Stomach, and upon that occasion loath their victuals, they may beneficially use raw Onions cut into thin slices with Water, Salt and Pepper. Mustard also bruised, with Vinegar and Bread, renders the sense of the Stomach more acute. Parsley boiled with Meat, raises an appetite, without any action, that is taken from the manifest qualities: It is also admirably good, beaten with Vinegar and Bread.

Idem.

XI. One of the *Arabians* writes thus; Among those things that are good for them, who have lost their appetite through weakness, as in people upon recovery from sickness, or by reason of a moist viscous matter, this is one, to eat Olives and some Salt-fish. But as Olives are hurtfull to them, whose Bellies abound with a moist viscous humour, so is Salt-fish for people upon recovery, who loath Meat because of their weakness: for according to the opinion of that Physician, their Appetite is lost for want of blood, as (saith he) it happens to those that are upon recovery, or to those that are evacuated with a great evacuation: I think the use of Salt-fish would rather be an Inconvenience than a benefit to either, when they loath food: But neither do pickled-Olives make them any better.

Idem.

XII. To keep off the Anguish, *Aretaeus* gave washt-Bread, sprinkled with cold juice of unripe Grapes, before the Fit. ¶ But *Trallianus* his experiment seems to me something rash, who, an hour before the Fit, gave Pumpions, made very cold, to be eaten, then presently gave them store of cold Water to drink, and so frequently prevented the Fit, while some fell into a sweat, and others voided great store of choler by stool.

Fortis.

XIII. I derive the Head-ach, which is sometime very violent, during the Febrile heat, especially from a salt lixivious acrimony; hence I have observed, that it gives way chiefly to Emulsions, which are often commended by use, and which I know are very proper to temper any, but especially a Salt Acrimony: Yet here not onely Anodynes but Narcoticks also are convenient.

Sylvius de le Boë.

XIV. One had a *Hemitriticus* Ague, with a most violent Head-ach, and that a continual one, he was four times let blood in the Arms to no purpose: But

Riverius,
cent. 3. obs.
40.

But it was taken away in an hour's time, by letting blood in the right-ankle, in the end of the sixth day. Here young Practitioners may see, how good the revulsion from the head is, by opening the Saphena's.

XV. The Heart-burn is two-fold, one, which is caused by the *ichor* of the blood gathered in the Veins, when it used otherwise to be evacuated by the Hæmorrhoids; of which, *Galen* 1. *Prorrhæti*. Sect. 3. *Aph.* 38. Another, which is caused by an humour, and especially a choleric one, which he, 1 *ad Glauco.* 14. writes, is sometimes poisonous. Which division holding good, I say, that although upon the account of the Fever a Vein should be bled, nevertheless we must first abate the Heart-burn; for where it is, and it is caused by bile, there is neither an indicant nor a permissent, for it is not caused by blood, and strength is low: Moreover, there would be an attraction of the sharp humours that are in the Stomach, to the Veins, whence would come a greater mischief. But if the Heart-burn come from an *ichor* in the blood, although upon that score there be an Indicant, yet there wants a permissent: for in every Heart-burn the strength is weak, seeing there is pain, to which a dolorick quality, which is very troublesome, is joined, so that hence a cardiack *Syncope* often arises. But because the *ichor* of the blood, which used to be purged by the hæmorrhoids, is retained, therefore in a Fever with this Symptom, from such a cause, it will not be inconvenient to open the Hæmorrhoid Veins: for Blood taken away by them, weakens not so much. But when the Heart-burn ceases, and the Fever still continues, and requires breathing of a Vein, if any one ask, Whether we may let blood? I say, that if the Heart-burn, its cause being extirpated, be at an end, without doubt, upon the account of the Fever, if the strength will allow it, a Vein may be opened: But if the Heart-burn cease, and the Physician be not certain whether it may not revive again, he ought to go warily to work, and rather abstain from it, because he doubts the cause lies there still. Hence it appears, that a Physician's dexterity is requisite in this case: for although it be made use of, while the strength is good, yet the Patients, for the greater part, are afterwards destroyed, or scarce come to themselves again; the Heart-burn coming again at last, as I have often observed. But I always abstain from blood-letting, and the cure succeeds well.

Claudius
Resporf. 9.

XVI. When grievous Pains exercise the sick, when restlessness from the agitation of the humours is observed in them, prudent Physicians use to have recourse to Opiates and Narcoticks, as to their Sheet-Anchor; which is done, inasmuch as all Narcoticks and Anodynes abound in Sulphur, whose property it is to qualify every sharp, as well acid as lixivious, a thing which may be made good by infinite Medical instances. Hence it is, at least in my judgment, that Narcoticks and Opiates, Treacle, Mithridate, *Diascordium*, &c. given in the beginning of Agues, that arise from a vitious effervescency, diminish, check, and sometimes stop the violence of the Ague, which even the common people know.

Sylvius de le
Boë.

XVII. We have shewn, that Vapours and Wind may be produced by humours in the small Guts, upon the meeting of the Pancreatick juice, choler and phlegm, but more plentifully and noxiously in the beginning of Ague-fits, and when they are in the increase, yea, at the height: Although, according to these various times, various vapours and wind use to arise, according as this or that humour has the predominance, which is well known to them that attend to the complaints of the sick, and observe their circumstances often differing very much among themselves. For when the Fit begins, and the Cold is violent, the vapours that are carried up, use to be more austere, acid and glutinous, whereas they

which are every way dispersed, when the heat begins, are more subtle and furious, and increase the eruption of sweat, till the going of it off. Wherefore each of them must be discussed with a several Medicine: For whereas when the Cold begins, and as long as it lasts, Volatile Salts, and Aromatick Oils, and in particular, Oil of Cloves, are good; So when the heat is violent, Spirit of Nitre should be preferred, as well pure, as the sweet, mixt with drink, whereby at the same time, Sweat, withheld for by Aguish persons, is promoted, and ends the Disease, if it be not too much, and spend the strength. And when there is fear of such Vapours, because the like have been observed already in the preceding paroxysms, it is good, a long time before the coming of the Fit, to take a small quantity of those Medicines for correcting and discussing them, which must therefore be most proper for preventing them. By means whereof, I have observed, Patients grew always better, and by little and little overcame unexpressible Anxieties.

XVIII. So it is sometimes, that bleeding at the Nose does follow, either because over-hot Medicines have been given at the beginning of the Disease, or because the ebullition has not been sufficiently restrained, that is, either when the Patient is in the flower of his Age, or the season of the year helps towards it. If it be thus, things that are commonly used to stop the motion of the blood, will little avail. Letting of blood, Ligatures, Astringent Medicines, Agglutinants, things that temper the acrimony of the Blood, &c. For although, according to the skill and prudence of the Physician, one may use this or the other of them; yet the whole stress of the affair lies on this, to give a check to the ebullition of the Blood by some proper Medicine, which may stop and compose its violence. It is true indeed, if the Symptom may be kept apart, the means we have enumerated may be proper enough, especially Blood-letting, nor should I scruple to use them; but certainly they do not sufficiently reach (if you onely except Blood-letting) the cause of this Symptom, which indeed you can with no more reason endeavour to take away by the aforesaid things, than if you should offer to put out the fire with a Sword. Therefore in this case, when other things have been tried in vain, I am wont to use some such thing as this; Take of Water of Purlain, Red Poppy, each 1 ounce and an half, *Syrupus de Mætonio* 5 drachms, Syrup of Cowslip Flowers half an ounce. Mix them, make a draught. But I would not have these things so understood, as though I would have every Hæmorrhage thus immediately cured, because oftentimes it must rather be let alone, and it may do the Patient much good, partly by repressing too great Ebullition, and partly sometimes by critically putting an end to the disease. And indeed it will little avail to give the aforesaid check to this Symptom, before it have run out for a little time, or also before a Vein have been opened in the Arm. And we must diligently observe this, that this, and all other immoderate Hæmorrhagies have this peculiar to them, that as soon as they are in any measure stopt, unless some gentle Purge be given, there is fear that the Patient will suffer a Relapse, and therefore we must Purge, although (if the times of the Fever be considered) it uses to be given something later, and ought so, but that this Symptom happened.

Sydenham.

XIX. It often happens that Dropsies do follow, when a Man is not carefully Purged after Autumnal Agues; But they are easily cured when the disease is new, by means of Aperients and Catharticks. Nor am I concerned, when I hear and perceive that the disease arose hence: for then I conceive hopes of a good issue of the affair: for I have cured some by the use of the following Apozeme, even without mixing any thing more appropriate to the Dropsie; Take of the Root of Monk's Rheubarb

2 ounces,

2 ounces, Roots of *Asparagus*, Butcher's Broom, Parsley, and Polypody of the Oak, each 1 ounce, the middle rind of Ash, of Tamarisk each half an ounce, Leaves of Agrimony, *Ceterach*, and Maiden-hair each 1 handfull, clean *Senna* 3 ounces, besprinkled with 1 ounce and an half of the best White-wine, Trochiscs of Agarick 2 drachms, Fenil-seeds 4 scruples. Boil them in Spring-water to 1 pound and an half. In the Colature dissolve of Syrup of Cichory with Rheubarb, and *Magistralis ad Melancholiam* 1 ounce and an half. The Dose half a pound, every morning for three days; And let it be repeated as often as there shall be occasion.

Idem,

XX. Blackness and driness of Tongue is a frequent Symptom of Burning fevers, with a violent inflammation; because, that an immoderate febrile heat, together with sharp vapours, exhales, and is most readily received into the spongy substance of the Tongue, on which, defluxions concurring, it brings roughness and blackness. They of *Austria* and *Hungary*, where such Symptoms of the Jaws do very often occur, by reason of the frequency of most violent Burning fevers, dissolve Trochiscs of Nitre, prepared with Flowers of Sulphur, in water, as a singular and specific remedy, which they do not only drink plentifully, to quench the febrile heat; but they use it also in form of a Gargarism, to correct the roughness and blackness of the Tongue, not because of a certain Elementary frigidity, coagulating things heterogeneous with homogeneous, which cannot be supposed in this place; but because of an Armoniack and Vitriolate Acidity, which is able to dissolve Bodies, and restrain and coagulate the ferocious Spirits, which may easily be demonstrated from the preparation of *Mercury*, and other changes of natural things. The vulgar preparation of *Sal Prunelle* with Sulphur (as *S. Clossius* observes) may suffice for the *Prunella*, and other outward Ails: but it is not so good for inward uses and Burning fevers, contrary to their opinion, who contend, that Salt-petre is then finely prepared for Medicine, that is, if it be burnt four times at least with Sulphur, and as often filtered and coagulated: For they say, there are crude Spirits in it, which, unless they exhale, and be dissipated, will do no small harm to the Stomach. But these Men do not take notice, that the whole substance of the Petre-Stone abounds with these firm and pontick Spirits, which, if they call crude, I will not much gainsay them: But they are so far from being corrected by this detonation, that the parts more subtle, and fitter for cooling, fly away with the Sulphur into the Air, and if this conflagration last long, nothing else at length will remain, but a bitter, fixt and porous Salt, endued with a heating and drying quality, a thing which it will not be difficult for them to divine, who have learned to get out the Spirit of this Chymical *Cerberus* by injection of Particles of Sulphur. Therefore all the skill lies in purging of this Salt, and in the right way of giving of it. Take therefore a sufficient quantity of the purest Salt-Petre, melt it in a crucible in a moderate fire: Afterwards cast it into a good quantity of common Barber's Ly (but however let it be hot, otherwise it would sile in your face) let it dissolve in it, filtre and evaporate it half away; then set it in a cold place, and most pure Crystals will be gathered at the bottom, which in goodness and fineness far excell the second and third that will follow; separate them, and then dissolve them in Rose-water: On the other hand also, dissolve as much Sugar in some Cordial-water, or in the same; mix these Solutions, and boil them according to Art, that the Crystals may be gathered in a Cellar, the use of which will be about half a drachm, or 2 scruples in Ptisan, or Pectoral Decoction, for so they escape the sense of the Palate. Otherwise, if you give Mineral Crystal in distilled-waters, you will find an Urinous and

biting Taste, which will create trouble to the Stomach. G. Hortius in Prob.

XXI. I never advised any one to Bleed under the Tongue, though Barber-Chirurgeons sometimes persuade to it. And what this can doe, especially when there is no Quinsy, but onely the Tongue rough and black, through heat in the Bowels, I do not see. Let the heat in the Bowels be taken away, this Symptom will easily cease. Sennertus, Ep. 28. cent. 1. Yet *Franc. de le Boë Sylvius* admits it. *Prax. l. 1. c. 30.* A Fever, saith he, accompanied with a purple-black colour, and a dry heat in the Tongue and Jaws, will be cured, if besides univerials, convenient for such a high Burning fever, those things in particular be used, which have been observed to doe good to this heat, driness and ill colour of the parts of the mouth, among which Gargarisms are especially commended, of a decoction of Self-heal (which had its name *Prunella*, as they say, from curing this disease, which is called by the same name.) Opening the Veins under the Tongue is good also, and especially when they are observed to swell, and yield some sign of a Quinsy at hand, or there already: for it is no new thing for a Quinsy to be joined with this Symptom.

XXII. Cold water is a thing, which conquers thirst most of all others. In the second place is Barley-water: In the third is Syrup of Violets diluted with store of Water. Our Moderns often use Water and Sugar: But we ought diligently to consider, that we may not use it, nor any Absterfive, in an exceeding driness of the Tongue, or of the whole Body; for such things make the Body drier, as experience hath formerly taught me. In *England* I visited a *Spanish* Boy of a thin and exceeding squalid habit of Body. His Tongue was beyond measure rough and dry, so that he could scarce speak, and he had an insatiable thirst. I thought good to give this Boy cold water, and I put some Sugar in it, to correct the grossness of the water: And when his thirst was not abated by drinking cold water, I attributing it to the fault of the water, gave him distilled Bugloss-water, because there could be nothing gross in it, with Sugar; and when upon plentiful and frequent drinking of it, he still grew drier, at length I understood, that in an exceeding driness, things which have an absterfive faculty, are not proper, because they render the body and humours drier. For to make use of absterfives onely, is just as if you should laboriously rub foul Linen with Soap without Water, to get the dirt out; for the more Soap you use, the less good you will doe, and you will onely rub the filth more in; for you should first steep your Linen in Water, that the filth, which you would get out, may be moistened: So Women first suffer their Linen to be steeped long in Water, use shewing them the way. When therefore Mens bodies are very much parched, Abstergents must be avoided, for then the humours are not to be cleansed, but rather to be moistened; yet when you have made them moist enough, you may securely use Absterfives, as *Hippocrates*, lib. 1. de *vict. Acut. instruit* us; The quantity of Broth to be given must be observed in this manner, to wit, if the Disease be drier than one would think, we must not give much, but give Water and Honey, or Wine before the Broth, as shall be most convenient. *Galen*, in his Exposition, recounting the signs, by which we may know a dry Disease, writes thus; And truly, saith *Brudus de* he, to void none of the Superfluities, is a sign of a dry Disease: Therefore *Hippocrates* does not without reason order vict. Febr. c. 28. some moistning thing to be taken before Ptisan.

XXIII. And not onely Abstergents must be avoided in such a Disposition, but also all manner of Meat and Broth. For we must use onely moistning drink for them, whose Tongue and whole Body are beyond measure dry. Because if you should give them Broth, part of the Broth, which is of a thicker substance, sticking to the coats of the Stomach,

mach, because of their exceeding driness, would be rather burnt by the febrile heat, than concocted; just as Meat sticking to the pot is burnt, when it wants moisture. And this was Hippocrates his mind in the place before quoted; where he orders Patients to drink Honey and Water; or Wine before their Broth; when the Disease is beyond measure dry. Meaning, that in such a Disease, the Sick must be first nourished with moistning Drink; till the driness be over; and then they may proceed to Broths.

Idem.

XXIV. But I know this for certain, that the driness which comes upon the Tongue, and the whole Body from the quality of Burning Choler, is much stronger than that which proceeds onely from the thickness of the humours. Wherefore it was well remembered above (Paragraph. XXII.) that Water and Sugar must be avoided; and all Abstersives; and that moistning Drink must onely be used.

Idem.

XXV. It happens sometimes, especially in old Men, when the Fever is cured, and the Body has been sufficiently purged; that the Patient notwithstanding is very weak; and expectorates great store of glutinous and viscous Phlegm; sometimes by coughing, and sometimes by hawking: Which Symptome not onely strikes terror into the Patient, but has imposed on the Physician also; especially the less wary, and made him believe, as if this affection were the fore-runner of a Consumption, although I have observed the thing is not so dangerous. In this also I order the Patient to drink old Malaga, Canary or Muscadell Wine with a Taste, which strengthens the Crasis of the blood; much weakened with the foregoing astuation (and therefore unable to assimilate the Juice of what is lately taken) and it drives away this Symptome in a very few days time, as I have found by frequent experience.

Sydenham.

XXVI. If the Patient, either by taking hot Medicines either unsuccessfully or unseasonably, or being of too hot a Constitution by nature, fall into a Phrensie, we must look back to the Disease and Symptome, which may be done by giving some Narcotick in a larger Dose: For although when the Fever is strong, things that have a narcotick faculty be not altogether so proper, and do not obtain the end the Physician drives at, yet given seasonably and in the declension of the Disease, they yield excellent Effects; but, before, they can doe no good; partly, because they cannot stop the fermentation running on with violence and impetuosity, though given in never so great a Dose; and partly, because by using this Medicine, a stay is given to the peccant matter, at that time equably mixt with the mass of blood, and not as then inclining towards separation, and then Depuration, so much desired, is hindered. And therefore I declare it as a thing most certain, that Laudanum, or any other Narcoticks, given to ease this Symptome, either in the beginning, increase or state of the Disease, either doe no good at all, or, as it often falls out, doe much harm; but if they be given but in a moderate Dose in the declension of the same Disease, they have good success. Once indeed I gave a Narcotick on the twelfth day of the Disease, and not in vain; but sooner I never knew it given with success. But if you defer the giving it till the fourteenth day, it will doe the more good, because separation is then perfectly made. Nor does this delay, although perhaps this Symptome may terrifie the By-standers, cause sudden Death: for I have often observed; that this thing may and usually does give truce, till it may be seasonable to proceed to Narcoticks, at least, if care be taken, that the Intemperature begun be not farther inflamed by giving Cordials and hot Medicines, in which case the Patients suddenly dye.

Sydenham.

XXVII. Here I would add this; if this Symptome would give so long truce, as that a Man might conveniently be purged before he take the Narcotick; this Medicine would yield so much the better effect. Wherefore I use to prescribe 2 scruples of *Pilul. Cochiar. maj.* dissolved in Betony-water; about ten or twelve hours before I give the Narcotick. Nor need we fear the tumult which this hot mass of Pills usually raises, for the virtue of the following Narcotick will make amends for that disturbance; and will cause most sweet and kindly Rest.

Idem.

XXVIII. As D. D. Ol. Borrichius did plainly remove an exquisite Tertian with Bottles full of hot water, placed round about the Body, which caused Sweat: So in the year 1674. I cured the Wife of N. of the same Symptome, when she was taken, in the first month of her being with Child, with an unusual Shivering and Cold all over her Body, and was much weakened thereby, by putting a bottle full of hot water under the soles of her feet; the sweating plentifully after it.

Simon Schol. zius, in m. c. an. 1676. obs. 140.

XXIX. Some set them, that are afflicted with a violent cold fit at the beginning, in a Bath, in which also hot Herbs have been boiled. But lest some error should be committed in it, or that the hot fit should grow stronger, certainly it were most convenient to foment the Stomach and Heart with a warm Decoction of hot Herbs, as Mint, Wormwood, Rue, Wild-marjoram, Chamæmil and Dill, with Anise and Fenil seeds. The beginning of the Fever being made hot, the Shaking is often discussed, and the state of the *Præcordia* is much better.

Fernelius.

XXX. I have often observed, that the Hickup arises from the disturbance and tumult raised by churlish Medicines in the Stomach and parts adjoining: For the stopping and reducing of which to their ancient peace, when the strength of Nature is not sufficient; there is great danger imminent. Therefore we must so direct our Cure, that what Nature of her self could not accomplish, Art may: And, by giving a large dose of *Diaferdium*, that is, 2. drachms; with Dill-seed and other Specifics, I never failed of my intention.

Sydenham.

XXXI. An Hickup in Fevers sometimes follows the intemperate use of cooling Juleps; as I have seen several in this condition, through the unadvised rashness of Physicians. And I took away this Symptome, contrary to the opinion of them all, by Lemnisc drinking of Wine.

Lemnius.

XXXII. Our Country Physicians deserve to be chid, who macerate People sick of Fevers with unseasonable thirst: for they destroy not a few with vain enduring of thirst. ¶ Some observe the same rule in all feverish persons; namely, they industriously abstain from drinking of cold water; for which reason, in the year 1649. an infinite number almost of sick persons was destroyed: When notwithstanding, the Fevers were continual; with a mixture of divers humours, and especially of Choler, yet not alone. When Men were tormented with the greatest thirst, they died parched up. When the dead bodies were dissected, the Stomach, Heart, Lungs and other inward parts appeared as it were burnt; wherefore we restored our miserable Patients to their health by cooling and moistning them.

Langius, l. 1. Epist. 20.

Patriolus, l. 1. Penec. 4. obs. 8.

XXXIII. We must not omit, that Thirst may sometime proceed from the Stomach, sometimes from the Liver, or the Lungs, or Kidneys; as Galen, in *lib. de loc. affectib.* writes. That which has its rise from the Lungs is quenched with Barley-water and Syrup of Violets; from the Liver, with cold distilled Waters; from the Stomach, with drinking cold Water; from the Kidneys, it is cooled with a Decoction of Liquorice.

Bridles.

XXXIV. Many People give their Patients, who are well nigh dead with Thirst, abundance of things preserved in Sugar, as Conserves of the sower of Citron, Jujubes, which though without

A 2

Sugar

Sugar they may perhaps quench thirst; yet mixt with Sugar, it is impossible they should take away thirst. Women see, and Children know, that Sugar increases thirst. It were better to take nothing at all, because if the Tongue were not made foul with these sweet things, it would for several hours time be troubled with less thirst. ¶ Industrious abstain from Syrups and Conserve in all Fevers, for Sugar easily turning into Choler, fewel is given to the Fever.

Sanctorius.

Heer, obs. 22.

XXXV. In a fit of an Ague, when the cold fit is over, Patients should not be kept so much from Drink as they usually are, seeing, as *Fernelius* and *Joubertus* testifie, if the Patient, who is burnt up with heat and very thirsty, suffer thirst for any time, and so his Burning be not helped, so much the more easily a Colliquation of his body will follow, while the Heat seizes and wasts the solid parts of the body; And Sweat also, which takes its matter from Drink, is by this means hindred, which might have been promoted by cold and plentiful drinking.

Platerus.

XXXVI. There are four sorts of Drink, of which *Hippocrates* treats, *lib. de viſc. Aent.* Barley-water, Water and Honey, Wine, Vinegar and Honey. In a dry Disease he neither makes mention of *Oxymel* nor Barley-water; not of the first, because an over cutting thing is not proper for a dry Disease; not of the latter, because it being drink, nourishes but little, because of its thinness. But he mentions Honey and Water, and Wine, as things that nourish and moisten. And he leaves the choice of either to the Physician, as if he apprehended, that sometimes in a dry Disease one of them might do hurt, and the other might do good: for if a dry Disease come from a cholerick humour, by reason of its furious quality. Water and Honey must be avoided by all means, and Wine must be given, because it moistens and administers strength to Nature, with an Absterſion or Incision. But if a dry Disease come from an over thick humour, that resists the concoctive faculty, Water and Honey must be rather given than Wine; as well to extenuate the grossness of the humour, as to moisten the Body; for Water and Honey moistens more than Vinegar and Honey.

Brudus.

XXXVII. In Fevers which have their original from a hot Cause, without a mixture of Phlegm, especially in Summer time, the use of common Water is to be chosen. But it must not be concealed, that wherever we desire concoction of a crude humour, of a phlegmatick kind, Drink of distilled Water does more harm, than that of natural Water. The former indeed, if it be given cold, cools on a double account, actually and potentially: Besides, it pierces more into the inner parts of the body, upon the account of its fiery quality. Whence it is manifest, that the innate heat suffers more from this sort of Waters, than from what is natural. Wherefore in a cold Cause, and in those that labour under a Weakness of any of their inward parts, I think, distilled Waters should be avoided.

Idem.

XXXVIII. Since natural Sleep in the beginning of an Ague fit is hurtfull, it is queried, Whether we must think the same of it caused by Art? (*See Agues in general, Paragr. XXIX.*)

XXXIX. Sleep in the beginning of a fit may seem proper to some, because it is a refresher of Mens bodies and a renewer of strength: for it is said to be the Authour of good digestion. But at the very time of the fit more intense and stouter strength is required, because at that time, when the peccant matter is moved, it must be attenuated, dissolved and dissolved, that it being at last by this means consumed, the end of the fit may the sooner follow. But the Negative should rather be held, for Men should be waking in the very fit, because the blood and spirits, and therefore the innate heat, in Sleep move inwards, yet this motion is contrary

to that whereby the natural virtue endeavours to discuss the matter in the fit, and remove it outwards: For the Heat, concentrated in Sleep, may make the inward effervescency of the Humours greater and so the Fever more violent. Yet, when the fit is ended, Sleep is not disallowed, when afterwards it egregiously relieves the strength, weakened by the battle betwixt the Disease and Nature.

Horſius.

XL. If a Physician be consulted, whether it be expedient for a sick Man, who begins to sweat, to be covered with clothes, and sweat quiet? or, on the contrary, whether he should not hinder sweating by fanning and motion? And considering the Sweat is hot, and that it begins to run from the whole body, and is yet doubtfull, as it is, of the beginning of the Disease, and of the day, and the Disease be not known, let him bid the Patient keep himself quiet, neither laying on more, nor taking away any clothes, and let him sweat a while. When he is dubious, he must visit the Patient again, and observe whether he be very restless? or, whether he begin to breathe hard? or, whether the Pulse be a little languid? If any such thing follow, let him order him to be removed and fanned with a fan. If none of these things appear, and he say that he is rather relieved than oppressed, let him proceed not only one or two but several hours, taking in the mean time, if the business be protracted long, some Broth for his refection. If, on the contrary, he be not only restless, and his Pulse argue weakness, but he faint also, or look thin in the Face, he must not only prevent it by fanning, but also anoint the body with some Astringent, as, with Oil of Myrtle, throwing on Powder of Mirtle and Pomegranate-flowers, &c. And the signs of a spending and fainting Sweat are said, and lastly, for it to be cold, and to gather in great drops about his Forehead and Neck, for his Eyes to be hollow, his Face and Nails livid: When these things appear, Fainting and Death is not afar off.

Valleſius.

XLI. It frequently happened, that they who were upon the recovery from Fevers, they especially whom the Fever had macerated a long time and had not left them till after long and plenteous evacuation (especially if they were of a weakly habit of body) it happened, I say, that they, as soon as they began to be warm in bed, were presently all over in a Sweat, whereby some were grievously weakened, and recovered their strength but slowly, and others were cast into a Consumption. Because I thought this could arise from nothing else but the blood, being so far depauperated and weakened by the contumacy of the Disease, that it could not assimilate, with Juices, which were newly brought to it, it endeavoured to cast them off by Sweat; I always persuaded them that were thus affected, to take three or four spoonfulls of old Malaga-wine, by the use of which their strength returned ever, and their Sweats vanished.

Sydenham.

XLII. In Autumn, 1675. dysenterick stools came upon an epidemick Fever, and sometimes a *Diarrhea*. I presently perceived they were symptomatick to this Fever, and not, as in some Constitutions, original and primarily arising. Which notwithstanding, seeing the cause of the Disease was included in the mass of blood, it did indicate blood-letting, which indeed, giving a Narcotick twice after it, was sufficient to conquer this Symptom.

Idem.

XLIII. It often happens that the Patient is vexed through the whole course of the Fever with a troublesome Cough, that is, the tumultuous mass of blood being evidently moved, and all things now looking towards a Sedition, it so falls out, that some loose and diffuent humours are carried out of the mass of blood through the Vessels of the Lungs, or, by *diapedesis*, into the inner membrane of the Windpipe, which is very tender, and ended with an exquisite sense. Hence a Cough comes, which at first is dry, because the matter being thin escapes the

the expulsive faculty, then it grows thick and becomes difficult to expectorate; and, because it is by degrees baked, hence it comes to pass, that the Patient is struck with fear of strangling, because he wants strength to raise the viscid matter: In this Ail I seldom use any other Medicine but Oil of sweet Almonds new drawn, unless it so happen that the Patient loath Oil, for then I endeavour to give ease by common Pectorals. And I prefer it before all other Medicines for a Cough, because since it is necessary to give these more liberally and in a larger quantity, if we will do any good, by this means we load the Stomach, which is weak already and inclined to reach; by the same means also we are sometimes hindered, that we cannot do other things which should be done at that very time. Neither do I apprehend, nor am I convinced by experience, why we should be so afraid of the use of this Oil, for grant it be in its own nature hot and inflammable, yet this heat is not so much, that it may not be abundantly compensated another way, for above all things it conduces to the Breast by a manifest virtue, it both opens and smooths the passages, and so promotes expectoration, whereby (especially if it come plentifully) the blood is both discharged of a troublesome humour, being now commodiously voided, and by the same means it is a little cooled; and therefore I am not much concerned when I see this Symptom intervene, by benefit whereof no small benefit accrues to the Patient. Onely I would warn you of one thing, that it is not safe at one and the same time to give this Oil by whole spoonfulls, for there is danger, lest we bring a Loathing upon the Stomach, and a Looseness upon the Guts. We must give it therefore sparingly but frequently, by day and night, to the end that we may not onely ease the Cough by causing expectoration, but also that we may a little comfort the Patient's wasted strength by a kindly nutriment.

XLIV. Singular respect and care must be had of the Stomach in Agues: for sometimes it is weakened beyond measure, so that Crudity arising from thence yields new matter to the Ague. Then the best way is, as Sennertus testifies, to evacuate what is crude of the aliment in the Stomach and first ways by Vomit twice a week: By which Remedy the toughest Agues are more successfully removed, than by any other Remedy. Notwithstanding that the Spleen is reckoned the Seat of a Quartan, and the Liver of a Tertian Ague. For so both the matter near these parts is evacuated, and the parts themselves are freed from cacochymie. Hence it is that the Vulgar now and then cure putrid Fevers by taking of adust Wine, Pepper, &c. all which things yield fewel to the Fever; yet they comfort the Stomach and waste Crudities.

XLV. In a putrid Fever troubles and disorders about the Stomach and first ways use to annoy Men through the whole course of the Disease, such as Loathing, Vomit, Want of appetite, Incoction, Loosness, Roughness of the mouth and tongue, and a Bitter taste. These things are attributed for the most part to the humours first gathered in the Stomach, and putrefying there, but farthermore, because the recrements of the Chyle are burnt up with too much heat, they degenerate into noxious matter. Such Accidents often happen, because the purging and filth of the blood and nervous juice, while they ferment, are carried inward, and being left between the membranes of the Bowels, they cause Convulsions, and also make a mass of ill and noisome humours. I have often observed about the beginning of Fevers, that the effervescent blood discharged its recrements inwards, to the great benefit of the Patient, when, although great troubles about the first ways did accrue, yet the effervescence was therefore milder, the Pulse moderate, and the Urine laudable, and they that had their Fevers in this man-

ner, did with a thin Diet and the use of gentle Purges recover in a short time: But if in this case I used a violent Purge to extirpate the humours, this natural purging of the blood being hindered, the Fever presently grew high, with a red and troubled Urine, high Pulse, Watching, and other horrible Symptoms. Also often after the state of the Disease, the adust and excrementitious matter is separated by this inward lustration from the blood. Hence sometimes a *Diarrhœa*, sometimes a crusty plaster of the mouth and throat succeeds; wherefore there is need of caution about the accidents which happen in the first ways, lest while we prevent them, we pervert Nature's motion: And while we guard these parts against the incursion of the morbid matter, lest we unhappily keep the same blockt up in the mass of blood.

XLVI. As I have several times, so once I observed, that Narcoticks given to two persons in a Fever within the fifth day, through the Physician's fault, turn'd Necroticks, who being laid in a long lasting Sleep went to their everlasting Rest. ¶ It is good in Fevers to wash the Privities and Ears, because these nervous parts being cooled and moistened, communicate to the Brain. For as Lime, when it is moistned, fumes, so these parts dried and parched with the heat of the Fever, fume out a gentle and benign Vapour, whereby Sleep is procured.

XLVII. But if Watching continue after the Fever, other Symptoms ceasing, I have observed, that a Linen-cloth dipt in Rose-water, and applied cold to the Forehead and Temples, has done more good than any Narcoticks.

XLVIII. These Symptoms especially torment People in Fevers, Pain, Watching and immoderate Evacuations. There are divers Matters which answer the Indications; but the laudable Medicine of *Opium* carries away the prize from all the rest, in which if the just dose and proper season be observed, no error can be committed. But if either of these be missed, it may so happen, that the last debility must be imputed to it. ¶ In continual Fevers, when the strength is almost spent with Watching and Restlessness, I remember, I often rightly proceeded to the use of *Laudanum Opium*, A young Man is my Witness, who being given over by reason of the lowness of his strength, recovered his former health, Sleep being provoked by this means, the Spirits being dissipated, that did the violence, and others recollected in their room.

XLIX. Vomiting does sometimes so torment People taken with a malignant Fever, that whatever is given them, they immediately throw it up again. And although they be troubled with thirst, and dryness, and blackness of Tongue; yet they can bear no sort of potent matter, but they presently vomit up all manner of Juleps, Emulsions, Ptilians, and even simple Water, as soon as they are taken. This most grievous Symptom is immediately cured to a miracle, by taking a drachm of the Salt of Wormwood in a spoonfull of fresh Juice of Lemon, as I have learned by experience.

L. A certain Person was sick of a slight Tertian; in the fit he was so troubled with vomiting, that he swooned at the very thought of it. I gave him above half a scruple of Pills of Aloes in a Dose, two hours before his fit, they did their office by gently purging him in the fit, so that he was well in a short time.

LI. It is manifest from *Hippocrates*, 1. de rat. vict. who granted Water to one in a Pleurisie, when he was very thirsty, that when Symptoms arise to that height as to add to the Disease, or waste Nature's strength, the Indication for Diet should rather be taken from them: Nevertheless we must do our endeavour to give such things, as may, if possible, be proper for the Disease, or at least not inconvenient. For *Hippocrates*, in the place forequoted, has

Riverius.

Rolfinectius.

this passage; But when any Pain torments, you must give Oxymel to drink, in the Winter hot, in Summer cold: And if his thirst be very great, he must use Honey and Wine and Water. Reason tells us the very same thing, that the Intention of Cure must not be changed for every violence of the Symptoms; but for that which is considerable: for since Symptoms are the effects of Diseases, by taking away their cause they vanish; but if they be considerable, they give the stronger Indication for Cure. And their greatness is to be defined, when they are the cause of some preternatural disposition, which either adds to the Disease, or wastes the strength of Nature. Whichsoever of these things happens to be the cause of the greatness of a Symptom, the Symptoms may justly then supply the course of Diet and Indication for Cure: As, to a pleuritick Person, who is a little thirsty, you must give Oxymel, or Melicrate, which of them the Disease shall require: But if he be troubled with violent thirst, you shall not use such things as respect the Disease and its Cause, but such as lay thirst; for much thirst dries the spittle, and makes the Disease difficult of coction, and increases the heat of the Fever; wherefore we must give Melicrate and Water, taking the Indication from the Symptom, for Water should not be given for the Disease sake, by reason it is an enemy to the maturation of the Grief. Thus therefore the greatness of Symptoms must be defined, so as the method of Cure and indications of Diet may be taken from them. But when such Symptoms arrive at the said greatness, that is, are instead of a Cause in reference to the Disease, they are either as an urgent Cause, or, *Sine qua non*, the Disease cannot be cured; Wherefore the Indication is stronger, which is taken from them, than from the Disease, as may be gathered from the doctrine of complicated Affections.

Brutus, de
Vidua Febr.
l. 3. c. 27.

LII. In giving of Medicines, Cautions and Rules of no small moment are taken from the Pulse. Purging and Vomiting are prohibited by an over quick and violent Pulse, and also by a very low one; for while the blood is too effervescent, evacuation is not very proper, both because what is noxious is not voided, and also because the strength is much weakened by the perturbation: And when the Spirits are broken, and the strength is low, Physick casts it lower, and sometimes rather destroys it. Wherefore, when a Physician designs evacuation upwards or downwards, let him first feel the Pulse, and let him attempt these motions only when Nature is strong and sedate, that she may be able to attend the operation of the Medicine, and to support the Patient's strength. Nor is there need of less circumspection for Diaphoreticks and Cordials, which if they be used in the Fever fit they too much increase the violent motion of the Heart, and very often break its strength: Also when the Pulse is very languid, if hot and strong Cordials be used, Life may easily be extinguished (as when a little flame is quite put out by a strong blast) wherefore it is a vulgar observation, that Cordials often hasten Death, for that, in putting the blood into too great a motion, they sooner waste its strength. And yet there is need of the greatest Caution, and direction of the Pulse, in giving Narcoticks, for they, (because they do their work by extinguishing and fixing the vital Spirits, when they are over active) if they be used in a weak or faltering Pulse, they either render the Spirits too weak for the Disease by diminishing them, or they bring a perpetual Sleep by too much suffocating them. Wherefore in a languid, unequal, or formicating Pulse, Opiates should be avoided, as you would avoid a Snake or a Toad.

Willis, de
Febr. c. 10.

Febris Alba seu Amatoria, *The White or Love Fever.*

(See *The Green-sickness*, Book III.)

Its Description and Cure.

Hippocrates, in his Book *de Virginitate morbis*, calls this the *Wandering Fever*, some have named it the *White Jaundice*: For several Symptoms give intimation of a white and cold humour; seeing first of all the *menstrua* being stopt, in time of youth, in a hot and moist constitution, have caused a coldness in the whole body by suffocating the innate heat, obstructions in the Mesentery and Womb concurring not a little thereunto, and it may be in the hollow of the Liver, which hindring the ventilation of the natural Heat, increase the suffocation of it, upon which many Symptoms testify a cold Intemperature.

The primitive Cause of this Maiden Disease, was the intense Meditation of this Virgin, in which the innate Heat and Spirits being diverted from the Stomach, Crudities were bred, the original of Obstructions in the lacteal and mesenterick Veins, whence arose a hypocondriack Indisposition, and complaints of Illness at the Stomach, and rumbling of the *hypocondria*: Moreover the mass of blood was infected, which being made thick, and not having free passage through the Veins of the Womb at set times, but settling in them, has gathered obstructions in the Womb also, and made the monthly purgation less; which being increased, a perfect suppression of them followed. For the blood not having an efflux (saith Hippocrates, lib. *de Virginitate morbis*) through the quantity, it rebounds to the Heart and Diaphragm; and when these places are filled, the Heart becomes foolish, then from fatuity comes torpidness, then after torpidness a delirium takes them; as when a man has sate a long time, the blood being depressed out of the Hips and Thighs into the Legs and Feet, causes a numbness; and after the numbness the Feet are unable to walk, till the blood return to it self, &c. And it returns very quickly, for it soon flows back because of the rectitude of the Veins, and it is not a dangerous place of the body; but it flows back slowly from the Heart and Diaphragm; for the Veins are crooked, and the place is dangerous, and apt for a delirium and Madness, by reason these parts are replete, and a Shivering with a Fever takes them, which they call *Wandering Fevers*. And these things being thus, she is mad, because the heat is increased, and she is timorous and afraid, because of Darknes; she suffers strangling and prefocation, because of compression about the Heart; her mind being sad and anxious, because of the badness of the blood, draws on mischief. And I add, that the whole body is not onely cacoehymick, but moreover rendered cachectick, as appears from the vitiated colour of the whole, languishing of the Strength, swelling of the Eye-lids and Feet.

But Hippocrates seems to intimate that it is possible this Disease may come not onely from the stopping of the *Menstrua*, but from the retention of the Seed; when he asserts that Virgins are cured, when either they lye with a man, or their *Menfes* come; especially if the Virgins be of a hot and moist complexion and of a good habit.

That the Patient may be rid of this Fever, it is necessary that the mass of blood be purified, and be reduced to a more laudable state: Therefore, First, The cleansing of the Stomach and first ways must be premised. Secondly, The Obstructions of the Mesentery and Lacteal Veins must be opened. Thirdly, The Cacoehymic of the whole venous kind must be taken away. Fourthly, The Cachexy, that is beginning must be provided against. Fifthly, The *Menstrua* must be solicited by opening Hystricks. And, lastly, The Bowels must be strengthened.

As

As question cannot be made concerning Blood-letting, since it offends in quantity, substance and motion; so we must act with caution in the present case concerning the quantity; for the blood is already degenerated into a Cacochymy: and although Hippocrates teach, that the cure of this Disease is taking away Blood, yet he orders this to be done before the whole Body be Cacochymick, and while as yet it is not altogether so Cachectick. Wherefore in a tedious and confirmed oppression he, 1. de morb. mal. 10. purges the belly upwards and downwards, because a Cacochymy is not taken away by bleeding, but by purging. Hence after a copious Diarrhea a Maid, 4. Epidem. recovered. The place must be the right jecorary Vein, that Blood may be drawn, but not drawn downwards, before the obstructions of the Womb be opened, and the Veins be made pervious; for then the Saphaga may be opened, only upon the account of the Blood's motion. In the mean time an Issue must be made in the Hip.

For emptying the Stomach, a Potion with Manna clarified, or Lenitive Electuary with Tartar. For the preparation of the first ways, Ozymel simplex, with Mel Rosarum simplex, of each 1 ounce and an half, Cinnamon Water half an ounce. Mix them for one Syrup, and so for five more, then let either of the said Medicines be repeated.

Then the obstructions of the Mesentery and Laeal Veins must be cured with attenuants, aperients, and evacuators. A preparative may be thus made: Take of juice of Cichory clarified 2 ounces, Juice of Borage 1 ounce, Tartarum vitriolatum 10 grains, Decoction of Cichory, Borage, Endive, Cinquefoil, Parsley, Agrimony, 5 ounces. Mix them for a Syrup: To which may be premised about 2 ounces of dilute Ozymel, in which she may continue ten days, and about the middle of the time let this be given her; Take of Pilul. de tribus cum rhab. de Hiera cum Agaric. each 2 scruples, Electuary Lenitive six drachms; mix them. Make a Bolus. And when ten days are over, Take of Elect. Cathol. 4 drachms, Rosat. Mesues 2 drachms, Pilul. de tribus one drachm; mix them. Make a Bolus. Upon which, when an hour is over, let her drink Broth altered with Barley, or Barley-water.

The Cacochymy must be taken from the Blood by Epicrasis, by preparation and frequent purging. Nor must the little Fever be feared; for in this case we must ply the Cause, making very small reckoning of the Fever. And we must insist 12 days on the preparation, but a Purge must be given every fourth day; Take of Decoct. Epith. Mesues 6 ounces, or if she had rather have a Bolus, Take of Extr. Sennae 1 drachm, black Hellebore half a drachm, Lenitive Electuary half an ounce; mix them. Make a Bolus. Upon which let her drink clarified Whey, because Hellebore has in it a very hot quality.

When these three Purges are taken, we must not believe, the whole venous kind is defecated from impurities; wherefore Purges must be repeated, which have also an opening faculty, they must be prescribed in form of a Syrup, 2 ounces of which must be given every day in half a Glass of White-Wine, persisting in the use of it for twenty days.

Then we should take care of the Cachexy; and things that purify the fleshy parts, and defend them from ill humours, should be given, that is, Diaphoreticks, sensible Evacuators, and insensible Digestives. To which intention sweat might give satisfaction, some convenient Decoction premised, or the continued use of Viper Powder: But because our chief intention ought to be, to open the Veins of the Womb, to provoke the Menstrua, and purge the whole Body by those ways that are proper and usual to Nature; therefore lest the humours should be diverted from the Centre to the Circumference, setting aside the Intention, we must first make use of

aperient Hystericks, and things that provoke the Menfes.

For the opening stubborn obstructions of the Womb, the use of Steel is usually extolled by all men, especially of potabilis M.D. whose virtue, that it may come to the Womb, wants a vehicle. Therefore let a decoction be made, which may have the faculty to do that, and to dry the whole body; Take of the best Sarsa 1 ounce, fat Guaiacum, root of Gentian, wood of Sassafras, each half an ounce, distilled water of Cichory, Maiden-hair, Motherwort, each 1 pound; mix them; make an infusion for 24 hours. Then let them boil to the consumption of half. Keep the Colature for 2 doses, to be given early in the morning, to which 10 drops Chalyb. Pot. M.D. may be added, and a spoonfull of Savine-water, or 5 drops of its Oil.

Also the opening of the Veins must be procured outwardly, not by Pessaries, or Injections, but by things applied outwardly, by making a fomentation, and applying it with a large Sponge to the Region of the Womb: anointing afterwards with Oleum Lilior. alb. Aromatizat. Injections also in medicated Waters are good.

Things to stop the hysterick symptoms may be, Treacle-water, with Water of the whole Citron, Oil of Amber to 2 drops in Cinnamon-water, middle aged Treacle, or Triphera without Opium, with water of Pennyroyal or Motherwort.

Then the great Antidotes will strengthen the Bowels, Treacle-Salts, Salt of Wormwood, Mint. Let Wine for Meals have Rosemary, Guaiacum or Sassafras, infused in it.

Joh. Rain.
Fortis, Trad.
de Febr. p.
m. 42.

Febris Algida, or, The Cold Ague.

Its Nature and Cure.

Cold Agues are observed some times to be troublesome not only in cold especially, but in Cold alone, so that sometimes, and more frequently, a little Heat does follow; sometimes, but more seldom, none at all: We have such in our University Hospital, so manifest, that not only in the beginning and encrease; but at the very height and declination of the fit, yea, and when it is over, the Patients are always sensible of Cold, never so much as warm, much less hot at any time.

They owe their Original to a more acid Pancreatick juice, joined with great store of viscid Phlegm, Bile in the mean time being very dull.

This Mixture will be proper for the Cold and other Symptoms, that use to accompany it; Take of water of Parsley 2 ounces, Fenil 1 ounce; Theriacal. simpl. or vitæ Matthiol. 1 ounce and an half, volatile salt of Amber 1 scruple, Syrup of Carduus benedictus 1 ounce. Which will be more effectual, if you add to the same of Laudanum Opiatum 4 grains, Oil of Cloves 2 drops. I have not hitherto observed any thing temper the cold equally to this. And as long as the Ague lasts, the Patient may take one spoonfull of this, or some such liquor, 3 or 4 times in an hour.

Sylvius de
le Boë, Præf.
l. 1. c. 30.

Febris Anginosa, or, A Fever and a Quinsie.

Its Description and Cure.

IT invades men at any time of the year, but most between Spring and Summer time, and young men and them that are of a Sanguine complexion above others; but red haired men, as I have observed more than once, above all the rest. At the very first invasion of the Disease they are cold and shake, a Fever follows, and a little after comes a pain and inflammation of the Jaws, which if it be not speedily helped, immediately the Patient cannot swallow any more, nor draw his breath through his Nostrils; but his Throat is stoppt with a certain sense of strangling, by the inflammation of the *Voula*, and swelling of the Tonills and *Larynx*.

In the first place I take a great quantity of Blood from the Arm, then from each *Ranula*; then I touch the inflamed parts with Honey of Roses, and Spirit of Sulphur: By and by I prescribe the following Gargarism, to be held in the mouth, till it be warm, without stirring it; Take of Water of Plantain, red Roses and Frog-spawn, each 4 ounces, Whites of Eggs reduced to a water by beating, No. ij. white Sugar-Candy 3 drachms, I order an Emulsion, as in a Pleurisie. The next morning, if the Fever and Pain do not abate, I open a Vein again in the Arm, and let Purging alone, till the next day. If both be abated, I presently give a gentle Purge, which after bleeding is necessary above all things, as experience testifies. If perchance, even after purging, the Fever and Symptoms should proclaim War, this must be subdued by repeated Blood-letting. Let the Patient every day keep up some hours from his bed, because the warmth of it adds strength both to the Fever, and the Symptoms.

But we must take notice that these Quinsies which are only a Symptome of this Stationary Fever, as I call it, love to be cured by the self same method, which the Fever challenges for it self; and therefore must be thrown off by Sweat and the Pores of the Skin, or by any other method, that is due to the primary Fever, whereto they are inherent.

Sydenham,
Obs. in Acut.
Sect. 4. c. 6.

Febris Anhelosa, or, The Short-breathed Fever.

Its Nature and Cure.

ANhelous or Short breathed Fevers have their name from difficult and anhelous respiration; and they put the Patients to strange and miserable Anguish either with or without palpitation of the heart. I have observed them more than once begin with a distension of the *Abdomen* and anxiety of the *Præcordia*, the Pulse being immediately weak, small and frequent, chilness and pain troubling them in the Region of the Loins at the same time. But if then they broke wind either upwards or downwards, the fit was less, if not, it was more grievous: for after this distension and anxiety had lasted one or more hours, both of them sensibly abated, and then an exceeding difficulty and shortness of Breath was raised, so great indeed, that the Body could not indure to be stirred or moved in the least, the Pulse by degrees growing rather

weaker than stronger, and continually more frequent, together with the Veins every where very turgid, which, out of the fit, were small and scarce conspicuous. This shortness of Breath was sometimes more grievous, sometimes more slight, and grieved them sometimes a longer, sometimes a shorter time. Wherefore Medicines that are good for Hypochondriack prefocation were often here likewise used with good success. And at length the fit ended rather in a Damp than a Sweat, till a new one returned, seldom every day, often every other day. I think these Fevers (as also suffocating Fevers, of which hereafter) should be ascribed to Vapours, but not very austere ones, and in like manner from a less austere Pancreatick juice, but arising from this, mixt with viscid Phlegm meeting it in the small Guts, and therefore the more flatulent, from which the symptoms enumerated may easily be derived, and well enough explicated. The anhelous anxiety, since it owns the same but a slighter cause, will be cured and abated with the like Medicines, as well in the fit, as at the beginning of it, being often used in a less quantity.

Sylvius de
le Boë, *Præx.*
l. 1. c. 30.

Febris Arthritica, or, The Gout-fever.

Its Nature and Cure.

SOME Practitioners reduce Arthritick fevers to Catarrhal fevers, because they think the Gout owes its rise to Catarrhs; But because I am of opinion, that another humour is carried together with the Blood by the Arteries to the joints, which breeds the Gout, I cannot but think, that Gout-fevers should be distinguished from Catarrhal ones. But because I could accurately enough observe the rise and progress of the Gout from the faithful relation of the sick, I as often took notice that it came with a Continual fever, or an Ague. Wherefore when a new Ague fit came, the Gout was not a little increased, till it either turned to a Continual fever, or ceased of it self, or the Ague was removed by art, the Gout-pains nevertheless continuing. I reckon to find Gout-fevers in the Pancreatick juice so corrupt, that it is troublesome only to the joints; whether it being also endued with a considerable Acrimony, which is most frequent, carries the Bile thither along with it, wherewith it had vitiously fermented, and causes a most bitter pain: Or being not so sharp, and hurting the viscid Phlegm, not the sharp Bile, which is much dulled with mixing with it, it rather hinders the motion of the part affected with an œdematous tumour, than a sharp pain. Where we must observe, that the Ague fits, which come every or every other day, do trouble the sick with no notable or molesting Cold or Heat, but rather with a small Head-ach, and thirst now and then, a little more frequent Pulse concurring, at first less, then something greater, after which also a new fit is observed, then, after a few hours, the Gout-pains are exasperated, and so indeed, that although sometimes sooner, sometimes later, they remit again in the part; yet they do not wholly intermit, but though the Ague fit be removed, the Gout-pains nevertheless continue, sometimes more, sometimes less, till they depart, either of themselves, or by art. The Cure of the Gout, accompanying the Ague, will consist, First, In an universal amendment of the Pancreatick juice. Secondly, In the correction and carrying off the Bile, that is of it self out of order, or by accident. Thirdly, In the alteration or diminution

Sylvius
de Boë, *Præx.*
l. 1. c. 1.

Sylvius,
Prax. Med.
l. 1. c. 30.

tion of whatever Phlegm is peccant. And, Fourthly, In guarding the joints affected, against future pain, and in ridding them of the present and urgent pain.

Febris Asthmatica, or, An Asthmatick Ague.

Its Nature and Cure.

Asthmatick agues are not unfrequent, so called from an *Asthma*, sometimes more grievous, sometimes more slight, that accompanies them, in which also the anxiety and distension of the *Abdomen* go before, and when they cease, shortness of breathing and a true *Asthma* follows, which, together with the fit, is long enough in abating, sometimes one or more days, and then it ceases, sometimes it continues after the fit is over. I saw such an Asthmatick ague once return at the fourteenth day, and hold the Patient very ill every time for several days, if it were not abated with convenient Medicines, both as to the anxiety and duration. The thing that produces Asthmatick agues, in my opinion, is viscid Phlegm found in the small Guts, and dissolved by the Pancreatick juice, which is about to cause a fit of an Ague, and carried with it to the Heart and Lungs, and staying there; and causing a stertorous respiration, while either many or few vapours also come out of the part, and make the fit heavier or lighter, longer or shorter. The *Asthma*, companion to the Ague, will be cured after incision of the Phlegmatick glutinous humour, by vomiting a few hours after the next fit, and sometimes a day before the fit, especially in such as are easie to vomit: for they may otherwise be purged with Phlegmagogues (such as are all Mercurial Medicines, Coloquintida, and Hermodactyls) which are more powerfull and effectual. As for phlegmatick humours, that sometimes fall likewise from the head, and fill the *aspera arteria*, the same Phlegmagogues will be proper for them, often in a less quantity, used together with incisers and correctors of Phlegm, and especially in the form of Pills. As to stultent Vapours, that so often, if not always, produce an *Asthma*, or at least increase it much, all things will be convenient, which hinder the matter of them, and that discuss and dissipate them when produced.

Sylvius de le
Boë, Prax.
l. 1. c. 13.

Febris Cacatoria, or, A Loofe-fever.

Its Cause and Cure.

There are Fevers observed to be very troublesome and weakning to the Patient, through a large or a frequent going to stool, and sometimes also griping at divers times of the fit, and therefore they are called *Cacatory*, *Dejection* or *Loofe-fevers*. I think it ought wholly to be imputed to choler, that is not so volatile, but rather sharp, and by a mixture of the Pancreatick juice yet made more sharp, and after the Phlegm in the Guts is dissolved, fretting the Guts, and irritating and forcing them upon propulsion of their contents downwards. What things soever fix Bile, and powerfully render it inept to ferment, will cure them, as are all austere things, thickeners and coagulaters of it, as also Opiates dulling of it, mixt together, and often used at

several times in a small quantity, for example; Take of Conserve of red Roses 2 ounces, *Discordium* 2 drachms, *Confectio Hyacinthi* 1 drachm, *Terra sigillata* 1 scruple, Dragon's Blood half a scruple. Mix them, make an Electuary. And Medicines made in a dry form must here be preferred, because moist things dilute the Bile too much, and the Pancreatick juice, and rather cause than stop their Effervescence.

Sylvius de le
Boë, Prax.
l. 1. c. 30.

Febris capitalis, or, A Head fever.

The Contents.

Its Nature and Cure. I.

Its Epidemical Constitution. II.

I. THE seat of all Fevers must not be sought in the lower Belly, for oftentimes there is an Obstruction, or an humour thoroughly fixt in certain parts; as in the Head, Spleen, Lungs, &c. or some corruption is contracted, whence a Cephalick, Splenetick, Pulmonary fever, &c. ariseth. That the focus of burning fevers is in the Head *Hippocrates* seems to assert. If in a Burning fever (saith he *1 Prorrh. 18.*) there be a noise in the Ears with dimness of sight, and a stoppage arise in the Nose, they are mad from Melancholy. *Galen* explains this place, of a Burning fever, whose focus is in the Brain, by reason of Bile gathered in it, which causes the Inflammation. Such a Fever, generals premised, must be cured particularly by such things as ease the Head of the Burthen, by opening the Veins of the Nose and the Jugulars, by applying Leeches to the Temples, Forehead, and behind the Ears, by Arteriotomy, &c. In Summer, 1678. such Fevers were abroad, and were reckoned by most of our Country Physicians for Malignant, because the heat in the whole Body was gentle; but there were evident signs of the Head's being full, from these Symptoms, the Head-ach, Doting, and Sleepiness to excess. Most escaped, who were bled betimes in the Jugulars, or who had a Hæmorrhagy; In some, who neglected these means, and used onely Bezoarticks; after they were dead, the Blood burst out at their Nose, Mouth and Ears.

II. About the beginning of the month of July, 1673. a certain sort of Fever was abroad, which at the first coming had Symptoms joined with it, that gave no obscure marks, that then the inflammation was greater, and more spirituous, than when the Disease was grown older. Beside what things are common to all Fevers, these attended this Fever: The Patient was for the most part troubled with a pain in his Head, and a violent one in his Back, with stupidity likewise, and a certain affection not unlike a *Coma* was remarkable, wherewith the Patient being taken was dull and doted, yea and sometimes drowzed for several Weeks, and could not be awaked without loud calling. His Head when he recovered was weak and infirm for several days, it nodded sometimes this way, and sometimes that, and there were other signs which shewed that the Head had suffered very much. Sometimes the Patient did not so much drowze, as calmly dote. In Autumn, 1675. this Fever did affect to seek its flight by a Dyentery, and sometimes by a *Diarrhea*. As to the Cure I accounted nothing more proper than to fix my Eyes on what did good, and what did harm. The violent Head-ach, and the propensity this Disease had to fix pains in the Sides, as also bloud like that of Pleuriticks, presently taught me, that there was no small Inflammation in this Fever, nor yet that it could bear that plentiful Bleeding which is proper for a Pleurisie: for after the Blood had

had been let the first or at least the second time, it wholly lost the fizy colour, wherewith the surface of it was covered, nor was the Patient relieved by repeated Bleeding, unless perhaps the Disease turned into a true Pleurisie, which sometimes fell out, after a Regiment hotter than it ought to be. Now when I was deterred from repeated Bleeding both by Experience and Example, although it was clear, that this Fever was not a little inflammatory, nothing remained, whereby its Heat might be quenched, besides Clysters often repeated and cooling Medicines. But beside these symptoms, which openly bewrayed Inflammation, that *Phenomenon* of stupidity, familiar to this Fever, did fully indicate, that Clysters should continually be repeated whereby the febrile matter, which so readily got into the Head, might be diverted from it: Moreover, they were substituted in the room of repeated Bleeding, which the peculiar nature of this Disease could not well endure, and supplied its defect, in quietly and gradually tempering the Blood, and carrying off the morbid Cause. Farther, I thought large Epispastick Plasters, applied behind to the Neck, were of more use in this Fever, than in others, wherein the febrile matter did not seize the Head so much: For by the violent pain and heat which the said Epispasticks usually impress on the part whereto they are applied, the matter which otherwise would ascend to the Head, is derived to the place so affected. To these means, and a Regiment conducing to the same end, of cooling the Blood, the Disease at length did, as it were, naturally, and of its own accord, give way, how much soever it raged, if a man encountered it in any other method, which was clear to me from Experience: For when the edge of the Disease was taken off by the foregoing Ebullition, and the Patient was out of Gun shot, and secure from those violent Symptoms which depended on it, we found nothing better than to let the Disease take its own course, and gradually abate of it self; which ever succeeded better with me, than to attempt any violent evacuation whatever, at such a time: In the mean time I forbade my Patient flesh, but gave him as much small Beer as he would drink. And there was one thing more, which must not be forgot in describing the Regiment of this Disease; because upon the credit of manifold experience it turned to the Patient's advantage, namely, that the Patient kept every day up from his bed for some hours; or if his weakness hindered that, he put on his cloaths at least, and lay upon the bed, with his Head somewhat high. For when I considered the great violence, wherewith the Fever was carried to the Head, and the inflammatory disposition of the blood also, it came into my mind, that the Patient might reap some advantage from the posture of his Body, if, namely, it were such as that the heat might not at all be encreased by what was circumambient (which it must of necessity be, if he kept in bed continually,) nor the violence of the blood tending towards the Head promoted, seeing thereby the heat of the Brain would be encreased, and therefore the Animal Spirits heated and exagitated, upon which there would be a more vehement vibration of the Heat, and an encrease of the Fever.

I found the foresaid method, by Bleeding and Clysters succeed most happily, but it always had not only anomalous and ill natured Symptoms, but a dubious Issue, when it was provoked by Diaphoreticks. In the mean time that tacit *Delirium* grew eminent, which though indeed sometimes I have seen it come of it self, yet by the over diligence of Nurses, mis-employed in causing Sweat, for the most part it was invited: For by this means the morbid matter, which in this sort of Fevers refused to give way to Sweat, being violently moved, was at length raised to the Head, to the great hazard of the Patient.

I could not conquer the stupidity (very familiar to Children) when the Disease came first, although I left no stone unturned, and took to my assistance repeated blood-letting, in the Armes, Neck and Feet, Vesicatories, Cuppings, Clysters, Diaphoreticks of all sorts, &c. At length, after I had bled in the Arm, and drawn a Blister in the Neck, and given two or three Clysters of Milk and Sugar in the first days of the Disease, I resolved to try nothing farther; but only that I forbade the Patient Flesh, and all spirituous Liquors whatever. In the mean time I diligently attended Nature's method, that insisting on her footsteps, I might at length learn to conquer this Symptom. In the mean while the Disease which I was watching withdrawing safely, though slowly, at length vanished. Therefore I reckoned I was to insist on this Method, in all Fevers which I thenceforth had the cure of. This I know by diligent observation, that in this Fever the said Symptom, after general Evacuations, I say, after Bleeding and Clysters, used to be successfully conquered by Time alone.

A Phrenzy came upon this Fever, but rarely, in which the Patient slept neither night nor day, he could no way be ruled, and it took him away in a few days, unless the inflammation were stopt. And here Spirit of Vitriol did me service above all other things, which after Bleeding and a Clyster or two, I gave to be dropt into small Beer for his ordinary drink: This in a few days procured sleep, and having conquered all Symptoms, restored the Patient, which indeed I could effect by no other method. And this was abundantly made out to me by often repeated Experience. Sydenham, Obs. in Acute Febr. p. 317, &c.

Febris Cardiaca, or, The Heart-Ague.

(See Febris Syncopalis.)

Its Description and Cure.

Heart-agues occur, being accompanied with unspeakable, and oftentimes intolerable pain, about the upper orifice of the Stomach, and they are especially grievous in this Symptom, whether vomiting concur or not; sometimes they are Epidemick. The Pancreatick juice breeds them, when it has got a corrosive faculty by stagnation, especially when sharp Bile concurs, and a potent Effervescency happens upon their conflux, whence very sharp Vapours arising to the upper orifice of the Stomach, they sharply fret and corrode it.

So bitter a pain at the Heart will be cured by Opiates especially, which may be added to divers Medicines, according to the diversity of other Symptoms that concur therewith, because they assuage both the sharps, which are the cause of this Disease. Let them be taken often, and in a small quantity, till you obtain what you desire. Sylvius de le Boe, Pract. l. 1. c. 30.

Febris

Febris Catarrhalis, or, A Catarrh Fever.

The Contents.

The Description and Cure. I.

It arises from the Mesentery. II.

I. THE immoderate Heat last Summer was attended by as intense Cold the Winter following. The Earth was covered with Snow, a North Wind blowing till the Calends of *June*. All the Winter it was a pretty healthy time. About the end of *April* in the year 1658. there arose a Disease on a sudden, which seized very many at once, so that in some Towns above a Thousand People were sick together in one week's time. The Pathognomick Symptom of this Disease, and that which first invaded the Patients was a troublesome Cough with much spitting, and a Catarrh falling upon the Throat, Palate and Nose: There was also a febrile Intemperature, with Heat and Thirst, want of Appetite, spontaneous Lassitude, and a dull pain in the Back and Limbs. The Fever was in some more remits, that they could walk abroad; in others more intense, with heat, great thirst, watching, hoarseness, and other Symptoms. The original and formal reason of this Disease were chiefly founded in two things, namely, in that there happened at the same time a more than usual effervescence of the blood, caused by the Spring season, and also a great constriction of the Pores, caused by a precedaneous tract of time, that was exceedingly over cold, that there was not free room for the blood as it wrought in the Veins. The case stood thus, as if Wine, when it begins to work, were put in Vessels close stop: for by this means both the Vessels and liquor are in danger of being lost. But, that a North Wind is most apt to produce Catarrhs, besides *Hippocrates* his Testimony, common Experience confirms it: As to the Symptoms joined with this Disease, they were caused by Blood fermenting too much, and not eventilated enough; therefore a simple Continant fever, or one of many days, was caused, a little of the thinner blood being heated, and the rest onely put into confusion. In some that had an ill disposition of the blood, or a bad habit of body, it turned into a putrid and mortal Fever. The Cough with a Catarrh that accompanied this Fever, had its original from a ferous humour, that had been long gathering in the blood, because transpiration was stop, and then, upon the rising of an effervescence, sweating out so much the more, by the small Arteries, that open inwards: For when the Pores are stop, the superfluous ferosities, that were used to evaporate outwards, are by nearer purification of the blood poured inwards upon the Lungs: Which is the reason that a Cough is for the most part raised upon taking a Cold, that is, upon transpiration outwards being hindred. As to the Cure, when this Disease is but slight, its Cure is for the most part left to Nature; for this Fever, since it is onely a simple Continant, uses to end within a few days in sweat. Wherefore after a plentiful sweat, the heat and thirst, weariness and dull pains are done usually about the third or fourth day: Then the Cough continuing a little longer, does ever after by little and little decrease. If the Disease be more thoroughly fixt, it must be cured according to the rules that are observed in Putrid fevers, but with this difference, that because transpiration hindred, and the pouring of the ferous humour into the Lungs are in fault, therefore Diaphoreticks and Thoracicks are of more frequent use, for they hinder the flowing of the Serum out of the Vessels inwards, and either by opening the Pores convey it outwards, or by precipitating it from the blood, discharge it by the urinary passages: The Remedies therefore which are by fre-

quent experience vulgarly held to doe most good in this Disease, are Sweating and Letting blood. For when the Vessels are emptied either way, both the immoderate effervescence of the Blood, and the exuberance of the Serum are restrained.

Sylvius de le Boë, *Pr. Med.* l. 1. c. 30. calls them Catarrhagues, which come from a Catarrh, falling not onely on the Lungs, but on any other part, that moves and ceases together with the Ague fit; for a new humour falls not on the parts out of the Ague fit; and what is falln already, does not recede, or leave the part affected, although the Ague fit be over. And they are owing to the humours gathered by little and little in the Head, which are dissolved by the cause of the Ague being carried thither, and moved every way to their distillation and defluxion. The Catarrhs that are moved to their defluxion at the time of the Ague fit, require different Medicines, according as they consist of a different matter, and affect different parts. In general, their vicious quality must be corrected, their plenty abated, and the parts that are usually affected by them must be strengthened. Therefore thick and viscus Cararrhs must be attenuated and cut by Aromaticks: But ferous and salt ones must be tempered with oily things and Opiates: Thick ones must be evacuated with Phlegmagogues, ferous ones with Hydragogues: The parts affected, or like to be affected, must be strengthened against viscus and thick Phlegm by Aromaticks that are gratefull to them; against a salt Serum by glutinous things, both external and internal.

II. *Galen*, 6 de *Sanit. tuend.* 9. said right, that they who are obnoxious to distillations, are prone to many and divers Diseases, according to the imbecillity of different parts. For when the Brain it self has poured abundance out of it self, (*lib. de Carnib.* 17.) if the Patients have weak Lungs by Nature, and the Brain be weakened by a foregoing Fever, and made fit to produce matter for a Catarrh (wherefore *Galen* 3. de *Sympt. Caus.* 4. said, that a Catarrh is caused, when the Brain being either too much cooled, or over hot, is weakened, and so concocts badly, and breeds much Excrements, to which the retentive faculty is forced to give way, whence on necessity a fluxion to the lower parts is raised, which falling on the Lungs causes a Cough,) sometimes a far greater quantity of the Catarrh falls upon the Stomach and Mesentery by the Gullet, than does upon the Lungs by the Wind-pipe: And this being kept a long time in the Mesentery, and not ventilated, often conceives a putrefactive heat, and raises a Fever, obstructions giving no small help to the putrefaction, together with the defluxion, which maintains them. And it is not to be doubted, but Vapours are carried from the lower natural parts by the Veins, and spaces into the Head, and crudities also from the whole venous kind, which circulation is accounted the worst by *Hippocrates*. Nor let it seem marvelous to any Man, that this Fever must be called a Putrid, but not a Humour Fever; since *Galen* called the watry spittle of the Aliment, and the ferosities that distill from the Brain, excrementitious humidities; but he would never call them Phlegm, because it is a juice declining a little from the perfection of blood: But this juice of the Brain, or improper Phlegm, is an excrement of the third concoction, and therefore should not be reckoned among pituitous humours. And there are other Putrid Fevers that are not humoral, as such as proceed from some inward Ulcer; yet they must all properly be called Symptomack. For the cure of them, first of all, the first ways must be cleanted. Secondly, Obstructions must be opened. Thirdly, The febrile heat must be moderately allayed. Fourthly, The venous kind and Head must be gently purged. Fifthly, The hot and moist intemperature of the Head must be qualified. And lastly, the Distillation must by all means possible be diverted from the Wind-Pipe and Gullet.

Febris Colica vel Torminalis, or, *The Colick, or Gripe-Ague.**Its Description and Cure.*

There are now and then some Agues observed, which may be called Colick, or Gripe-agues, from the most grievous Gripes of the Belly, and racking Distensions of the same, coming and going with the Ague fit. They are caused by the Pancreatic juice, made more sharp and austere by its stagnation, and exerting its Acrimony sometimes upon the small, sometimes upon the greater Guts likewise: With which, if viscid phlegm and bile, but moderately sharp, do concur, wind is raised, which, together with the Guts, distends the *Abdomen*, and create a violent Colick pain, companion to the Ague. The following mixture will be good for these Agues; Take of Water of Mint 2 ounces, *Vite Matthiol.* 1 ounce. Or, Take of Tincture of Cinnamon half an ounce, Oil of Cloves 6 drops, Syrup of Scurvygrafs 1 ounce. Take a Spoonfull now and then.

Sylvius de le
Boë. *Prax.*
Med. l. i. c.
30.

Febris Colliquans, or, *A Colliquating Fever.**The Contents.*

Whether Cold Water may be given for prevention in a Malignant one? I.

When it must be given? II.

The Diet. III.

The Observation of Diet, and drinking Cold Water better than Medicines. IV.

I. BECAUSE all things are reduced to Colliquation alone, therefore we must insist on it, not indeed by drinking Cold water, which *Aetius*, *Paulus* and *Oribasius* gave for a Colliquative fever, but rather with binding and thickning remedies, that are endued with a subaptick faculty, such as *Terra Sigillata vera* to a scruple, and so *Bole Armenick*: Also ten or twelve grains of Emerald Powder. All of them must be given in Plantain-water and Juice of Quinces. And upon urgent necessity we must proceed to Opiates by degrees; and first of all we must use Syrup of Popy, then *Laudanum*, and last of all new Treacle, reformed with Pearl. ¶ But in a burning Colliquative fever, where there are two Pathognomick signs, Burning Heat and unquenchable Thirst, drinking of Cold water seems to have the chief place; and the reason is, because it is a Remedy both for the Burning and Colliquating febrile Heat.

Fortis de
Febr.

Idem.

II. *Galen* reduced all the conditions requisite to the drinking of Cold water to three, goodness of Strength, signs of Coction, and a most violent Burning fever; which last condition serves for the Indicant, Strength for the Permittent, Coction for the Prohibent. Nevertheless, no manifest signs of Coction appearing, we may presently give Cold water, after *Averrhoes* his example, who gave Cold water, not waiting for Coction: For, said he, the Patient may die dried up before Coction; and we may say, Colliquated and consumed. It may be given therefore, but not in such a quantity, as to fiske the innate Heat, that is, not above five or six pounds at most: And the day following, instead of it, distilled Waters of the Juice of cooling herbs may be given.

Idem.

III. *Hippocrates 4 de rat. viſſ.* teaches, that the Diet should be cooling, and moderately astringent, and thicker a little than the Disease requires; who, treating of the Cure of Fevers, with a Looseness waſting and consuming the Body, taught, that cooling and thick Broths should be given them, and, notwithstanding their *delirium*, he orders them to drink a little more vinous and astringent drink. Whence we gather, that such a Diet must be given, as may relieve the dissolution of the Body, though it may seem to add to the Disease and its Symptoms. And things that hinder the dissolution of the Body are threefold; to wit, things that respect the Body, and the Humour, and them both: They belong to the first, which afford much nourishment to the Body; and are easie of digestion: Things that are potentially cold, to the second: And whatever cooling Viſuals partake of an Astringent virtue, to the third. Therefore in Colliquating fevers, that is the best food, which nourishes, cools, and binds moderately. So Bread soaked in the Juice of sowre Pomegranate is proper. Cold water is a most proper drink and Medicine, as it respects both the Body and the Humour.

IV. Farthermore, we must know, that a right administration of Diet, and drinking of cold Water is the best remedy, and Medicines doe little good; Wherefore we must be very carefull, that the food be of good nourishment, and easie digestion, with which we must mix things that may cool and bind a little; for things that are very binding are therefore improper, because they keep the morbid cause within the body, seeing they obstruct all the ways for evacuation. And the best food that I know, is Barley-Ptisan, made in the manner following; Boil two well-fleſhed Pullets with three handfulls of French Barley, and one of Purflain; a little before you remove it from the fire, put in one pugil of the Kernels of a sowre Pomegranate, *Brudus de viſſ. Febr. 4.* let it boil till the Barley burst, and when you have put a little Sugar to it, let it be given to them *l. c. 21.* whose strength is brought low.

Febris delira, or, *The Doating Ague.**Its Nature and Cure.*

AS Continual Fevers, so Agues frequently occur, which may be called Mad or Doating-Agues; the *delirium* appearing seldom indeed during the cold Fit, but often when the hot Fit is on a Man. Which, that they should be attributed, the Fever being sharp enough of it self, to the Bile, made yet sharper upon its meeting with the pancreatic juice, which causes a new Ague-fit, other Symptoms commonly concomitant do evince. Those things will cure, which both powerfully and gently correct, and temper the acrimony of the bile, such as are especially Oily things, Emulsions and Opiates within and without.

Sylvius de le
Boë. *Prax.*
Med. l. i. c.
30.

Febris

Febris Dysenterica, or a Dysenterick Fever.

Its Description and Cure.

IN the beginning of Autumn, in the year 1669, when the Bloody-flux raged, a certain Fever arose with it, which was very like that Fever that usually attends Dysenterick persons, which indeed seized not them onely, who had had the Dysentery, but those that had been wholly free from it; For it had the same manifest or apparent Causes, which a Dysentery has, and the same Symptoms for all the World, which accompanied the Fevers of Dysenterick persons: So that if you do but except the Stools of people in a Bloody-flux, and the said Symptoms which necessarily depend on them, the Fever seemed wholly of the same nature with the Dysenteries themselves. Therefore I called this a Dysenterick fever: It sometimes began with Gripes, but moderate ones, or sometimes they came a little after it, but often there were no Gripes at all.

For the cure of this Disease, after I had observed that the Phenomena of the Fever of most Dysenterick persons were the very same with them that accompanied the Solitary Fevers of this year, it seemed consentaneous to me, that my Patients might be cured, if I did in some measure imitate that evacuation, by which Nature uses to throw off that corrosive and sharp matter, which is the continent cause of the Dysentery it self, and of the Fever that attends it. And therefore I encountered this Fever in the very same method, both as to Bleeding and repeated Purging and Cordials, as I used in the cure of the Dysentery above. Except that I found, that Paregoricks given between the Purges, did not onely doe no good, but that they did harm, otherwise than in the Dysentery, because the Matter was detained by them, that should have been carried off by Purging. The Patient lived for the first days of the Disease upon Oatmeal and Barley-Grevel: His drink was small Beer a little warm. And after I had Purged him once or twice, I saw no necessity to forbid my Patient a little Chicken, or some such meat, easie of Digestion, since this curing of him by Purging may allow it, which could not be granted, if we went another way to work. The third Purge for the most part, one day being always interposed, made an end of the Disease: Yet this did not always hold good, but sometimes more were to be used. If, when the Fever was gone, the Patients strength was broken and feeble, and they recovered slowly (which frequently happened to hyterick persons) I endeavoured to restore it, and to recall the Spirits that were run away and dissipated, to their deserted Stations, by giving Laudanum in a little dose: but I rarely repeated that remedy, nor ever prescribed it, till two or three days after the last Purge: But nothing made so much for renewing the strength, and refreshing the Spirits, as a free use of the open Air, presently as the Fever was departed. And I took the occasion of insisting on this practice from hence; In the beginning almost of this Constitution I was called to a young Woman, lying sick indeed of a Fever, and almost killed with a most bitter pain in her forehead, and with other Symptoms, with which we have already said, that this Dysenterick fever was loaded. When I enquired of her, in what manner the Fever first took her, and how long she had had it, she confessed, that fourteen days agoe she had been freed of a Dysentery; to which, either going away of it self, or forced away by help of Medicines, the said Fever forthwith succeeded with an Head-ach: Which I did conjecture I might be best able to prevent, if I

substituted another evacuation instead of the Dysentery, very like that, upon stopping of which the Fever arose; and therefore I restored her in the method before recommended. And the Fevers of this Constitution did most readily yield themselves to this method. In young people, and sometimes in those that were a little elder, this Fever now and then got into the head, upon which they grew delirious, not indeed as in other Fevers, after the manner of a Phrensie, but they were struck with a Stupidity, which came very nigh a Carus. This happened to them, above all the rest, who had in any sort, unfortunately employed themselves in ex-torting Sweats.

An Ephemera from constipation of the Skin, cured by Hy-droticks. VIII.

I. WHETHER is a Bath proper in one-day Fevers? For the resolution, we must know, that a Bath of Sweet-water may be considered in respect of its divers parts, whereof Galen, l. 10. method. enumerates four. 1. The Air of the Bath, by virtue of which Sweat is raised. 2. A seat of hot Water. 3. A seat of cold Water. 4. That part of it where the Sweat is wiped off. But since the causes of one-day Fevers are various and divers, we must take notice, that the hot Air of the Bath is proper for those Diaries which are caused by the closeness of the Skin, obstruction of the Pores, or swelling of the Glands: But it is hurtfull for those that are caused by commotions of the mind, by weariness, heat of the Sun and the like: A seat of hot Water may more safely be used in every Diary: A seat of cold water cannot be granted without caution: But then it is proper for every one to wipe off the Sweat. Foresius his limitation laid down, lib. 1. obs. 6. must be observed, that all these things may be proceeded on in an Ephemera, as such: For where Obstructions, internal Crudities, Loathings, Catarrhs, Loosness, &c. occur, we must abstain from Baths. We must take notice also, that some Modern Physicians have substituted other remedies instead of Baths, because we want that provision which was familiar to the Ancients: And farthermore for this reason, because most people are delinquent in their diet, and hereupon heaping up of crudities renders their bodies unfit for the use of the Bathe.

II. Galen is found fault with by Trallianus for prescribing meth. med. c. 5. Diatrion pipereon simplex, where, when the body is costive, crude aliment is lodged in the Stomach; and 4 de sanit. tuend. for giving it in a nidorous crudity, which is proper neither on the account of the Fever, nor of its cause, which is the effect of an ever intense heat. But Galen's design is, to provoke the expulsive faculty by a Medicine endued with such acrimony, to the end that the corrupt aliment may depart to the Guts, and what crude remains, may be farther concocted and digested.

Idem.

digested. Besides, if it be given, when the Body is Purged, it does no harm, because its heat is extinguished in the first ways, and goes not into the Veins, but in the mean time it strengthens the weak Stomach.

Primirosius, de Feb. l. 1. c. 5.

III. *Traillianus* his Medicine deserves notice, who commends drinking of warm Water, where Meat is in the Stomach; for it wathes, cleanses, and drives the Meat into the lower Belly, it tempers the inflamed Spirits; and he says, he knows not a better remedy: and truly it is an excellent one.

IV. *Ozymel* is suspected by some, upon the account of the Honey, whose heat seems hurtfull for several persons, because it easily turns to choler: But it is truly agreeable, because it dissolves what is thick and glutinous, and opens obstructed passages. Besides, all things should be considered in it, of which it consists, and not the qualities of the Honey onely should be considered (which by *Quercetan*, *Pharm. Dogm.* c. 10. is preferred before Sugar, as being more pure and defecate; for Sugar, if its sweetness be not corrected, easily turns to bile and obstructs the Bowels by its viscosity) but also the vitriolate quality of the Vinegar joined with the watry humidity, does so abate the heat of the Honey, that its deterfive and aperient virtue is apparent without any remarkable heat. The fretting of the Guts, and raising a Cough need not be feared much, if there be but a moderate quantity of Vinegar.

G. Horstius.

V. It is a question, whether drinking of cold Water be proper in an imputrid Continent fever. But we must observe, that when *Galen* forbids drinking of cold Water, before signs of coction, it must be understood of putrid Fevers: for in this Fever, that is, void of putrefaction, it may be given even in the beginning, so there be the conditions requisite, absence of obstructions in the Bowels, of a Phlegmon, of a weak Stomach, &c. But according to *Riverius*, since this sort of Remedy is become obsolete, and it is scarce possible to observe all the conditions, and that mischiefs arise from the preposterous use of it, it is better to doe the business by safe means.

VI. The second greatest remedy for Continent fevers is drinking of cold Water, which *Galen* omitted in curing that young Gentleman, 9 *Meth.* 5. because Bleeding alone was sufficient: But this Remedy would be pernicious to one that stood in need of plenteous Bleeding, because by incrassating the Plenty within the body, it would stop and stiffen it: And the innate heat, being as it were stifled by much thick blood, would be quite smothered by drinking of cold water. When yet some hæmophobic Physicians have falsely thought, that drinking cold water was a Remedy that might be substituted to Bleeding, although without taking away blood it cannot be administered. So that Bleeding indeed without drinking cold Water, may be admitted; but drinking of cold Water without precedent Bleeding cannot.

Fortis l. de Feb. p. 4 & 5.

VII. Blood may be taken away in a Continent fever, to fainting, whatever *Averroes* talks against *Galen* and *Hippocrates* himself. It may be he does not distinguish Fainting from Swooning, as *Galen* l. de S. m. c. 12. has distinguished, saying, That while blood is taking away, to fainting, we must be attent to the change of the Pulse, lest they fall into a Swoon. By this evacuation the redundancy of the hot blood is diminished, the whole body cooled, and reduced to its natural temper, whereby Nature being relieved, is able to expell and separate the rest.

Idem.

VIII. Many who have been wet in the Rain fall sick, and especially into a Continual fever, transpiration being stopt, which is very apt to cause Fevers. After Bleeding, I found nothing better, than to open the Body with a Sudorifick Decoction; Take *Sassa Parilla* 1 ounce, Seeds of *Carduus Benedictus* half an ounce, Leaves of *Scabious*, *Marigold*, each

half an handful. Make a Decoction of them all, which must be taken very hot with a little White-wine, or a few drops of Treacle-water. I have seen some Physicians, who did not in the least dream of Sudorificks, but when they observed the effects of our Potion, they commended it.

P. Pachecus in obs. Riv. rii 61.

Febris Epiala, or, A Fever, in which a Man is sensible of Heat and Cold all over his Body, in the same part, and at the same time.

The Contents.

What form of Diet must be observed? I.

Its Cure. II.

What sort of Aperiens are proper? III.

I. They are deceived, that think, there should be a thinner Diet in an *Epiala*, than in a simple Quotidian; Whereas the Diet should be fuller, and the reason is, because in a Quotidian sweet Phlegm offends, that by farther coction may be converted into blood and nutrition; which can never be expected from vitreous Phlegm. And the same way must be taken in all other preternatural sorts of Phlegm.

II. *Sylvius de le Boë*, *Prax. lib. 1. cap. 30.* judges *Epialas* to be double Agues, but both caused by a sharp Pancreatick juice, and a sharp bile; And so indeed, as that the Cold of one continually meets with the Heat of the other, and a new fit of the former, and the Cold, returns, when the heat of the latter is augmented, and he prescribes Medicines compounded of the foresaid subcontraries, which respect both the Phlegmatick and Cholerick humours, that abound in the same Patient. Let this mixture be for an example; Take of Water of *Carduus Benedictus*, Succory, each 1 ounce and an half, simple Treacle Water, distilled Vinegar, each 6 ounces, Powder of Crabs-eyes, half an ounce, Syrup of the five opening Roots 1 ounce. Mix them.

III. There is this property in all these Fevers, to wit, that all things which dry as well as heat, are inconvenient for these Fevers, because they make the matter thicker, the thinner parts being digested into exhalations: And seeing Physicians assert, that the matter of these Fevers is thick humours, which cause both Heat and Cold at once, they seem not to advise very wholesomely, who give such Feverish Persons Broth of Vetches, and Brine: Certainly, it were more proper for them to use things, which being moist, may also cleanse and cut.

Brudus de visu Febr. l. 3. c. 25.

Febris Erysipelatosa, or, A St. Anthony's Fire Fever.

The Contents.

Its description and cure: I.

It has affinity with a Pestilential Fever. II.

I. This Disease seizes any part of the Body, and that at any season, and the Face above all other parts, and especially at the latter end of Summer; at which season often the Patient is taken, as he is abroad in the open Air. For the Face is swelled on a sudden, the Swelling begins with extreme heat and redness, and is thick beset with small Pustules, which, when the Inflammation is farther increased sometimes run into Blisters: Then it

it creeps farther over the Forehead and Head it self, the Eyes in the mean time being quite covered over with the Swelling. (The Country People call it Blasting) nor indeed is it made different from those Symptoms that attend the Stinging of Bees or Waips, but that there are Pustules. And such is the most known and vulgar sort of *St. Anthony's Fire*.

But what part of the body soever this Ail seizes, as also at what time of the year soever it comes, Cold and Shaking, unless they go before (which sometime falls out a day or two before) for the most part accompany this Inflammation, as also Thirst, Restlessness, and other signs of Fevers. In the process of the Disease, as the Fever first caused pain, Swelling and other Symptoms (which increasing every day, sometimes end in a Gangrene) so these in their turn contribute no small share to the increase of the Fever, till both of them be extinguished with proper Remedies.

And there is another sort of this Disease, though more rarely occurring: This invades a Man at any time of the year, and that usually for this reason, to wit, because the Patient has given himself to drink subtle and attenuating Wines a little too freely, or some such spirituous liquour. The Fever, which leads the Van, is attended by the breaking out of Pustules almost all the body over, which resemble the stinging of Nettles, and sometimes rise in Blisters, and then striking in again hide themselves like little knots under the Skin, with a most biting and intolerable Itch.

Here I judge, the peccant matter mixt with the bloud should by right be evacuated, and the ebullition of the same bloud should be stopt with Remedies that temper it; and lastly, that the matter, which is now settled in the parts, should be got out and discussed.

That these things may be done, as soon as I come, I order a large quantity of bloud to be taken from the Arm, which indeed almost ever resembles the bloud of pleuritick persons. The day following I give the gentle Purging Potion, familiar to me in my practice, and at the hour of sleep (if perhaps the Patient have Purged too much) some Paregorick Draught, as *Syrupus de Meconio* in Cowslip-flower-water, or some such thing. When the Purge has done working, I order the part grieved to be fomented with the following Decoction; Take of the Roots of Marshmallow and Lily each 2 ounces, Leaves of Mallows, Elder, Mullein, each 2 handfulls, Flowers of Melilot, Tops of St. John's-wort, and Lesser Centaury, each 1 handfull, Linseed and Fennugreek-seed, each half an ounce. Boil them in a sufficient quantity of Water to 3 pounds. Let the Liquour be strained, and at the time of use add to every pound of the Decoction Spirit of Wine 2 ounces. Let some folds of thin Flannel be dipt in this decoction, and strained out, and then applied warm to the part twice a day, which after fomentation may daily be anointed with this following Mixture; Take of Spirit of Wine half a pound, Venice-Treacle 2 ounces, Powder of Long Pepper, Cloves, each 2 drachms. Mix them. Let a brown Paper, wet in this Mixture, be wrapt about the part.

Moreover, I advise the Patient to feed onely on Barley, and Oatmeal-Grevel, and roasted Apples; and also to drink very small Beer, and to keep up for some hours every day from his Bed. By this Method both the Fever and other Symptoms are for the most part quickly put to flight. But if not, I again breathe a Vein, which now and then must be done a third time, a day always passing between, to wit, if there be a bad disposition in the bloud, and a violent Fever. The days he does not bleed, I prescribe a Clyster of Milk, and Syrup of Violets, and cooling Juleps of Water of Water-Lily, &c. already mentioned in the cure of the

Rheumatism, to be used any hour of the day. But for the most part, once Bleeding, and a Purge following, if they be used in time, doe the business.

That sort, which resembles the stinging of Nettles, with an Itch, must be got away by the like means; but that this stands in less need of outward applications.

II. Certainly, in my judgment, we may see no obscure resemblance of the Plague, with that Inflammation, which the *Latins* call *Ignis sacer*, and we in our own Language *St. Anthony's Fire*. For this Disease is with sound Physicians, a continual Fever, deriving its original from the thinner part of the bloud, being corrupted and inflamed, from which, that Nature may free her self, she expells it to some external part of the body, in which a Tumour, or rather (seeing oftentimes no such remarkable Tumour appears) a red, broad, spreading spot, which they call *the Rose*, appears. And this Fever, after it has afflicted the Patient a day or two, ends critically in this Swelling, and furthermore there is sometimes a pain in the Glands under the Arm-pits, or in the Groin. And this Disease commonly seizes a Man as the Pestilence, with a chillness and a Feverish Heat following, so that they who have never had it before, think they are taken with the Plague, till at last the Disease shew it self in the Leg, or in some other part. Besides some Authours suspect, that there is something of Malignity in this Disease, and therefore they determine the cure to be in the use of Sudorificks, and Alexipharmacks. This flame indeed, when it has stirred up an Ebullition, by means whereof the particles of the bloud being slightly singed, and as it were blasted, are in a short time cast out, is extinguished of its own accord, without attempting any farther mischief.

Febris Hæmorrhagica, Hæmoptoïca, or, *The Bleeding, and Bloud-spitting Fever.*

Its Description and Cure.

SOME Fevers may deservedly be reckoned among the Intercurrent, which because some way or other they immediately make way for themselves, and end in this or that Symptome, are vulgarly not accounted Fevers, although originally they were truly such, and that affection from which the Disease borrowed its name, is onely a Symptome of the Fever, which is at last terminated therein; At present I shall onely take notice of two, Bleeding at the Nose and Spitting of Bloud.

Bleeding at the Nose annoys a Man at every season of the year, especially them that have a hot bloud, and are of a weakly Constitution, and that, more in Age than Youth. Usually, at its first approach, it makes some shew of a Fever, in that, while it makes its way, where it confined it, pain and heat in the Forehead do yet torment Men; the Bloud runs for some hours, then it stops a while, by and by it bursts out again, and so by turns, till at length being stopt, either by the use of Medicines, or of its own accord, because of the abatement and loss of a great quantity it wholly ceases; yet so as that the Patient may fear a Relapse every year, if he should happen to heat himself, either with Spirituous Liquours, or on any other occasion whatever.

This is the end I propose to myself, that the too great heat and ebullition of the bloud, whence the

said

said extravasation arises contrary to the usage of Nature, may be by all means restrained, and its violence turned another way. Therefore I frequently open a Vein in the Arm, and take blood liberally away, in colour ever answering the blood of pleuritic persons: I injoin a cooling and thickning course of Diet, as of Spring-water 8 parts, and one of Milk, boiled together, to be drunk cold; baked Apples, Barley-Grewel, and the like things, abstaining from Flesh. I order them to sit up from Bed a little while every day, and to take a lenient cooling Clyster every day, and not to omit it for one day. Moreover, the fury of the blood is restrained, as if it were bound with a Chain, by a paregorick draught of *Diacodium* at the hour of sleep.

But when a sharp *Lympha* accompanies such hæmorrhagies, as it often does, which being mixt with the blood, helps its motion, by opening the Orifices of the Veins, it is customary with me, besides revulsion and cooling, to give a gentle Purge even in the height of the Disease, whose operation when it is over, I give an Anodyne, a little stronger than ordinary, and when the Symptome is utterly vanished, I give another Purge.

Spitting of blood also, which in the confines of Spring and Summer seizes Men of a hot constitution, but not of a very strong one, and whose Lungs are not in very good order, also young Men above old Men, is commonly of the same nature with Bleeding at the Nose, seeing this is also a Fever, which parts with its name as well as essence, at the Crisis in which it ends, onely with this difference, that in the former Disease, the blood being too much agitated, makes its assault upon the little Veins in the Nose, and in this, upon the Lungs: And as in that, during the Flux, Pain and Heat they continually pierce the Forehead, so in this, both of them beset the Breast, with a kind of debility. Moreover, this Ail challenges to it self the same method of cure in a manner, which Bleeding does, but that it will not so well endure Purging, upon which, especially repeated, the Patient is easily cast into a Consumption: But Phlebotomy often celebrated, a Clyster given every day, *Diacodium* given at the hour of sleep, Diet moreover, and thickning and cooling Medicines, will doe the work, as you would desire.

 The cure of a Hæctick coming from a semiputrid substance of some of the inner parts. XV.
 The Cure of one joyned with the French Pox. XVI.

I. Seeing in the beginning it is easily cured, but scarcely known, therefore a Physician should be very diligent in searching out the signs of one

beginning. *Sennertus* lays this down as an inseparable property, if an hour or two after Meal heat be increased, and the Pulse grow greater, and quicker, without cold or shaking, which are usual in Putrid fevers. The reason of the first Symptome is this; The Heat of Hæctick persons is fixt in the solid parts, wherefore little is excluded by them in form of Vapour: Whatever it is, upon the accession of moist meat, or subtile food, that is quickly distributed, it is increased by Vapours: Hence a small Sweat is strained out, and the Stomach is loaded with a certain compression, so as food is a trouble to it; that is, the Heat increasing, till there be a perfect distribution of the Aliment. But because it may so be, that in a Putrid fever, when no cold goes before, some exacerbation and increase of heat may follow a Meal, lest the Physician should mistake in his knowledge of a Hæctick, let him change the hour of his Meal for three days, and if the heat increase alike, the opinion of the Physician is confirmed.

II. Consuming fevers, yet without an Ulcer in the Lungs, may sometimes be cured, before they come to extreme Leanness, and if there be no hardness of the Liver or Spleen. The Man in *Oenadis* 5. *Epid. n. 2.* seems to have been wasted and consumed by such a kind of Fever; as also that Woman, from whom *Galen* took in three days 2 pounds and an half of Blood. And sometimes we have cured some of these Fevers by Bleeding, but never by Purging. We recovered a Boy about twelve years old, of a Hæctick fever, that had parched him for several months, and was beginning to have a Dropsie by repeated Bleeding and Purging with *Senna*: His Blood was most corrupt, that is, very black underneath, not concrete; above, very pale and tough, which swam upon thrice as much Serum. No Man more happily escaped a Consumptive fever by Bleeding, than Mr. N. After a Burning fever of twenty days he fell into a Hæctick, which had a nocturnal and putrid Fever, coming with a little Cold joyned with it: These had so consumed the Man, that you might have grasped either of his Legs, near the Knee, with your hand. I took ten ounces of most fæculent and very ferrous Blood from him: That very day his Putrid fever left him, the Hæctick continuing, which did him less harm: After eight days the like quantity of Blood was taken from him, out of the other Arm, which was very like the former: The Fever declined by degrees, and in three days left him.

III. Milk is prescribed by all Men, and deservedly: for Food of ease digestion is proper for Hæctick persons, because the innate heat is weak; and such as resists the febrile heat and driness, as Milk does. But if these qualifications be required in their Diet, Why are Crayfish also prescribed, which are accounted hard of Digestion? We must take notice that a two-fold Diet must be assigned to a Hæctick, according to the difference of time; For in one that is beginning, a grosser Diet and longer of Concoction is requisite, though it be concocted with difficulty, because at that time the native heat is stronger, and better able to overcome gross nutriment. If the Hæctick be far gone, and therefore the innate Heat, Parent of all Coction, be very weak, things hard of Concoction must be avoided, and those things given, which are digested without any trouble, and nourish well and quickly. Because the Heat being fixt in the solid parts, wastes much of the substance of the Body, which we must study to repair by thick and glutinous Aliment, but such as is also of a good Juice.

IV. Sometimes the more ignorant sort are deceived, who altogether forbid Milk, when Hæctick persons of the first or second degree are troubled with very small Obstructions of the *Hypochondria*, or with a slight Putrid fever: And in the mean time they

Botallus, l. de Sangu. missone, c. 17.

they do not see, that if Milk be not given, at least in a small quantity, they hasten to the third degree, whence follows Death. We say with Hippocrates, 5. Aph. 64. that it is bad to give Milk to them that have Obstructions, or are in Putrid fevers; But that it is far worse to suffer a Man certainly to perish: for we must have greater regard to the Urgency than to the Cause.

V. Hippocrates, 3. de viâ. acut. 54. writes, That it is not proper for him to bathe who is full either of Meat or Drink, lest crude matter be drawn out of the Belly into the Veins and Habit of the Body: Why therefore do the Physicians of our Age, if a spent Patient have but drunk Asses Milk, presently set him in a Bath? They will answer, To get it into the Habit of the Body: But we say, it will not be assimilated, when it is not concocted: Therefore that might better be done 4 hours after. And Hippocrates says, We must neither eat nor drink presently after Bathing; for when a heat is raised, the attractive virtue of the heat, takes away the opportunity of mitigating it. ¶ Yet Galen, 14. Meth. 15. 5. gives Milk to weakly persons after Bathing, and Trallianus gives Pissan.

VI. Galen also seems to confirm it, that Whey has its place in a Hæctick fever, when 10. m. m. c. 11. he says, that Asses Milk is proper above all other, because it is serous: Therefore Whey is most proper. ¶ Now I understand why Milk is due to Hæcticks, and the more serous, the more beneficial; and therefore Galen prefers Asses Milk before any other, not because it is colder, for upon that score Water would be more convenient, but because in Hæcticks the solid parts are consumed, which Whey, as it were their nourishment restores. For it is not the simple Vehicle of Aliment, as Antiquity deemed, but it self does nourish; for if it be set over a gentle fire, it grows thick, a most certain sign of Aliment. An Experiment of which matter being made an hundred times, I ever observed that the very Whey was not only thickned, but became glutinous and membranous, and hence I presently conjectured that the spermatick parts were nourished with Serum, &c.

VII. It must not be passed by, that 5 or 6 ounces of Broth of a small Chicken, when the Fat is taken off, may be beneficially given before Meal, that the solid parts may be moistened: So Plasterers sprinkle the Wall with water before they lay on the Lime, that it may stick the faster. Instead of this, some order Water to be drunk, but it is unfit to moisten the solid parts.

VIII. Galen, lib. de Marcote, and 10. Meth. greatly commends Water in the first sort, wherein the Humour only ferments, and is not as yet consumed, and while the Body, although it be hot and dry, yet abounds with Blood, and is full of Juice: For by the use hereof, Galen writes, he preserved many from a Marasmus and Consumption: And here Alexander's advice should be followed, who orders as much Cold water after Meal as the Patient will drink. But if a Hæctick happen from a Putrid fever, Crudity of Humours, or Inflammation of the Præcordia, drinking of Water ought to be avoided, especially if strength be low, the Inflammation moderate, and Coction do not as yet appear: But in a very vehement and urgent Inflammation, as an Eriphelaceous one, Cold water may be given, for the Inflammation will be extinguished, although the Disease be protracted a long time: But if a putrid one be joined with it, Coction must be expected: But in a Hæctick, which follows Burning fevers, or in a Marasmus it self, we must have a care of Cold water, lest in a fleshless and weak Body the innate heat be extinguished, over hasty Old Age brought on, which they call Age from a Disease, in which the innate heat is either none at all, or very little; therefore it requires not cooling but heating, moistning and restorative things.

IX. In the use of Coolers we must observe this, that the more powerfull be not immediately and frequently used; for they might extinguish a weak heat; and it is better to cool gradually than all on a sudden. But Moistners are ever safer than Coolers, because they perform their operations slowly.

X. Among external Remedies, a Bath of Sweet water is the chief; for it powerfully cools and moistens and relaxes the external parts, that they receive the aliment more readily: The use of it cold was most frequent among the Ancients, which is now grown obsolete, and not very safe; for there is fear that the Body might be hurt by the sudden meeting with Cold water: Therefore the readiest and most advised way were, to set the Patient in the Bath while the water is moderately hot, in which he ought to stay till it grow cold of it self. Observe, it is better to make them moistning by boiling emollient and cooling things in them, as Barley, bruised Almonds, &c.

XI. That the Patient may the better inure himself to the Bath, let him first of all try the steam, being wrapt in a Sheet, and being held by four lusty Men over the Kettle, in such a posture, as he may easily breathe, and the rest of his Body, that is wrapt up, may be sensible of the steam, through the Sheet. When this has been repeated several times, and the Man, after he has rested a-while, seems to have recovered his strength, let him be put in the water, and tarry therein as long as his strength will permit. Let the Servants take diligent care, that the Patient be tired with no stirring of his Body, but let them treat him so tenderly, that he may be at no pains, while either he rises out of Bed, or goes into the Kettle (near his Bed) or when he goes out of it, as he lies him down again. Nor do I see any reason, especially in this Age, why the Patient should be turned out of a warm Bath into a cold: Because Cold water ill affects the Nerves, not sufficiently fenced with flesh, nor should it ever be prescribed to any, but fleshy and young people, and in the midst of Summer (when it is good for this Disease.) It were better to anoint the Body with Oil of Roses, or of Water-lilies.

XII. Galen, 10. Meth. 11. propounds in the progress of a Hæctick a warm Bath, as he does a warm one, and then a cold one, when a Man is very weak and his Body thin and emaciated: which latter way of Bathing is more eligible, as it is safer, for the moisture is more easily insinuated in a hot Bath, and better kept, if cold water be presently poured on. Then, after gentle wiping and drying with soft cloths, we anoint with Oil of Almonds and Violets mixt together, anointing the whole Belly with ung. rosac. Mes. Besides, after a warm Bath, the distribution of the Aliment will be rendred much more easie: and it will be made much more efficacious, if it be altered with Leaves of Mallow, Violets, Water-lily, &c.

XIII. The Bath, as a thing that greatly moistens the whole Body, helps also very much the distribution of the Aliment, if it be done, when the Meat is digested, as presently after Meat it breeds Crudities, and after long fasting it weakens: Wherefore the Patient may be led to the Bath 3 hours after he has taken Milk. ¶ After Bathing one may not sleep, but rather take some sustenance: Galen therefore 14. Meth. 5. gives them that are weak Milk after Bathing.

XIV. Galen, 10. Method. cap. 8. in Summer time, when the Air is very hot, advises the Patient to live in some place under ground, which may be very cold, open to the Wind, and looking towards the North. With which Remedy alone I saw a Hæctick person, who was nothing but skin and bone recovered within a month. But when the Air is coldest, Galen advises to admit it, as it is drawn by respiration, which most cools the heat of the

the Heart; although it doe no good at all as it touches the Patient outwardly, lest transpiration be hindered: Yet we must note, that if the Hætick come from an Ulcer of the Lungs, a cold Air is not convenient on account of the Ulcer, but a temperate one in the active qualities, &c.

XV. There is a sort of Hætick that frequently occurs, which proceeds from a spoiled and semiputrid substance of the Lungs, Liver, or some other part; Some conflict with a slow Fever for 2 or 3 years, which is not known but by the Pulse after eating: This, because of the extenuation of the body, prevailing every day, and the diurnity of the Fever, is reckoned a Hætick by some: But yet it is cured by a moistning and cooling Diet, by Purging twice or thrice a month with Syrup of Succory, with Rheubarb, &c. and things that take off the hot and dry intemperature impressed on the Bowels. They that are thus affected are not troubled with a Hætick fever, but with a certain indisposition of the Liver, partaking of heat and dryness, implicated with obstructions of it and the Mesaraick Veins: Which obstruction keeps up a slow Fever, whence it comes to pass, that when the obstructions are opened and the hot and dry intemperature of the Liver altered, the Fever vanishes insensibly.

Enchirid.
Med. Pract.

XVI. If it chance that the Pox be complicated with an Hætick fever, you must presently take care to keep down the Pox, that the Fever also, together with the other Symptoms of the Pox may be removed, before the Patient become truly consumptive. And although the Atrophy of the whole may hinder the fulfilling of the intentions, yet this infers a difficulty but not an impossibility. And seeing this Quality is occult, it requires Alexipharmacks to extinguish it, which yet are not sufficient alone, but must be manifestly drying besides. Nor can it be taken away by strong Purges, as some have falsely imagined, and much less, when the solid parts are ill. Wherefore we must fly to the Pith of *Guaiacum*, as to a Sheet-anchor, and a safe Alexipharmack: which though it be hot and dry in the second degree, yet it is fat and oily, if it be but odorous, fresh and black: To which *Sassa* also may be added, as a thing which heats little or nothing, and attenuates and melts not onely congealed humours, but the dry, by softning them: *China* also may be admitted, to which notwithstanding we give little or no trust, because it quickly loses its excellent virtue. And let not the exceeding leanness of the whole deter us from the use of these things, when *Cardan* encourages us, who cured a pocky double Tertian, onely with the Decoction of *Guaiacum*: But *Scholtzius* more, who cured a pocky Consumption with a Decoction of *Guaiacum* and *Sassa*, as *Solenander* cured such another Hætick, which I have seen confirmed several times by my own experience. We must think likewise of the way how to doe it; for, I think, Sweat is necessary to attenuate, soften and carry off the putrid matter sticking in the solid parts: Therefore let a Decoction first be made, which may have a nutritive faculty: Take of choice *Sassa* 1 ounce, Pith of *Guaiacum*, fresh *China*, each 1 ounce; distilled Water of Sorrel, Borage, each 1 pound and an half. Mix them. Make an infusion for 24 hours. Then add half a young Chicken; let them boil gently covered, till half be consumed. Let the Colature be kept for 2 times, to be taken an hour before Sweat; Then take the remainder, leaves of fresh Endive, Borage, Sorrel, each 2 handfulls, pure Water 12 pounds, half a young Chicken. Boil a fourth part away. Then distill them in *Balneo Mariae*: for their usual drink. When an hour after eating is over, let the Patient sit in a Kettle full of hot Water, altered with Mallows, Melilot and Mercury or Pellitory of the Wall, and covered with Linen above: So let the Sweat be provoked, that it may not of-

send his Leanness, and that the putrid matter, infected with the Pox, sticking in the solid parts, and thickened, may be softened and melted, that so afterwards he may the better be carried to the Hot-house, which he must go into about 8 days after, yet he must make but little stay in it, and sweat rather in his bed, and when other 8 days are over, let him go into the Kettle, and let him prosecute it by turns for 40 days. This way of Sweating respects the Leanness of the body; and the infected matter to be carried off on a double account: Which, if it be thick, wants moistning, that it may be moved; and Phlegm it self, when it is thick, must also be moistned, that it may be rendered more tractable for motion and evacuation, as *Trallianus* observes, being so taught by *Galen*, who therefore gives store of drink to them that breathe hard: But because this putrid infection does perfectly indicate exsiccation, therefore it is necessary that the Patient sweat in a Stove by turns.

Febris Hemitritæus, Horrifica, or, An Half-tertian or Shaking Ague.

The Contents.

What the Preparation of the Humours should be? I.

How we may help the Inflammation that accompanies it? II.

When Wormwood is proper? III.

What Diet is proper for a true one?

Whether Herbs be convenient? IV.

I. IN Preparation of the Humours we must proceed in such order as that Bile may first be prepared and lessened, and then Phlegm; yet alternately and by turns, that as much Bile as Phlegm, because they are equally peccant, may be prepared and evacuated; But, which is the chief thing, Preparers of Bile and Phlegm must not be mixt together at one and the same time, as if the Humours were mixt, as is usually done in bastard Tertians, and as many mistaken persons doe; for these are two different and contrary Humours, putrefying in two severall places, which we cannot with one and the same Medicine, compounded of Heaters and Coolers, correct both at once. ¶ *Julepium Aletosum* is very proper, as it respects both Humours, it being a thing that turns Choler into Phlegm, and it into Choler.

Fortis, l. de
Febribus,
p. m. 27.

II. The common Symptoms are Inflammations, inward or outward, which we must help, neglecting all other things. And if this be internal, revellents, repellents and alteratives are proper; and therefore Bleeding, application of Subtypticks, and inward Coolers will be necessary. But if they be external, through the translation of the humours, or a *Crisis* naturally procured by their settling; Or, if the matter by reason of long sickness be attracted to some part, it must be diligently observed by the Physician, that he abstain from all Diversion procured by Bleeding, and Medicines, especially Purges; but they must insist on slight Preparatives, Alteratives and Clysters. In the mean time the care of the part recipient lies upon the Chirurgion, that the Inflammation turn not to a Gangrene, the innate Heat in the whole and part being weakened by a tedious Fever.

Idem.

III. Wormwood must not be given before Cognition, because it causes loathing, the Humours being moved in the Stomach.

Rudius, l. 3.
c. 23.

IV. A true *Hemitritæus*, to wit, a Continual Quotidian, and a Tertian between whites, requires a more subtle Diet than is proper for interpolated Fevers, but a grosser one than what is convenient for continual Fevers from one simple Humour, because

cause it is longer than any one of them. And since Nature has a dispute with two Humours contrary both in quality and substance, she stands in need of strength and time to conquer them both: therefore upon both accounts, namely, that she may continue a long time, and that she may have strength against both her enemies, she has need of more ample Alimony. We must mix therefore either such things as may repress the Qualities of the peccant Humour, together with the Meat, and of contrary Qualities, or we must use temperate Meats: One may not administer such things as respect onely one of these things; for the Physician must be carefull of both Fevers. I call that meat temperate which suffers onely from the natural heat: You may apprehend that this is not fit for them that are sick of a *Hemitritæus*; because the Blood must of necessity have a bad quality, which is bred of it in Fevers: for in the Tertian the part effective of the blood is out of its natural temper, that is, hot and dry, because of the heat and sharpness of the putrefying Bile: Wherefore temperate meat, by reason it suffers onely from the natural heat, and cannot by contrary qualities correct the intemperature of the part, will be affected with them, wherefore the Blood which will be bred of it, will grow hot and dry according to the intemperature of the part, which will in a moment immediately be turn'd into Bile. The like judgment may be given in a Fever which has its rise from Phlegm, that makes the Body preternaturally moist; wherefore things must be mixt with the meat which are of contrary qualities, or that must be taken, in which both qualities are found, which I rather approve; but if moreover it be incisive, it should be chosen before the rest. Vinegar is one of those simple Medicines, which is remarkable for the foresaid qualities: For it is good for both the Humours; moreover it is endued with subtle parts, whereby it cuts, but if you mix this with any thing that is absterfive, you have that which we require. Sugar is one of those things which is moderately absterfive, and is convenient for People in Fevers. Wherefore you may reckon that a mixture of Sugar and strong Vinegar, which Physicians have named *Syrupus Acetosus*, is very convenient for a *Hemitritæus*, which you may use in this manner; Take of Time, Parsley, French-barley, each 1 handfull; stoned Raisins 1 handfull, the Bark of one sharp Radish, a little Salt: Boil them well with a fleshy Hen: Take 1 pound of this Decoction, as much sharp *Syrupus Acetosus* as will make it palatable; let them boil till they are mixt; give him to drink when he ought. Make Broth of the rest. Use this before a violent fit, and in its declination; but on the more moderate day use the same, and give the Patient the extremities of the Hen.

Brûdus, de
Vidu Febr.
l. 3. c. 2.

IV. One of the Arabians in a *Hemitritæus* feeds the Patient with Gourds, Spinage, Orache and the like: But he is mistaken, as I think, upon a double account, Of the very Nature of the body, and Of the Meat it self. Cold Meats must not be given at the hour when Nature is intent upon separation, lest they oppose Nature and repel the periodick expulsion the contrary way, which is made from within outwards, and stop the Pores, by reason whereof the fit will be made longer, as is manifest to them that diligently consider the nature of Meats, and search what they are able to doe at all hours. Hereto you may add, the Meats which are made of Herbs are obnoxious to corruption, because they breed a watry Blood, which soonest conceives an extraneous heat. It is therefore the wisest way not to give Meats of this nature, when the corrupting cause is strong.

Idem, ibid.

Febris lenta, or, A Slow Fever.

It arises from an evil disposition of the Blood.

THAT is reckoned among Symptomack fevers, which is vulgarly called Slow: They that are sick of it, are hotter than they should be, especially after eating, any motion or exercise; The Urine, for the most part is red, the Spirits are low, and Strength decays; they are indifferent well as to their Stomach and Sleeping, they neither cough nor spit much; but they waste every day, like consumptive People, and without any manifest cause. The Blame is generally ascribed to obstruction of some of the Inwards, through whose fault, the Aliment is neither concocted nor dispersed aright. But it seems to me that such an affection is founded immediately in an evil disposition of the Blood, whereby it inclines to an over salt and sharp temper, and therefore is rendred less fit for nutrition and equal circulation: for the Blood in the Heart, just like Oil in a Lamp, if it abound over much with saline particles, burns not pleasantly and quietly, but with crackling and great evaporation of parts, whereby it is sooner spent, and yields but a languid and weak light. Formerly I opened one who died of this Disease, in whom the Bowels designed for coction were well enough; but the Lungs were sapless and dry, and were beset all over with a kind of fabulous matter like Chalk: And oftentimes in this Disease the Mesenterick Glands are full of such chalky matter. But whether the salt blood first caused such Diseases of the Bowels, or the Dificrasis of the Bowels first infected the Blood, is uncertain: It is probable that one of them depends on the other, and the causes of either Disease are reciprocal.

Willis, de
Febr. c. 11.

Febris Leipyria, or, A Fever wherein the inward Parts are violently Hot, and the outer Cold.

The Contents.

Hippocrates his Cure by applying cold things is methodical. I. The Leipyria of the Arabians must be cured one way, that of the Greeks another. II. Whether cold things may be given to one coming from a Malignant humour? III. Whether Broth may be given? IV. Cordial Epithems are hurtfull. V. The Diet in the Leipyria of the Arabians. VI.

I. THE Cure of this Fever proposed by Hippocrates, l. de affect. v. 107. (it is proper for this, saith he, to apply cooling things outwardly both to the Belly and to the Body, to prevent Shaking) at the first blush seems foolish enough, as it orders Coolers, that is, Medicines actually and potentially cold to be outwardly applyed, because they seem highly prejudicial to the hot Internals and cold Externals: for being applied outwardly they drive the Heat inwards, whereby the Disease increases. But this Remedy does not want its reason: for whenever a bilious humour, burning in the Internals, causes a refrigeration of the extreme parts, and not the penury of the innate heat, cold things applied outwardly can doe no harm; yea, if they be often applied, the cooling virtue being communicated from one part after another to the internal parts, they may extinguish the internal heat of the Bile. Nor need the retraction of the heat be feared, because much Cold applied all at once

C c

once

once causes it, not what is applied by little and little, and endued with no intense Cold, such as he supposes must be used in this case, while he orders Shaking to be prevented. I can confirm the Authority of my Master by experience: For I have observed People so affected, that the more we endeavour to reduce them to their natural state by hot things, the more violently they were cooled. Above all others I observed it in N. who being in a burning Fever, and very cold in his external parts, after they that were by had tried for a whole day to heat him with Flannel and warm Skins applied all over his Body; yet in the evening we found him colder than ever. The reason is, Because if such refrigeration proceed from the penury of the radical moisture and spirits, if, while we strive to draw the moisture and heat to the superficies by heating things, we dissipate and draw it out, what wonder, if the Body be thereby more cooled? And if for this reason hot things do hurt, for the same reason, what things soever can dissipate more than hot things, must be so much the more suspected; for example, Frictions and Cuppings, which are in frequent use for the Cure of these Fevers.

Prosp. Martianus.

II. Avicenna reckons a Leipyria among Phlegmatick Distempers, ascribing the rise of it to vitreous Phlegm, while gross Vapours are elevated from it when it putrefies, which cannot be carried to the external parts, and make them hot: Or, because there are cold humours in the external parts, which cannot be made hot by the heat of the Phlegm putrefying within. In the Cure of it he uses Symplicium Acetofus, Oxymel, both simple and diuretick, to cut and prepare the gross and cold humour: He purges with Aloes, Hiera and Rheubarb; and so in short he lays down the Cure of an Epistaxis. By Galen it is reckoned among Burning fevers, and these malignant, and he says they are caused by an Inflammation or Erysipelas of some of the internal parts. Hippocrates also reckons them among Burning fevers: But every Burning fever has not this Symptom, onely such as is malignant and pestilential. Galen referred it amiss to a Phlegmon or Erysipelas of the Bowels, for I have seen several Malignant fevers wherein the out parts were scarce warm, and the inner were burning hot; yet, there were no signs and symptoms of the Bowels being inflamed. Therefore in my judgment there is a twofold cause of this Symptom; the first is, seeing the Nature of this Fever consists in a malignant poisonous quality and putrefaction, and that it is the property of all Poison to lay in wait for the Heart, because Nature, that she may defend a noble part and assist it, sends blood and spirits from every place to the Heart and noble Parts, whence by accident such refrigeration follows: The second cause is, because this Fever is caused by humours very much putrefied, lodged about the Præcordia, such as cruginous Bile, very much putrefied, the meeting of which when Nature cannot bar, she endeavours to evacuate them by Vomit and Stool, and therefore strives to do it with all her force, and thereupon a concurrence of all the Humours inwards follows. Hereto, I think, may be added the peculiar property of the malignant humours, to incline rather inwards than outwards. Here we must first give a Clyster; then bleed, and then use Coolers and Cordials, as Juice of Lemons, Citron, Pomegranate: Cataplasms of Barley-meal mixt with Juice of Houleek and the like Coolers, must be applied to the Hypochondria, and often changed. Finally, the same Cure is owing to this Fever, as to a burning malignant, those things being added whose property it is to resist Malignity. And we must remember from Hippocrates, 2. de Morb. l. de Affec. that we use onely Broths, till the Fever is over; for Drink we must give small Mede; we must purge onely by Clysters, not by any other Catharticks, before the Fever is gone.

Primitivus, l. 2. de Feb. c. 8.

III. Alteratives are very requisite in this Fever, so that Paulus and Aetius have affirmed that drinking of Cold water is proper; yet not in the beginning, but in the state, that is, when signs of Coction appear. And although Aetius gave Cold water to a certain Woman, without tarrying for Coction; yet it was an improper Leipyria, caused by an Erysipelas in the Stomach, whose proper Remedy is drinking of Cold water, as Galen, 9. Meth. 5. teaches. But in this case more willingly chuse some Alterative, which may not by its quantity oppress the innate Heat, but has a cooling and moistning virtue; such as are distilled Waters of Juice of Sorrel, Cichory, yea, and Water melon, which may be given to a pound and a half, adding 3 or 4 ounces of Scorzonera-water: Which Potion may be given 5 or 6 hours after the beginning of the Fever.

Fortis, l. de Febr.

IV. But that Heat may more easily come to the external parts, or at least that the Bowels may not be so grievously suffocated and afflicted thereby, it will not be amiss 3 hours after the beginning of the Fit, to give, not indeed Broth altered with Citron-feed, as it uses erroneously to be done, for nothing then must be offered which has the nature of Aliment; but 3 or 4 ounces of Cordial-water of totius Citri, Scorzonera, and Sazonie, may by and by be given, as was said, after some altering Potion, and then the Broth 2 or 3 hours after that; namely, of something altered with Cichory, Borage, Endive, Cinquefoil and Tormentil, adding Syrup de acido Citri, of Juice of Lemons, and a convenient portion of some altering Broth.

Idem.

V. It is an Errour in Physicians, who, when in Continual fevers the out parts are either cold or but warm, do presently flye to Cordials without distinction, applying Epithemes to the Heart, and giving other things which may produce much spirituous substance, by strengthening the action of the Heart. Which indeed in the refrigeration of the extreme parts, by reason of the internal heat calling the Blood and Spirits to the inner parts, are so far from doing any good, that they do a great deal of hurt: For, if we consider the Applications, they offend in two things; first, because they use things actually and potentially hot, whereas they should be actually and potentially cold: Secondly, because by their means the spirits are increased in the inner parts, which should be diminished: For while the vital spirits, that are diffused all the Body over, are by the virtue of the heat conveyed inwards, they so abound there, that there is imminent danger of the suffocation of the heat: And this abundance of spirits is made manifest by great and quick Pulses, which, when the spirits are deficient, appear small, rare and intermittent. Wherefore to endeavour the generation of spirits in these, is nothing else, but to bring an imminent danger of suffocating the vital spirits in the Heart, to a certain extinction of the innate heat. Wherefore we must then onely endeavour the generation of vital spirits by the foresaid Medicines, when the spirits fail, which we may know by the Pulse. Therefore the said Cordial Medicines must onely be used in that refrigeration, which derives its original from immoderate dissipation, and corruption of the spirits.

Prosp. Martianus.

VI. Seeing this Fever (the Leipyria of the Arabians) comes from one simple humour, as from a very gross Phlegm, which putrefying cannot warm the extreme parts, either upon the occasion of its thickneis, or small putrefaction, we must have recourse to Phlegmatick fevers, or Melancholick or Choleric, for the choice of a Diet: for it is the opinion of Learned Men, that it may have its original from each of these humours aforesaid. Wherefore the Arabian said well, You ought not (says he) to look to the Fits; for it may so be, that it may be a Quotidian, Tertian, or Quartan, or may have its period on the fifth or seventh day.

I. I Think all that Malignity, which is found in epidemick Diseases (what such soever the specifick Nature of it is) does consist of, and is terminated in the hottest and most spirituous Particles of the Humours contained in Man's body that are more or less adverse to Nature; because onely such a sort of Particles are able to alter the Humours so suddenly as we see in Malignant Diseases. And, I think, those hot and spirituous Particles do act most by assimilating, seeing by the Law of Nature every active Principle makes it its business to procreate its like, and to bend and accommodate what things soever resist it, to its proper disposition: So Fire generates Fire, and one infected with a Malignant Disease infects his fellow, to wit, by emission of Spirits, which assimilate to themselves the Humours, that are presently infected, and lead and draw them to their own nature.

These things being premised, it certainly follows, that nothing can be better, than to cast out the said Particles by Sweat; for by this means the Disease may forthwith be utterly extirpated: But here Experience gainsays, and teaches that this cannot be done in every sort of Malignity. For although in the Plague it self the pestilential particles, both because

they are very subtil, and also because they reside in the most spirituous part of the blood, are dissippable, and may be cast out by raising an uninterrupted Sweat; yet in other Fevers, where the assimilating particles are not exalted to that Subtily, and also are incorporated with the grosser humours, the malignant matter is not onely incapable of being thrown off by Sweat, but is often increased by Diaphoreticks wherewith Sweat is raised. For by how much more these hot and spirituous particles are actuated by the use of heating things, by so much the more is that assimilating faculty, which they have, increased; and by how much the more these Humours are heated upon which they act, so much the more willingly they turn to the Assimilants side, giving way to their impressions. When, on the contrary, Reason seems to dictate, that those Medicines which are of a contrary nature do not onely stay the violence of the hot and sharp Particles, but also condense and fortifie the Humours, that they may be the better able to sustain the assault of the morbidick Spirits, but also break it. And here I must appeal to Experience, by which I am taught, that the Purples in Fevers and the black Pustules in the Small-pox increase the more, the hotter the Patient is kept; but that they usually decrease and grow less, upon a more moderate Regiment, which is altogether proper for them.

Now if any one ask me how it comes to pass, seeing the Malignity consists in such hot and spirituous particles, that frequently so small signs of a Fever appear, even in the most malignant Diseases? I should answer the Enquirer, First, that in the principal and most remarkable instance of Malignity, it is abundantly manifest, that the morbid particles are above measure so subtil and aculeated (especially when it begins first to invade) that they get into the blood like an Air, and blasting as it were its Spirits, they do not so much as raise it to an Ebullition, whereupon the Patient dies without a Fever.

But in that less degree of Malignity, which is found in other epidemick Diseases, the febrile Symptoms are rendered thus little conspicuous, sometimes from a confusion raised in the Blood and Humours by some inimicus Particles contained in their mass; whereupon Nature, being as it were oppressed, is unable to exert those more regular Symptoms, that are proper for the Disease, but they are all of them in a manner anomalous *Phænomena* by reason of the Oeconomy's being utterly overthrown and ruin'd; in which case the Fever often is low, which, the genuine duct of Nature obtaining, would be very high. Sometimes also fewer signs of a Fever shew themselves than is natural for the Disease to do, through a translocation of the morbid matter either to the nervous kind, or to some other parts of the Body, or to some humours without the liberties of the Blood, while the matter that caused the Disease was yet turgid.

But whatever it be, I cannot so much as guess what other method of Cure can be used for any Malignity, beside that which is proper for the Epidemick Disease, in which it is inherent. So that whether the Epidemick Disease be of the number of those which require first a concoction of the febrile matter, then a casting of the same off by Sweat when it is rightly disposed; or of them that seek a way for themselves by some Eruption; or of them that require a way to be opened for them by Art; in each of these kinds I say, Malignity, the Companion of the Disease, will stand or fall with the Disease it self, enjoying the same fortune, and departing in the same pace; and by consequence, whatever evacuation is proper for the Fever in general, the same is due to the Malignity; how contrary soever these evacuations be one to another. Therefore for that Malignity which accompanies autumnal Agues, as also a continual Fe-

ver, which is of the same nature, Sweating will be a Cure, which follows Concoction as its effect. A seasonable ripening the little abscesses will help the Malignity of the small Pox, and so of the rest, in all which that peculiar sort of Malignity is best conquered by those methods and means especially, to which the peculiar Diseases whereto it belongs, do most easily give way, whether you proceed in this or that method. Reason tells me this, unless I am mistaken: and Experience also strongly confirms it.

Sydenham.

II. There are several Differences of Malignant fevers: And we cannot determine from what cause they come unless we distinguish the Differences, and then inquire into their Remedies severally: Farewell therefore those Physicians, who endeavour to bring one cause for all these Fevers, when there are as many causes of Malignity as there are differences. Therefore the Physician, that he may find a Remedy, ought first to find out the specifick Causes, and from them a specifick Remedy. I find 8 Opinions, and mine is the ninth. 1. Of *Montanus*, who thinks the Malignity of fevers proceeds from putrefied humours in the Heart. 2. Of *Fernelius*, *Saxonia*, &c. who ascribe them to a poisonous quality. 3. Of *Capivaccius*, who thinks they may proceed from alimentary humours putrefied in the Heart. 4. Of *Fracastorius*, who derives it from a sordid and profound Putrefaction. 5. Of *Augenius*, who thinks it proceeds from Putrefaction with Corruption. 6. Of *Eustachius Rudius*, who says, it arises from violent Putrefaction, little differing from poison. 7. Of *Joubertus*, who believes that in them and Pestilential fevers the Blood putrefies, in other Putrid fevers it is onely kindled and inflamed. 8. Of them that think it is caused by some inward Gangrene. 9. Our own, that it may come from any of these Causes. The first Opinion may be defended from *Galen* himself, 1. *diff. feb.* 4. who holds that Pestilential and Malignant fevers come from humours putrefied in the Heart, or from putrid steams without the Heart, but affecting the Heart. The second Opinion is confirmed from *Galen*, 3. in 3. *Epidem.* in his fourth History of a Patient, who presently died frantick, as if he had taken a deleterious Medicine: Besides, seeing there is a Pestilence without a Fever, Malignity is not always caused by Putrefaction, for by how much greater the Putrefaction is, so much higher is the Fever. The third may be defended, because in a Malignant fever the Strength presently decays, which signifies that the Aliment changes its form, which change is usually made by Putrefaction. The fourth, fifth and sixth opinion, may be defended with *Galen* in many places, especially 3. in 3. *Epid.* and 1. *de diff. febr.* cap. 5. where he says that Malignant fevers are caused by Putrefaction. The seventh Opinion may be defended, because when the Blood is putrefied, the strength suddenly decays; where the decay of strength is a Character of a Malignant fever. The eighth is proved, because several times upon opening Bodies that died of a Malignant fever, I have found a small, very black Gangrene in the Liver. In this Case these 3 signs, propounded by *Galen*, 3. *de prasag. ex pulsibus*, are observed, 1. The similitude of the Pulse to a natural one. 2. Urine like that of men in health. 3. Want of a Fever, in the Judgment of the Patient, but some grievous Symptom attending.

Sanctorius,
de rem. inv.

III. Although a Malignant fever with *Exanthemata* come of thick Blood, Malignity putrefying; yet it is not so always, but, like most other Diseases, takes its difference from the matter, which is sometimes pituitous, sometimes bilious, and sometimes atrabilarious, according to which the cure varies. And sometimes there is a redundancy not so much of gross, as sharp humours, which Burning and Watching do indicate (for they who have Phlegm mixt withall, are oppressed by a Coma.) In such cases

it is the worst thing that can be to use Treacle, or Decoction of hot Herbs, how Alexipharmack soever they be, as of *Dittany*, *Scabious*, *Carduus Benedictus*, which yet are very usefully prescribed to Patients sick of the like Disease.

Vallesius.

IV. Bleeding is very convenient upon the account of the greatness of the Disease, hot intemperature and putrefaction: But there is need of great prudence in measuring the Quantity, seeing upon the account of the Malignity it rather does harm, for the vital faculty is much prejudiced by it, and they who upon taking Poison do bleed, usually dye. Therefore if the poisonous quality prevail over corruption, Blood must be taken away in less quantity, if Putrefaction prevail, in a larger: And to especially, if it arise from a morbid apparatus and putrid humours gathered within the Veins: and that chiefly, if there seem to be or to be imminent an Inflammation of some of the Inwards, which often happens. But Blood must be let betimes: For if the Disease have made any progress, and the Malignity be diffused into the whole mass of Blood, it does not onely do no good; but also greatly weakens Nature; so that most Authours think Blood must not be let, when the fourth day is past: Yea and seeing at different times they are of a different nature, arising from a different degree of Malignity, we must observe diligently what emolument Patients receive from Bleeding: For some sort of Continents, wherein the Putrefaction is more intense, and the Malignity more remiss, do abate much by Bleeding: But others, whose Nature consists in Malignity onely in a manner, are made more pernicious by breathing a Vein. Concerning the time and intervalls for repeating Bloodletting, observe that, if the Disease proceed slowly, Bleeding must not be accelerated; for the strength is spent before its time, and will not be able to hold out the whole Disease. Therefore as the Disease moves so Bleeding must be celebrated sooner or later.

Riverius.

V. It is determined by the wise Judgment of Doctors, that when Purple-spots appear, in the beginning of the Disease, and at those days when Bleeding uses to be celebrated, if a sufficient quantity of Blood have not been taken away before, even at that time Blood may be taken away in a moderate quantity, without any imminent danger: Seeing that Eruption, which is in the beginning of the Disease, is not Critical but Symptomack, arising from the exceeding Ebullition of the Blood and the ferment of malignant and putrefying humours: And therefore Nature's motion, which at that time is not, cannot be hindred: For if, when the Body is plethorick, and sends out a thick and red Urine, you do not let blood on the score of Spots appearing, Nature will scarce be able to conquer so great a quantity of Humours, and there will be danger lest they fall upon some inner part, and breed in it a pernicious Inflammation; yet, at that time Blood must be taken away with greater caution and in less quantity, not that the Veins may be very much emptied, whereupon a retraction of the Humours from without inwards might succeed, but onely that their too great fullness might be removed, which being taken away, the Veins do not attract new Blood, but they fall flat and grow a little frait, that they may be the better able to contain and rule the Blood that is left in them, and so the motion and expulsion of Nature to the superficies of the Body is helped: For Nature being eased of part of her burthen wherewith she was oppressed, expells the rest more easily. Which is well known to us in our practice, whilst often on the same day we open a Vein in acute Fevers, yea sometimes within a few hours after Bleeding, we observe plentiful Sweats, and those critical and wholesome, to break out; Yea and although Nature were strong enough to rule all the redundant Blood, seeing in Plethorick Bodies the Blood is usually

usually thick, and by such efflorescencies only the thinnest portion of the Blood exhales, the thicker Blood remaining would only putrefie more and more, and would render the Disease far more dangerous. Yet I think it most advisable a little after Bleeding, to apply several Cupping-glasses, to help the motion of the Blood outwards. In short, if this happen in the beginning of the Disease, and before the fourth day, at which time there can be no critical Eruption, if no relief follow upon it, but all Symptoms rather grow worfe, bleeding should in no wise be hindred: If after the fourth day a great quantity of Spots break out, the Patient be better, and Symptoms abate, instead of Bleeding several Cupping-glasses with Scarification may be applied, that Motion may be promoted outwards. And what has been said of Bleeding, understand it of bleeding in the Arm, which immediately abates the Quantity. Sometimes notwithstanding opening the lower Veins is very beneficial, if the strength be not able to bear farther blood-letting. It is beneficial especially to Women, even beyond the time of their natural Purgation: It is good also where a translocation of the humours to the Brain is feared. Opening of the hæmorrhoids also with Leeches does good, which is done with little loss of strength, revulsion in the mean time being made from the inner bowels, it is good especially for Melancholick persons.

VI. This generous Remedy ought to be administered immediately in the very beginning of this Disease, that is, while strength is good, and before the corruption and poison is got into the Blood. Yea, I prefer this one thing, that there is no Fever, in which relief is deferred with greater damage: nor perhaps is there any one Fever, which more deceives ignorant Physicians; For when Bleeding is deferred, the Blood being already corrupt, I have observed that the cure is rendered almost impossible, by reason of the great weakness which appears all on a sudden before the height of the Disease. Furthermore, if any Disease can deceive a Physician, this is the principal, because this Fever at the beginning appears so mild, both in heat, and in all its accidents, that ignorant men slight it. But then afterwards signs of Death appear all on a sudden: for which reason it is necessary that the Artist be experienced, carefull and Learned.

VII. I think Bleeding in the lower Veins is far more beneficial than in the upper, especially if the *Menstrua* be stoppt, or the usual bleeding of the Hæmorrhoids suppressed; for in these latter cases it has no difficulty: But if they be wanting, I have observed in these Fevers, it is far safer to breathe a Vein in the Leg or Foot: For if it be the best way to draw the Poison from the Heart, no safer way can be thought on, than to draw to the lower and weaker parts. But some may say the abundance is not evacuated with that celerity out of the lower Veins, as out of the higher. I answer, 1. I cannot easily admit that, because, if I be not mistaken, the Veins of the Legs and Arms are equally distant from the *Vena Cava*. 2. Suppose there be a difference, it is exceeding small, but the utility, for the foresaid Causes, is far greater.

VIII. *Aquapendent* says, he will propose a Paradox, that evacuation by the Hæmorrhoids conduces more to the cure of Malignant fevers, than Bleeding in the Arm. He subjoins a reason: for the greater branches of the *Vena Cava*, wherein the peccant matter lies, may so be emptied. And I add, that while they draw from the sedal Arteries, it is very likely the Heart is wonderfully relieved thereby.

IX. Opening of a Vein may be omitted, when the strength is low, and there is no fulness of blood, or but a very little, and when it consists of the thinner part of the blood. Then, because the whole Body cannot be evacuated by opening a Vein, for

these contraindicating Causes, I should admit the use of moist Cupping glasses; by which we might advantageously evacuate that virulent Caco-chymie, which is mixt with the thinner blood.

X. In the Year 1648. an Epidemick, Malignant, Spotted fever raged, with great destruction, in which I often observed, that the frequent application of dry Cupping-glasses, and of Vescicatories, to the middle of the Limbs, and behind the Ears, did much good, even in desperate persons, and such as had a Lethargy or a Phrenzy. But if the heat or motion of the blood were over high, then you were to abstain from cupping and scarifying; for they were mortal, but the use of Cordials was very advantageous.

XI. It is the way of the Italians to apply Cupping-glasses to the lower parts, for revocation of the poisonous matter from the Heart to the most distant places: To the Shoulders and Back by no means, lest it be drawn towards the Heart from other places. But they are properly applied to all these places, beginning at the lower parts, for the foresaid reason: Which application, since it does not sufficiently draw the poisonous humours and vapours from the heart, and neighbouring parts, therefore it is of necessity made to the shoulders and back. Hear *Mercatus* his Opinion of them; *It is most advisable to scarify, where you set the Cupping-glasses to the Back, over against the Heart. Which Invention Practise has often shewn to be of such moment, that I have seen anxiety, inequality of the Pulse, and other most cruel Accidents, presently cease thereupon: Wherefore till you find the accidents of the Poison in some sort to abate, you must not leave off Cupping.*

XII. I had a Porter under Cure of a Burning, Malignant fever. When he was in great anxiety, I ordered Leeches to be applied to his *Anus*: but either through the negligence of the Attendant, or the ignorance of the Patient, they were set to his Paps, which falling off full of blood, gave occasion to copious blood-letting. When I came, I found the man recovered of his Disease, and I ascribed his succeeding health to this Remedy.

XIII. When one has been sufficiently bled in the Arm, opening a Vein in the Forehead is proper: he may bleed 6 ounces. Leeches may also be set behind the Ears, which indeed are an usefull Remedy, but not so effectual as the former, because the thinnest part of the blood only is drawn by the Leeches, when by a Vein of the Forehead sometimes in a Phrenzy more impure and corrupt blood is drawn, than from the Arm.

XIV. Vescicatories are condemned by some. 1. Because they encrease heat and burning. 2. Because by intervention of Pain they cause Watching. 3. Because they often hinder the critical motion of Nature to the Nose. I answer to the First, That they cause heat onely in the external parts, whereby the internal heat is abated. To the Second, That Watching and Pain come of themselves. To the Third, That they do not divert Nature from any wholesome purpose, because she endeavours no critical motion. But indeed they are necessary. 1. That the heat which is almost stifled may be refreshed. 2. That the poisonous matter, that is about the heart, may be attracted. 3. That the raging matter, rapt to the heart and brain, when it has a great urgency, and causes a *Delirium*, and makes the Pulse low, may be retracted to parts far distant. Vescicatories doe all these things as a present Remedy.

¶ Being taught by experience, I judged it a proper Remedy in this case, because I observed the internal heat was very great, when the out parts were cold, and most grievous symptoms of the principal parts were imminent, by reason of the malignant Evaporations of the boiling blood. By this means Revulsion is made to the out parts, in which respect the Physician imitates Nature, which uses to transfer Spots, Bubbles and Carbuncles, to the out parts in Pestilential fevers. ¶ Vescicatories applied to several

several Parts, do powerfully draw and make revulsion of the bad and poisonous *Ichores*. They are commonly applied to the hind part of the neck: for there they draw out the poisonous matter, and derive it from the head, and serve to cure comatous affections, which frequently happen in these Fevers. Yet where a great Malignity has seized the whole Body, and very cruel Symptoms are urgent, one is not sufficient, but several must be applied. In an exceeding severity of a Disease, I use to apply them to five places, namely, to the Neck, each Arm on the inside, between the Elbow and Shoulder, and to each Thigh on the inside, between the Groin and Knee, with good success.

Riverius.

XV. What Issues, Sores and Vesicatories are able to doe in preventing and curing Malignant Diseases, yea the Plague it self, has been already in some measure known since *Galen's* time, and is worthy of a more exact enquiry. In our climate, where the humours are for the most part gross, phlegmatick and dull, sometimes we observe present relief from Vesicatories, especially if they be applied before the seventh day of the Disease, to the inside of the Arms and Thighs, where the large Veins run. Yet there is a time when they are applied whole months to no purpose, yea sometimes in a whole year no sensible relief is found from them. The reason may be drawn from the difference of the Infection: When these Malignant particles stick not very fast, and do not embrace the tenacious moisture of the Body, they are more easily discharged by a Vesicatory, and the fugacious poison departs as the *Serum* breaks out: But when they reside in viscid matter, or are closely joined to any smooth matter, they commonly elude the force of a Blister. But how shall we know in what particles the malignity resides? To consider the constitution is not sufficient; for I have sometimes observed, that Vesicatories were very beneficial to phlegmatick persons, and that they have done no good at all to extreme choleric Men. They must be applied in season, especially when it appears by examples, that they have done good to others who have been sick in the same manner, near the same time. But if they fail your expectation, you must persist in Alexipharmacks, which must nevertheless be made use of.

Olaus Borrichius, *Alg. Danic.* 1676. p. 77.

¶ Since it is the ill custome of several Physicians, when Malignant fevers do rage much, if there be Head-ach and *Delirium*, to rely much upon the application of a Vesicatory, that I might be certain of the success, I enquired of several Chirurgeons, from whose report I understood, that most Patients died, to whom they were laid: And indeed I knew several who were so precipitated into their Graves. A plethorick young Woman, afflicted with a Continual fever, and Pain and a *Delirium*, by the advice of a young Physician, who made her a long discourse of the benefit of Blisters, had a Vesicatory applied to her Neck; a little while after she began to cry out and complain of a huge burning in her Head, and the next day she died of Convulsion fits. If a Lethargy or Drowsiness come upon one, to awaken him, and draw the matter from his Head, I think they should not be rejected; but not in the beginning or increase, when all things burn and are in a flame, and the Head is onely affected by consent with the lower parts. If one or two escape it is not so much by means of the Vesicatories, as of Nature or other Medicines.

Augustinus Thierus, *L. I. Obs.* 20.

XVI. It is much controverted among Practitioners. Whether one may purge in the beginning of Malignant Fevers? Many deny it, because of *Hippocrates* his rule, *Concocted not crude things must be purged*. And because in this Disease Malignant humours are too much stirred by Purgatives, they spread the Malignant quality farther, and sharply stimulating Nature, they cause a pernicious Looseness; when otherwise colliquating fluxes are usual in these Fevers, and for the most part mortal. Others con-

tend, that sometimes there is so great a quantity of bad and poisonous humours in the first ways, that unless it be quite taken away or diminished by a purge in the beginning, it will infect the rest of the mass of humours, that it cannot be conquered by Nature, how much soever she be fortified by Alexipharmacks. I think, in the beginning of this Disease we should abstain as much as can be from purgatives, for the reasons alledged before, and we should carry off by Clysters rather than by a Purge. Yet if the *Cachymie* in the first region be so great, that it is not likely it should be sufficiently carried off, the filth stagnating in the first ways, by frequent Clysters (which happens especially, when bad humours redound in the Stomach, and when there is a great loss of Appetite, bitterness in the Mouth, Loathing and Vomiting, or when there is store of Worms) it is the best way then to carry it off by a Purge, that the morbidick matter contained in the Veins may afterwards more commodiously be subdued, which matter indeed cannot be carried off before Concoction, and in this case onely *Hippocrates* his rule holds good, that *Concocted not crude things must be purged*. But the matter contained in the first Region, and the filth of the Excrements may be carried off, without any preparation or concoction premised.

Riverius.

XVII. As the giving of Clysters is not onely useful in the beginning of the Disease, but in the whole course of it, if the Belly be not loose of it self, that the daily excrements may pass, and some share of the morbidick matter may gradually be carried off, and that revulsion of the humours tending upwards may be made; so they become hurtfull, if purgatives be put in them, because they cause loosenesses, which are familiar to this Disease. They should be instead of an inward fomentation, not of a laxative Remedy. And although through the whole course of the Disease the Belly be loose, yet we must not leave them off, but use moderate Deterfives and Coolers.

Idem.

XVIII. I may safely say, that they throw Oil in the Chimney who give strong Purges in Continual fevers, especially where there is but the least suspicion of Malignity. Let the Doctors of Practical Physick be consulted, and their Observations, and you will be informed, that they that are sick of a Malignant fever, are for the most part unhappily purged, or you will find but very few of them that are unluckily purged, to be saved, and then it is by the strength of Nature. Nor according to Nature can it otherwise be, for what is purging but an artificial troubling and fermentation of the humours? as *Sennertus*, *Instit. Med.* 5. cap. 11. teaches. For what is a Continent fever else, and other fevers also, but a fermentation or ebullition of the Blood? And do you not finely cure the ebullition of the Blood by the fermentation of a Purge? It is quite contrary, seeing we must doe our utmost to stop this growing Malignity in a Continent fever, by reason of the fermentation of the Blood. And they doe far better for their Patients, who, at the very beginning of the Disease, order them immediately some approved, but not too violent Purge, with respect to each individual. Among whom let *Rulandus* appear first, who c. 6. de *F. Ungar.* says, *They that are easie to vomit, and whose strength is good, are sooner freed from the source of the Malignity, and are in less danger of the Cruelty of the Plague, when they have taken a Vomit; for by this the bad mass of humours is carried off, which for the most part gives a beginning to the worst Malignity, (witness the Heart-burn, tormenting most people) without any great loss of strength, and with less exagitation of the humours, than from the mildest Purges.* Let the famous *Hartman* follow *Rulandus*, who *Prax. Chymiatr.* p. m. 389. says, there is not a more successfull way found to cure Fevers, than that which begins with a Vomit. *Crato*, Physician to three Emperours, *Conf.* 275. commends the white flowers of Antimony for that purpose. And I must ingenuously confess, that as from the beginning of my

S. Pauli,
Digres. de
Feb. Malign.
Sed. 72, 75,
& 76.

my Practice I have ever been averse to *Gilla Theophrasti*, *Mercurius vita*, and such like strong Vomits; so with *Aqua benedicta Rulandi*, and with *Oxyssacharum A. Sale*, I have quickly, safely and pleasantly, several times cured both Tertians and Malignant fevers.

XIX. When there is loathing, and purging will do no good, according to the inclination of the humour, let Vomit be provoked by Art, to the end, that the impurities not onely of the first, but of the second and third regions of the Body may be cleansed. For if the Stomach, according to the Nature of the Sea, give to all, and receive from all, *Hip. 1. de Diet.* If by means of the Liver it be joined to all the parts of the Body, and receive their Excrements, according to *Galen's Doctrine*, and in a word, if the whole Body and the Stomach give and receive one from the other, *ex lib. 4. de morb.* who sees not that the most remote parts may be rid of the load of vexing humours by the Stomach? Nor is it amiss observed by *Aristotle 4. Probl. 7.* that very Weariness is cured by Vomiting, although the matter of it be far dispersed through the musculous kind. And especially soporated Patients awake upon taking a Vomit, whether the *Cataphora* be sympathick from the full and fuming *Præcordia*, or Idiopathick from the Brain being inebriated with the multitude of humours: for while the Stomach is rent with the Vomit, the Brain also is provoked, and by the common shaking and contention, the mass of humours oppressing both these parts is discharged: To these Reasons the Experience of several People in Fevers consents, who being slain into a *Cæcus*, incurable by other helps, have, by causing a Vomit, as by a Divine Wand, been recalled from the jaws of the Grave. But the question is concerning the choice of a Vomit, for some traduce *Stibium*, how artificially soever prepared, as *Stygian*: Others again adore the Infusion in white Wine, as the most august *Palladium of Apollo's Art*, on which all their hopes rely. *Hippocrates* in procuring a Vomit did very much use white Hellebore, which is poisonous and strangling; but since its correction is unknown to posterity, we have no reason to reject Antimony, as a safe *succedaneum* to it.

Menj. tuius
Dissert. 11.

XX. You will say, For what reason do Physicians, and especially Germans, give sweating potions immediately in the beginning of the Disease, when there is a thickness and crudity of the humours, and that to the manifest ease and relief of the Patient? I answer, That their intention is to draw out onely the ichorous part of the Blood, in which, as in the principal Subject, the Putrefaction is founded. For seeing the *Ichor* stagnates in all the Veins, even in the capillary, being mixt together with the Blood for penetration sake, as its conductor and inseparable companion, it is certainly most readily expressed and transcolated through the Skin by Sudorificks, because of its thinness. But do not think that they so relied on Sudorificks, as to abstain from all other Physick.

Joseph de
Medich.

XXI. Alexipharmacks must be very much varied and mixt, according to the various degree of Malignity or putrefaction, according to the different intenseness or remissness of the Fever, and the different Complexion, Sex, Age, and other Circumstances of Patients, left to the Physician's prudence. I onely will give you this caution, when the Fever is most violent, you must insist chiefly on Coolers and Acids, avoiding things hot and diaphoretick, which are proper, when the Fever is more remiss, and the malignant quality gives the most trouble. Alexipharmacks of the third class, Diaphoreticks, to wit, and Sudorificks must not be given but in the state of the Disease and declension, except some poisonous quality seem to prevail over the Putrefaction, chusing such things as are least hot. And there are various degrees of them: for some are hotter, as *Angelica*, *Zedoary*, *Dittany*, Treacle, Treacle-water, which should never be given, when the febrile heat is at the height, but then onely when it

is very remiss, and signs of Malignity very prevalent: But other things are indued with less heat, as *Scabious*, *Carduus benedictus*, Meadow sweet, *Scordium*, which may safely be given even in the height of the Fever. And these things should especially be distinguished in Practice: If the violence of the Symptoms be great, new Treacle may be convenient, because of the strength of the *Opium*, as yet prevailing, whereby the violence of the Symptoms is assuaged, and the heat of the humours restrained: Two grains also of *Laudanum Opium* mixt with Alexipharmacks, especially in the beginning or increase of the Disease, where Treacle is suspected, is very good: for by its narcotick and fixing virtue, the boiling Spirits, which are noisome to the Heart, are as it were coagulated, and the morbidick matter (which, while it is in flux, is most destructive,) is stopt, and remains in a manner unmoved; that afterwards Nature being not provoked, having gathered strength, may more easily apply the virtue of Alexipharmacks to her self. And a Physician should have divers Alexipharmacks in readiness, and should change them by turns, lest Nature be too much accustomed to one and the same thing constantly used, and should elude its virtue. Besides the nature of the poison is not always one and the same, but is very different according to the variety of Bodies, so that what does one good, will doe another none. If at any time Nature being oppressed and in a manner conquered by the malignity of the Poison, is able to doe nothing, but submits her Neck, as if her Hands were bound, any the strongest Diaphoreticks may be given in a larger Dose, that the depressed strength of the Heart may be quickened as with a Spur: Then Treacle-water or Bezoardicks, and such as are powerfull, and have a more penetrating virtue (which may be encreased by the addition of Camphire) must be used.

Riverius

XXII. Our modern Innovators, who endeavour to proscribe Gems, Pearl, Corall and all Cordials in general from medical use, and who cure all Fevers, even the malignant, onely by Bleeding and simple cooling Juleps, may be convinced at least by this experiment about Corall and Pearl, because if they be raduced to powder, and infused in Vinegar, juice of Lemon, Spirit of Vitriol or *Aque fortis*, they take away the Acrimony of these Liquors: Whence we may see that the same Medicines taken inwardly, do assuage the Acrimony and Malignant quality of the humours, and reduce them to a moderate quality. They that have tasted solutions of Pearl or Corall, made in juice of Lemons, &c. know this very well.

Idem.

¶ Here the futility of several Physicians must be reproved, who therefore vaunt the virtue of Pearl and Corall, for sweetening, as they talk, the churlishness of the Humours, because Vinegar, when a dissolution of them is made therein, grows sweet: For it appears, that the salt wherewith the dissolvent is imbued, is united to the Pearl, and the Liquor indeed is left sweeter, but the dissolved Pearl is made so sharp by the addition of the Salt, that after precipitation they stand in need of carefull ablutio. Suppose therefore the Stomach be infected with such Dissolvents, and that, after the dissolution of the Pearl that is taken, there be another humour in the Stomach answering to Oil of Tartar, whereby they may be precipitated, truly the Salt that is mixt with these dissolvent humours, when the *menstruum*, as is usually said, is gone, will be joined to the Pearl, and together with it will fall into the bottom of the Stomach, but there it will doe no less mischief, than formerly, because keeping its old acrimony, it onely changes its seat. But, which should especially be observed, the so highly extolled Magistries of Pearl, as without the Body they are not farther soluble even by the sharpest Liquor, so without doubt within the Body they can no more be dissolved by any humour, be it never so sharp. And then all these things signifie nothing

nothing to the humours that are in the veins far distant from the Stomach.

Menjottius.

XXIII. Diaphoreticks are much in vogue among the Germans, and *Paracelsus* highly commends this remedy in the Plague and Malignant fevers, and among other things an *Aqua vite* several times distilled, in such a way as that half the Phlegm may be left, which is thus tried, to wit, by putting a little of it in a Pewter Dish, and setting it on fire; if no fatness be left, let it be distilled no more; but if any be left, let it be distilled, till none remain, and give half a drachm of this in 4 ounces of warm Barley-water. To this purpose I have used *Elizir vite magni Duxis* and *essentia Theriacalis ejusdem* in the same quantity to 2 drops. Nor is there any reason why any one should reprehend the use of these Medicines, as being very hot, because the heat of them is easily dispersed, and penetrates to the principal parts, and carries off the infection of the humours by sweat, besides, we must use these hot things after taking of cold ones: for Malignant and Pestilential Fevers must sometimes be cured by virtue of the fire.

Fonseca, consult. 47. tom. 1.

¶ In a great decay of strength hot strengthening things need not much be feared, so as out of dread of encreasing the Fever, that we should be unwilling to deliver the Patient from imminent danger of Death, seeing we must always have greatest respect to what is most urgent: for when the strength of the Heart has been a little refreshed, what hot strengtheners have inflamed more than ordinary, may be afterwards qualified by violent Coolers, as *Sal Prunelle*, and Spirit of Vitriol mixt in Juleps and ordinary drink. This method observed by a prudent Physician, does happily succeed even in the giving of hot Alexipharmacks and Sudorificks. ¶ As to Bezoardick Medicines, which take away the poisonous quality of the humours, Treacle, Mithridate, *Confectio Hyacinthi*, without all controversy they are better than any other. Which, though in some Pestilential fevers they be disapproved, because they are hot, yet I have observed that more benefit than hurt is got from the use of them: Therefore *Galen*, in *Lib. de Theriac. ad Pisonem*, allows Treacle in Malignant and Pestilential fevers. Whose advice I approve, so the Fever be not of an exceeding Burning kind.

Riverius.

Zeechius, Consult.

XXIV. In Malignant fevers, before the breaking out of the Spots, you may sometimes observe the Hands of the sick far beyond the Wrist, or the Feet far beyond the Ankle, or both, to be discoloured with a colour strange and different from that of the whole Body, but momentary and fading: and sometimes they are very red: And such Patients do then complain of a great burning in their extreme parts, and ask for cold things, or some Crystal, although the rest of the Body be not so remarkably hot, which indeed is a mortal sign. But if the heat rage yet more in their Limbs, and gain strength, then the Hands of such feverish persons in two or three days space, without any other manifest cause, are consumed with such an Atrophy as usually appears in their hands that are wasted with the Consumption; you shall seldom observe that such recover, especially them whose Hands are black and blew, or of some dull colour. Of which thing I give this reason, following the example of the Excellent *Spigelius*, namely, That there are usually more, and more apparent Anastomoses of the Veins and Arteries about the extreme parts, as in parts remote from the fountain of Heat, and which therefore stand in need of more hot and spirituous blood: And hence it comes to pass, that the Blood which is evacuated out of the hand is much more fresh coloured and redder than what is evacuated out of the Arm, because the arterious blood is here also ever evacuated. By means of which Anastomoses that admirable Circulation of the blood is performed. But now if this Circulation be hindered in the extreme parts by the blood being boiled by the preternatural febrile heat, and made fibrous and tough like to dregs of Oil, how should it be but, as

standing waters corrupt, that so the whole substance of the Blood in humane Bodies should be corrupted? When even in fenny places, ponds, &c. we observe sometimes green, sometimes black, sometimes red water is either gathered or corrupted: but most frequently Marshes, and the woody parts of Houses lying under the Penthouse, or Eaves of the House, or the plastered Walls between grow green; because of the Rain abounding with the volatile Salt of grass and herbs, got out by the heat of the Sun; and the like reason may be given for other corrupt Waters. For they are variously tinged with the volatile Salt of the Earth (which must not be denied it) but then corrupted by the heat of the Sun in Marshy places, and they as it were counterfeit and falsely represent rust of Iron, Bole Armenick, Ochre. May not therefore likewise that most vicious and corrupt blood in the live Body of People, sick of Malignant fevers, appear livid, and having lost its rose colour, of necessity most filthily mar the beauty of the Skin in the outside of the hands and feet? When therefore the blood, or the mass of blood grows tough in the forehead manner, so that the Circulation of the Blood does, I will not say wholly cease, but is in part hindered, two Phenomena appear; either the parts mentioned are seized with an occult Gangrene, and therefore they are scarcely recovered, whose extreme parts are seized first with a manifest and pertinacious Heat, and by and by are very red, black and blew, all which things have their latitude and degrees; and when these things are over, the sick are not so violently burnt as before, or they do not perceive themselves so, but the heat falsely abates, and appears more gentle; the Pulse also is apparently better, but falsely, because the blood is tougher, and slower to motion, and Death is at the door: Or a strange colour, which is momentary, easily vanishing and fading, appears in the extreme parts of them that are sick of a Malignant fever. But I divine, that this portends that corruption of the blood is in making, or will shortly be, which is analogous, or like to the gangrenous labor, but that the Salt, rendered in some measure fixt in the Mass of blood, and especially in the said places most remote from the heart, may be made volatile again by Alexipharmacks; that is, prepared Hartshorn especially, and also shavings of crude Hartshorn, shavings of Greenland Unicorn, volatile Salt of Hartshorn, Salt of Vipers, Urine, Ash, Amber, and the like. Wherefore the famous *Rulandus*, who was ignorant indeed of the Circulation of the blood, yet nevertheless in the Hungarian Plague highly commends Chymical Salts, affirming that they do as much as any other Medicines towards the expulsion of its latent fomes, and saying, How much soever you endeavour to assuage the Symptoms, or to strengthen or refresh the Body, you labour but in vain, the fountain still remaining. Nature therefore being strengthened by the help of these Alexipharmacks and volatile Salts, discharges that partly fixed Salt in the mass of blood, being now made volatile, by the Arteries into the Veins, whereupon there appears not any one remarkable broad spot; but many and innumerable appear fresh, when the circulation of the blood is restored, plentiful sweat all the Body over intervening, concerning which Spots Practitioners doubt, whether they come symptomatically or critically. I indeed sometimes have observed, that by reason of the quantity and quality of the blood and corrupt Serum, which Nature was not able to correct, have appeared unhappily, and portended Death it self: I have also observed them to break out critically, as well as the Small Pox and Measles, which were kindly. But these forementioned Spots in Malignant fevers are the effects of a very bad Cause, as it argues so great a corruption of the blood in the live Body, that the Fermentation causes such a diacrisis or apocrisis in the mass of blood, as that the volatile Salt it self appears,

Simon Pau-
li, Digres. de
Feb. Malign.
Sect. 52, &
58.

appears, which is naturally apt to pass from subject to subject, and is by consequent a poison, which acts in its whole substance, and this is the *venenum miasmaticum*, or morbid excretion of Hippocrates.

XXV. Left any one should accuse us, as if we were ignorant of the *methodus medendi*, because when they that are sick of a Malignant fever with a hot and dry Intemperature, and that notorious enough, to the touch indeed gentle and kindly; we presently fly to Sudorifics, Diureticks, and finally to Salts (and I add, that I willingly allow him this, although it be not universally true, that all these things are hot) as to our last refuge, when the Fever requires cooling things. I will here introduce Hofmannus his reason, namely why Diseases of hot Intemperature are cured with hot Medicines, fetched from his *de Medicam. Officin. lib. 2. cap. 128*. Because it holds good not onely in the Venereal Disease, whose cure he treats of in the forecited place, but in Malignant fevers, and many other Diseases called Occult, and in such as wherein the *vis Sævor* of Hippocrates (which word many understand amiss) is said and believed to be. In that place after Fallopius he inveighs against them who granting Guaiacum to be bitter and biting, and therefore hot and dry, yet would have it most temperate, and as like our Body as any aliment, because they observe, that some grow corpulent upon the use of this Wood. By which contradiction some being constrained, saith Hofmannus, have held that this wood cures the Pox: indeed, whether it depend on hot humours or cold, by propriety of substance, or some occult property, and other Diseases joined with it, by manifest qualities. But indeed they are very much deceived: For if it be thus, when it cures the Pox it self, does it lay aside its manifest qualities? They will not say so, I hope; Therefore these Problems still remain undiscussed, Why Hot fights with Hot, and Dry with Dry? And if it be such in adjunct Diseases, why is it not in the root it self? But is it hot and moist perfectly, and does it nourish more than gelly Broth of a Chicken? Then this is sure, Guaiacum is hot and dry, and how does it drive away a Disease that is hot and dry? It is by dissolving and wasting the hot and dry humours (I add, that they appear such, or are really hot and dry, because of the Salt, wherewith the blood of Persons infected with the Pox, does without all controversie most exuberantly abound, for certainly this Plague of theirs is contagious) which is cooling by accident: So Rheubarb cools by purging such humours: but it does it not indifferently and without the Laws of Method, without which those who have tried it, have been greatly hurt. Yet does it nourish? For they take the Body of it? It nourishes not at all; for since aliment is a passive Word, that is, is a thing which is conquered, who can believe that so hot a Medicine can be conquered and turned into the substance of the thing nourished? Yet People grow fat upon it. You kill me; for I said but now it was done by accident, the hot humours being dissolved, and the obstructions of the Bowels being opened, which hindered the generation of Blood. But how bad a Logician are you, in that you distinguish not what is of it self, and what by accident? &c. But this is the summ of the matter, that the Venereal Disease, a hot and dry one, is cured with a hot and dry Medicine by accident; and that indeed by a simple Decoction of Guaiacum. Which we must affirm, is done likewise in a Malignant and Spotted fever, while we use Sudorifics, Diureticks, and Salts in particular, namely, that sharp and hot things are good for them by accident. Why? Because, while in it, no crisis, or but an imperfect one intervening, the Salt in the mass of blood being now made fixt, in the hands or feet, or rather in the Anastomoses of the Veins and Arteries of the said parts, far distant from the Heart, hinders the free circulation, these Salts render it volatile, which being either attenuated or made volatile, and discharged by the benefit of Circulation by sweat, or being more fixt, and as it were in fusion, by the Urinary passages, it does again freely doe its duty, which being procured, the blood is truly cleansed, and as it were ventilated, not onely

in the said Fever, but in other malignant and contagious Diseases, hereupon Health is procured, and the Malignity dispatched: But when in this acute Disease, and in a Malignant fever, Nature receives no assistance, then at length whatever, upon the ceasing of the Fever, or fermentation in the mass of blood, is corrupt and remains, breeds divers imposthumes and swellings in divers parts.

XXVI. And as there is extreme danger in purging in Malignant fevers, so it is well known that those Medicines which are commended against Fevers, and those commended against poisons are diametrically opposite one to another, and why? Because some Antifebrile Medicines have been found out, not by Indications, but by Empiricism: And since the manner of the corruption of our blood in Fevers, and especially in Malignant and Spotted ones, varies, and as it were eludes the industry of Physicians, hence it usually falls out, that both Agues, and especially Malignant and Spotted fevers, when we come to them we call Antifebrile and Specifick Medicines, are so hard to cure, that they are cured rather by chance than reason. And the Cause, besides that I brought from the corruption of the blood, is this, for that there is no Fever without fermentation or ebullition. Therefore if, for example's sake, Nutmeg, Alume, Powder of Tormentill, Antifebrilis Grollij prepared of long Oyster shells with Wine Vinegar, Pearl, Coral, Bezoar stone, Pretious Stones, and the like, be given to People in Fevers, it sometimes happens, that the Fever ceases, and Why? Because that Ebullition is stopt by them, just as we find that the heat of the Stomach is stopt by the alone use of simple Chalk powdered. But if you weigh these simples in the Balance of Reason, you will find it very likely that they act what they do act by drying, and by their earthy parts: for they are in an error, who think that these and the like things are given, onely to give a sweat, or to strengthen the heart; in which error many live, whom Platerus confutes, *Quest. Therapeut. 91*. Since therefore the ebullition caused by the febrile ferment is observed to be far more treacherous and occult in Malignant Fevers than in a Tertian, hence also the recounted simples are given with far greater success in an Ague, to fix its ferment, and stop the ebullition, than in Malignant fevers: for these proceed more occultly, yet more speedily, to their state: Hence therefore the febrile ferment is hurried more quickly in them than in a Tertian (which gives us some truce) from the Bowels into the Veins, or, if the contagion be communicated to us from any where else, from the capillary and cutaneous Veins and Arteries into the greater: And by consequent, because the beginning in Malignant fevers is quickly past over, you will doe little or no good by the recounted antifebrile Medicines, which have onely a drying faculty: for things of gross parts act so slowly, that they are not able to resist these Fevers. Besides, these and the like Medicines that are applied, are onely Cordials by accident; although Sennertus assign them a Cordial and Alexipharmack Virtue. But in my judgment these and the like things act or perform nothing else, but onely stop the ebullition of the Blood that is raised, if they are able: Which ceasing, the circulation of the blood performs its office aright in the Heart, and in this Case the Heart stands in need of no other Cordials, being sufficient of it self to breed Spirits: But if the case be otherwise, and if Malignity be joined with it, a cardiack Syncope usually supervenes. But we must speak of the other sort of Antifebrile Medicines, which are contrary to the former exceeding earthy and dry ones, and are more in use among the vulgar than Dogmatical Physicians, which are these, all the sorts of Pepper, Ginger, adust Wine, Worm-wood Wine, and the like, with which Agues are more successfully cured empirically.

pirically, than Continual fevers, and Why? Because accidentally by the use of these Medicines Vomir is caused, the sink or filth of the Stomach being stirred in the Fit, and so the febrile ferment is discharged together with it, or by reason of more robust Constitutions, the same ferment is carried by these hot and Diuretick Medicines to the Urinary passages, or is removed before it can infect the whole mass of blood; which on the contrary in Continual fevers, where no truce intervenes, is most easily corrupted. But if the febrile ferment be carried to the Urinary passages, and a troubled, ill coloured and stinking Urine be made, it portends usually an abatement of the Ague. Since therefore the case stands thus, who hence forward, where there is no room for Vomits, would not rather chuse certain Diureticks and Sudorificks in Malignant fevers, than run the hazard of a thousand uncertain things, termed Antifebriles, of a dubious or no event at all? Wherefore the never enough to be commended skill of the most famous *Rulandus* merits more and more confirmation, because that in these, and especially in Salts, he seems to place all the remedy he has against Malignant fevers: So *Lapis*, or *Sal Prunelle*, besides, that it stops the fermentation, is a great Diuretick: *Balsamus Sulphuris*, which also stops fermentation is a great Sudorifick: and both of them are most celebrated remedies against the Plague and Malignant fevers. Here also I have a mind to lay down in what manner Spots break out in our Skin, either by the motion of Nature alone, or of Nature helped by Alexipharmacks and Sudorificks, how our Skin comes to be beset with them, and again clear of them: Nature either provoked, or helped by Alexipharmacks, endeavours to expell the blood that is hurtfull to her, and more or less corrupted in its whole substance; which while she is in doing, it is very probable to me, that the very same thing happens to the mass of Blood, especially at the *Anastomoses* of the Veins and Arteries of the hands and feet, which befalls a frozen River, when the frost is broke: For as then the Ice is melted with the kindly and gentle heat of the Sun, so Nature being about to conquer the Disease by the benefit of the animal fire, or innate heat, cooling especially, after the state of the Disease, and burning no more so preternaturally as before, melts the blood thickned and made tough by the febrile heat in the Veins, and as it were congealing because of abundance of Salt, in the extremities of the hands and feet; and as a torrent or river carries fragments of Ice rapidly down the stream, so the blood in the Veins throws off small portions of the preternaturally fixed Salt, which are the Spots, or make them. Wherefore no wonder if Nature upon the use of Alexipharmacks or Sudorificks, made of the mineral, vegetable, and especially of the Animal kind, abounding more or less with volatile Salts, do sooner or later, gradually, or at once, according to the different temper of the Subjects, throw off Spots to the Skin, varying in colour, magnitude and number, which indeed *Rulandus* observed were fixt to the extremities of the Capillary Veins: But they are nothing else but the Salt of the Serum, and mass of blood, made volatile, which sweating through the Pores of the Skin is the proximate and onely Cause of all Spots in Malignant fevers, be they small and lenticular, or great and as broad as ones hand, while, to wit, it buds out in the Skin, and is then fixt in it, till upon amendment it gradually vanish by insensible transpiration, or, even while the Disease or Fever lasts, is resolved into Atomes so small that they cannot be seen, which we call the *μικροματα*, (or infectious particles) and are the proximate cause of the Contagion.

XXVII. When Epidemick Malignant fevers are abroad, or when they are not abroad, if the blood

that is let, when it is cold, be like to good blood in colour, and be as it were very rutilant, coming very near the colour of that Indian Throatwort, called the Cardinal flower, yea in a manner exceeding it; and having very little Serum in it, I have often observed it portend Death to several persons, when the by-standers and unskillfull were glad of this rose and scarlet colour, and congratulated the sick for it. But I have been long ago instructed, as ever distrusting such a suspicious goodness of the blood, to give my Patients in such cases Alteratives with Alexipharmacks, and especially this decoction of shavings of Hartshorn of my own description; Take of shaving of Hartshorn half an ounce, Root of Fenil, *Contrayerua*, *Scorzonera*, Carline-Thistle each 2 drachms, seeds of Columbine, Fenil, each 1 drachm, sliced *Jujubes* 2 ounces, boil them in a sufficient quantity of a decoction of Barley: Towards the end add of Conserve of red Roses 2 ounces, *Idem*. Borage, Buglofs, each 1 ounce.

XXVIII. *Antimonium diaphoreticum* is of marvellous efficacy, given from half a drachm to a whole one in Malignant fevers, Small Pox, Measles, yea and the Plague it self: But whence comes its diaphoretick virtue considering its attritive faculty? *Simon Pauli Quadrip. Botan. p. m. 225.* affirms it is used to stop the ebullition of the blood, not to raise a sweat; for as it is far better to spit on a spark, that it may not burn, and consume a whole House with the flame which it would rise to, so it is most advisable, by cold and dry things, (such as *Antimonium diaphoreticum* is, and also Root of Tormentil, Bistort, which are attritive and Diaphoretick, Bole Armenick, *Terra Sigillata*, burnt Hartshorn, *Calx Antimonii*; &c.) to stop the burning of the blood, or the fermentation following it, which if it exceed measure, so as the circulation of the blood being altogether disturbed, the blood be unspeakably corrupt, it can neither return again to its natural habit, and the contagion which follows that corruption, that takes so many off, is called the Plague, whose fomes, seminary, or contagion you will never cast out of the Body, except by Alexitericks or Sudorificks. But this reason does not yet satisfy, for if it held good, the cure would not be safe, while the cause of the burning or ebullition, would not by this means be taken away, and Opiates were better able to doe this work. Nay, Whence proceeds the usual eruption of Sweat after the use of the enumerated Medicines, which are cold and dry Diaphoreticks? Wherefore I judge that *Antimonium Diaphoreticum*, as also the other Medicines, are not indeed among the number of those Sudorificks, that have the faculty of attenuating and dissolving gross humours, but that they are such as, imitating Nature, do by their fixing and precipitating virtue, which depends on a peculiar texture of the parts, fix and precipitate the morbidick ferments, or the volatile Sulphureous Salts, and also strengthen the Tone, which being done, the tumultuating faculty of the *Archæus* is quieted, and throws off what is troublesome, by Sweat or Urine, from the *Lympha* p. 303. or mass of blood.

XXIX. We must take notice that *Oxyrrhodina* are not so convenient in Malignant as in Simple Putrid fevers, because the dispersing of poisonous vapours must be procured by all means, and not hindered, therefore gentle repellents must be made use of, or if the violence of the Symptoms be urgent, we may proceed to strong ones, so they be not kept long on.

XXX. In Malignant fevers we must have a care of Epithemes, for they may by no means be used in poisonous Diseases, and therefore we must avoid them as a pernicious Poison. ¶ In Malignant fevers we must utterly avoid cold Epithemes, which are proper for the Heart; but they must rather be applied warm: for otherwise there is fear, lest, when the Malignity is translated and struck back from

Idem.

Frid. Hofmannus, Clavis Schrederiana, p. 303.

Riverius.

Mercatus.

from the Circumference to the Center, more harm than good result from it: Therefore cordial Baggs are besprinkled with no liquours, but what are spirituous, for fear of repulsion.

Wedelius.

XXXI. If the extreme parts happen to be cold, there is great suspicion of Malignity and Languidness of faculty; for that Coldness testifies there are both these Causes, to wit, a Malignant Putrescence of the Humours in the Bowels, or Ulcers, or great Inflammations, or violent pains in the Intestines; all these things force the heat to run inwards, and to desert the out parts. In this case there should be the greatest care imaginable to recall the heat, and by all means to keep these parts in an equal temper with the other parts: For although this coldness of the Feet be no cause of the Disease, but a Symptom, yet it is removed by revocation of the Heat, that is, of the Blood and Spirits. And nothing is more beneficial than to call them back, because of the harm of their running to the internals, which increases the inflammation and other affections of the Inwards, and the heat it self by its being pent in is the cause of its own extinction. Therefore we may not apply cold things to the Feet, lest the burning heat be repelled inwards (for in colliquating Fevers applications are best made to the Body between the Armholes and the Groin) it is well if you can keep them from being cold.

Vallesius.

XXXII. When in Continual, yea in Malignant fevers, where a Delirium is imminent, or the Patient cannot sleep, we apply Plasters to the Soles of the Feet, which are held to be applied for revulsion sake, truly here is a notorious fallacy of the Cause committed. For they are all hot things, which abound with their volatile Salts, and are of very thin parts, Pigeons cut open alive, pickled Herrings split, Horseradish, Leven with Salt, Mustard, &c. Hence, while in the said extreme parts of the Body both the venous and arterious Blood, being burnt up with the febrile heat, is made heavy and dull, cannot freely circulate, these very things applied to the Soles of the Feet do attenuate, melt and put in fusion that fixt Blood and Serum, by means of those subtle and volatile Salts wherewith they abound, and so by accident, while the free circulation of the blood is procured in the Feet, and it cannot reflaginate into the Head, natural sleep creeps on.

Simon Pauli.

XXXIII. The use of Wine in this Fever sometimes is very beneficial, for it is a great cordial, and very opposite to Malignity: Yet it often does harm by increasing the feverish heat: Wherefore the constitution of the Patient, and Nature of the Disease, must be well considered. If the Fever be small, the poisonous quality intense, and the Patient Phlegmatick, mixt with water, it may be given safely and successfully: In a violent Fever, and a chole- rick Body Wine is destrutive. I have by infinite experiences observed these things, especially in the purple Fever, which was at Mompelien, anno 1623. distinguishable from the true Plague onely by the Bubo. For to those Patients, whose Pulse was not very frequent, but like the Pulse of a healthy man, their Tongue moist, and no thirst, I gave Wine with good success, and the relief thence emerging indicated the continuation of it, both because the Fever was not heightened by the use of it, and there was no thirst nor driness of Tongue raised: In what Patients the contraries were, I forbade them Wine altogether. Yet we must observe, never to give Wine in the first days, lest the crude matter be too much moved, but onely about the State, when the signs of Malignity begin more fully to exert themselves.

Riverius.

XXXIV. In the year 1623. after the Siege of Mompelien, a very Malignant fever raged for several months, of which half that were sick died: and they peculiarly who had the Parotides (or swellings of the Ker-

nels behind the Ears, which came usually about the ninth or tenth day of the sickness) did all die: And when I had seen several such, but could save none of them by any Alexipharmacks, I began to think that the Parotides must needs be mortal, because that part was not able to receive the whole moribund matter, which remaining within, destroys, and that Nature's work must needs be assisted. And although the Patients had a small frequent, and almost formicating pulse, so that they seemed to be in the very agony of Death, which usually shortly followed: Yet revolving in my mind Celsus his opinion, That many things are very well done in an extreme danger, which should otherwise be omitted, And that it is better to try a doubtful Remedy in one or two, than to leave so many sick to perish, I prescribed Bleeding at several times, because of weakness, twice or thrice on the same day, and a Purge the day following. By which means all who had those Remedies administered them, did happily escape, and not one died after that. ¶ I will not think much to tell what I am wont to doe, when Patients in Malignant fevers have the Parotides arise, because I think many were so saved, who had otherwise perished. As soon as they begin to rise, I anoint the part with some suppling Oil, as that of Chamæmil, and if they are slow in coming out, I set a Cupping-glass to the very place, lest the abscess be too little, to doe any good: But when it is apparent enough, if it increaseth very much in a short time, I let blood again, lest it grow greater than can be indured: And then by and by I open the tumour, while it is yet hard, never tarrying for suppuration, with a red hot knife; on one side, if the Swelling be but on one side; on both sides, if the Swelling be on both, and I apply a suppurating Cataplasma. For the most part the business succeeds well, for the Swelling quickly putrefies when the Eschar is made, and then Matter begins to run; and the head and other parts are purged by that Orifice. Nor let this seem cruel to any man; for the glandulous part is but a base one, and therefore we may cut and burn it, and fear to doe neither.

Riverius.

Vallesius.

XXXV. One was violently ill of a Purple fever, in the year 1622. and was troubled with a vomiting of all potent matter, as soon as it was drunk, retaining onely Broth: The Fever had ragged with cruel burning and thirst for four days, which could be quenched by no drink: The inwards were so parched and burnt, that the Tongue was very black and dry. This so grievous a symptom was removed by this slight Medicine: Take of Salt of Wormwood i scruple, fresh Juice of a Lemon i spoonfull; they were mixt in a spoon, and given presently. The vomiting was stopt immediately, and from that time he drank as much as he would, and never thenceforth cast it up again.

Riverius.

XXXVI. Since the Hands and Feet, according to the motion of Nature or Circulation, abound more with the excrement of the third Concoction, than any other parts of the Limbs, who then is there that would not then think it credible, that in Fevers, and especially in malignant ones, the humours are most corrupted about these parts? And that it is not convenient for Physicians or bystanders, to handle the hands of Persons in Malignant fevers oftner than needs they must, unless they are willing to be infected with the Contagion? Take this experiment of the matter from me; after I had several times felt the Pulse of People in Malignant fevers, my hands began to itch, as if they had been stung with Nettles, which, when I came home, I washed, and lo, all on a sudden, my fingers were strangely and incredibly swelled, the swelling being quite gone within a quarter of an hour. ¶ I here experienced

Simon Pauli.

the same, Anno 1669. when the small Pox were Epidemical: As my Wife (yet free from them) was sitting with a Noble Matron, she took me aside privately into another room to tell me something concerning the state of the Patient, but while she was talking to me, I felt as it were Needles darted from her mouth into my face, and I ordered her to cleanse and wash her face, and to arm herself with Cordials, for prevention sake, so by God's assistance she enjoyed the company of her intimate infected friend without any harm.

*Febris Peripneumonica, or, A Fever
with an Inflammation of the Lungs.*

Its Description and Cure.

TOWARDS the latter end of Winter, and beginning of Spring, there arises every Year a Fever, with a great many Peripneumonick Symptoms. It seizes full Bodied and gross men above all others, or those that are arrived at, or (which happens oftner) are past man-age, and such as are more than ordinary addicted to strong Liquours, especially Brandy. For when the Blood in such men is loaden with pituitous humours, gathered in Winter time, and the same is upon the approach of Spring put into new motion, a Cough upon that occasion does now and then enter, by means whereof the said humours fall violently upon the Lungs: at which time if perchance the sick party, living in no order, drink still freely of such Spirituous Liquours, the matter now growing thick, which caused the Cough, both the passages of the Lungs are stoppt, and the Fever seizes the whole mass of Blood. At the first approach of the Fever the Patient is sometimes hot, and sometimes cold: He is vertiginous, he complains of a racking pain in his Head as often as the Cough troubles him. He vomits all he drinks, sometimes without a Cough, and sometimes with it. He makes a troubled Urine, and very red. His Blood, when let, resembles the Blood of Pleuritic Persons. He is often out of breath, and draws it thick and short. If he be bid to cough, his Head akes, as if it were ready to split, (as the Patients usually express it) and he has a great pain in his Breast, or the straitness of his Lungs may be heard by them that are by whenever he coughs, the Lungs not sufficiently dilating themselves, and so the vital passages being stoppt, as it seems by their swelling; whereby the circulation being intercepted, there are, in full bodied People especially, no signs of a Fever; though this also may happen, by reason of the plenty of pituitous matter, wherewith their Blood being oppressed cannot arise to a full ebullition.

In the cure of this Fever I think this is my business, to make revulsion of that Blood by Phlebotomy, which is the cause of the stoppage and heat of the Lungs; to take off the obstruction, and give air to the Lungs by pectoral Remedies; and to restrain the heat of the whole body by means of a cooling Diet. But since on the one hand the load of pituitous matter contained in the veins, which continually affords fuel to the Inflammation of the Lungs, seems to indicate repeated Blood-letting; and since on the other

hand the diligentest observation that I could make, hath informed me, that Phlebotomy often repeated in Fevers proves very bad for them that are of a gross habit of Body, and this affrighted me as much from the repetition of it; I used frequent purging instead of bloodletting, which is well enough substituted; in them that have an abhorrence of large and repeated bleeding. Therefore I proceeded thus, I ordered him to be bled in the Arm as he lay in Bed, and I would not suffer him to rise for two or three hours; seeing all taking away of blood, which in some measure spoils and destroys the whole compages of the Body, may by this means more easily be endured; so that a Patient can bear it better, if ten ounces be taken from him in Bed, than if he lost but six or seven, after he is risen. The next day in the morning I give him the following Potion; Take of *Cassia* extracted 1 ounce, *Liquorish* 2 drachms, fat figs No. 3. Leaves of *Senna* 2 drachms and an half, trochiscated *Agarick* 1 drachm. Boil them in a sufficient quantity of water. In 4 ounces of the Colature dissolve of *Manna* 1 ounce, Syrup of *Roses* solutive half an ounce. The day after I use to let Blood a second time, and one day intermitted, I order the Cathartick Potion, now prescribed, to be given again, and so to be repeated by turns, till the Patient perfectly recover. Those days he does not purge, I advise him to use the pectoral Decoction, Oil of sweet Almonds, and such things. In the mean time I keep my Patient from Fleth, and Broth thereof, and especially from all Spirituous Liquours whatever; instead whereof I allow him *Pisane* of Barley and *Liquorish* (and small Beer also, if he desire it,) for his ordinary drink.

And this indeed was the way to conquer this bastard *Pleurisie*, which arose from a pituitous matter gathered in the Blood through Analogy with Winter, and discharged into the Lungs; wherein not onely repeated Bleeding but Purging also was indicated; otherwise than in a true *Peripneumony*, which I judge is clearly of the same nature with the *Pleurisie*, and differs from it onely in this, that a *Peripneumony* affects the Lungs more generally. Moreover we cure both Diseases by a Method perfectly alike, that is, by Bleeding above all other things, and by cooling Medicines.

This bastard *Peripneumony*, though it be a little like a dry *Asthma*, both as to difficulty of breathing, and other Symptoms also, yet it may well enough be known from an *Asthma*, because in the *Peripneumony* manifest signs of a Fever and Inflammation shew themselves, which never appear in an *Asthma*; although they be less by much, and more obscure in this sort than in a true *Peripneumony*. Sydenham.

Febris Pestilens, Pestis; or, A Pestilential Fever, the Plague.

The Contents.

- Wherein the Essence of the Plague consists? I, II.
 Whether the Plague ought to be methodically cured by Bleeding, Purging, &c? III.
 Whether Bleeding be proper in the cure? IV.
 Whether Bleeding be good for preservation from the Plague? V.
 What Vein must be opened in the cure? VI.
 It must be cautiously used in hot Countries, and omitted in cold ones. VII.
 When there is a Bubo, a Vein must not be opened. VIII.
 Whether we may Purge? IX, X.
 We may purge in a Bubo. XI.
 Purges in the Plague must be gentle. XII.
 When they that are sick of the Plague must be Purged? XIII.
 Whether a Vomit be proper? XIV.
 The benefit and condition of Evacuators. XV.
 In private Pestilential fevers violent hot expulsive Medicines are hurtfull. XVI.
 For whom hot Chymical Medicines are hurtfull? XVII.
 The Western Bezoar-Stone should be preferred before the Eastern. XVIII.
 Whether Bole Armenick be good in the Plague? XIX.
 When Treacle may be given? XX.
 Whether the use of Spirit of Vitriol be safe? XXI.
 A true and proper Antidote is not yet found. XXII.
 We must not trust to one Alexipharmack. XXIII.
 Hidroticks must be added to cooling Juleps. XXIV.
 The way of wiping off the Sweat, and the Regiment, when a Hidrotick is given. XXV.
 Hidroticks must be given frequently. XXVI.
 Cordials (which ought to be Acid) must be varied. XXVII.
 The efficacy of Acids in its prevention and cure. XXVIII.
 Whether Garlick may be admitted for prevention. XXIX.
 Camphire must be used with caution. XXX.
 Spices are pernicious in the preservation. XXXI.
 The efficacy of Narcoticks, and the way of giving them. XXXII.
 A preservatory method for a Physician, that visits people infected with the Plague. XXXIII.
 Although the Symptoms abate, the Patient is not out of danger. XXXIV.
 The benefit of Cauteries in preservation. XXXV.
 At what time they must be put in use? XXXVI.
 The excellent use of Salt and Salt things in the preservation and cure. XXXVII.
 Salt fish is good. XXXVIII.
 The Diet. XXXIX, XL.
 Whether Wine may be given in a Pestilential fever. XLI.
 A Suppository is to be preferred before a Clyster, if the body be costive. XLII.
 The restitution of the lost appetite, with what and when it must be procured? XLIII.
 We must provide for our safety by flying cautiously. XLIV.
 The habit of a Physician in the Plague-time. XLV.
 What such the lodging of the infected person should be. XLVI.
 Sydenham's way of curing the Plague. XLVII.
 Whether Narcoticks be good for watching and Head-ach. XLVIII.
 In a Looseness we must abstain from Acids. XLIX.
 Sylvius his method of curing the Plague. L.
 The cure of the Plague is performed with very few remedies. LI.
 Vomits may be mixt with Hidroticks, and these with Acids. LII.
 A pestilential fever requires a cure contrary to other Fevers. LIII.
 They that have Swellings arise, without any other Symptom, no Physick is requisite for them. LIV.

I. AS for what concerns the Essence of the Disease, I do not undertake exactly to define it: But because the rise of all similar Diseases is usually derived from some fault of either the first or second qualities (which is as far as we can go in this obscurity of things) I almost think that the Plague is a peculiar kind of Fever, which has its original from the Inflammation of the more spirituous particles of the Blood, because, in their tenuity, they seem most proportionate and adequate to its most subtle nature. Which, if it be in the highest subtilty whereof it is capable (as in the beginning and state of the Epidemick constitution) it suddenly, and before one is aware, dissipates the innate heat, and destroys the Patient. The dead Bodies in the mean time, of those that die so suddenly of the violence of this disease, are all over beset with purple spots, because the fibres of the Blood are broken by the violence of the intestine conflict, and its frame wholly dissolved. And this Tragedy is acted by the extreme subtilty of this flame, even without any febrile ebullition of the blood, or any precedent sense of other sickness. Otherwise, than for the most part it happens, where the morbidick cause is not so subtle, and does as it were strike at life with a blunter weapon. But such sudden death seldom occurs; For, as in other Fevers, cold and shivering for the most part invades Men, and heat follows, and continues till the particles of the inflamed blood be discharged to the Emundories, and be there turned into Pus, like common Inflammations. Now, if the Inflammation be yet more remiss, it usually produces Fevers, which they call Pestilential, as it often happens in the end of a Pestilential constitution, till that sort of Fevers wholly disappear. But not onely the presence of a Fever, but the colour of the blood that is let, which is like pleuritick and rheumatick persons, does favour this opinion; and the adust appearance of Carbuncles, not unlike the impression of an actual Pyrotick, as also the Bubbles themselves, which as constantly follow the Inflammation, as any sort of Tumours use to follow it, and as most Inflammations terminate in an Abscess. Moreover, the season of the year, in which an epidemick Plague for the most part arises, seems to contribute its share toward this thing, for at the same time Pleurifies, Quinsseys, and other affections of an inflamed blood are usually abroad.

But here some may inquire, If the Plague consist in a certain Inflammation, How comes it to pass, that Medicines of a hotter rank, such as almost all Alexipharmacks are, are used with so great success, both in the cure and prevention of it? To this I answer, that they onely give relief by accident, namely, by benefit of the Sweat, which they raise, whereby the inflamed particles of the Blood are dispersed and cast out. But if it happen, that when they are given, they be not able to move Sweat (as it often happens) presently the burning of the blood, more enraged by the additional heat, openly proclaims their mischief. I know also, that hot Antidotes are every where cried up for Preservatives, but with what advantage, remains yet to be proved. Yea Wine drank liberally, and other stronger preservatives taken at set hours every day, have cast several into this disease, who otherwise, in all likelihood, had remained safe and untouched.

II. All the Symptoms observable in the Plague do either confirm or prove, that a lixivial Salt, and that a sharp and volatile one does offend. Now this must be shewn from Medicines, that are used with good success, both for its prevention and cure. And whoever would gather any thing for certain from the Medicines that are used, it is necessary for him onely to consider Simples, or those that are least compounded. About nine years ago, when I every day visited many that were sick of the Plague, I took nothing but a spoonfull of Vinegar, soaked up in the crumb of bread, for prevention sake, and in the morning

Sydenham.

morning before I visited my Patients. I used this sort of remedy for eight whole months, and I never after perceived any harm from the Infection for the whole time. But when this malady was by degrees removed, and I had left off taking of Vinegar any longer, I found afterwards a little Head-ach come upon me, whenever I entered an infected house, although I knew it not, and feared nothing. I know indeed that very few can use Vinegar for some weeks, as I did, while some, by reason of their peculiar melancholick constitution cannot persist in the use of it for many days. Others use to commend a draught of Rhenish wine, or of old stale Beer in the morning. I know there are not wanting some who commend simple Spirit of Wine, or Treacle-water, but I know it has done many harm, which cannot be said of Acids, at least in reference to the Plague: *Elizir proprietatis*, Spirit of Salt, Sulphur, or Vitriol, taken in a little Beer, or Wine, is commended. Acid fruits are also commended, as Citrons, Oranges, Pomegranates, Corinths, &c. the smell also of Vinegar in a Sponge is refreshing, whether it be simple Vinegar, or impregnated with some Spice, or Aromatick Plant. So that if a Man compare the most effectual things for prevention of the Plague, he will find, that either all of them are Acids, or made up with Acids. Whence I think it is evident, that an Acid is not onely desired against the Poison of the Plague, but that the Poison is especially hit and resisted by it. But for them, to whom mere Acids are troublesome and grievous, they may be mixt with Spirit of Wine. So by means thereof Spirit of Salt is so allayed, that almost all its acidity is taken off, if one of them be often cohobated with the other, and yet it ceases not to doe good in the Plague. It is requisite therefore, that in this case Medicines should be so accommodated to every ones peculiar temperament and constitution, that no harm, but a great deal of good may accrew to them: To this purpose Medicines may be made up in divers ways and forms: To this purpose also hot crude Tartar, and the cream of it, as also *Sal Tartari vitriolatum* may be used any way, in Broth, Wine, Beer, a Julep, &c. In one word, Acids do conduce, above all other things, to the prevention of the Plague, taken in a way most accommodate to everyones particular nature. Since experience teaches, that, these things are very true, my Opinion is by this very thing confirmed, That our Acid is resisted by the Pestilential Poison, to which, since nothing is observed more contrary than lixivial salt, the Poison may deservedly be reckoned to consist in a lixivial Salt: But because it is a swift and very efficacious Poison, therefore I judge, the same consists in a volatile and sharp Salt.

III. Whether the method of curing a Pestilential putrid Fever require both Evacuations before or after the use of an Alexipharmack, and whether Evacuations should be first? Since these two questions have that coherence, that one of them cannot well be parted from the other, let them be decided together. It is evident, that not onely a Plethory, and a Cacochymie, but rather the very greatness of the Disease does indicate and require both Bleeding and Purging: But every Disease is said to be great or small on a threefold account, either because of the excellence of the part afflicted, or of the violence of the Disease, which the violence of the Symptoms doth shew, or of its malignity or virulence. But since a Pestilential fever first annoys the heart, it partaking of a Poisonous Contagion, and rages with horrible Symptoms, a *delirium*, *Bubo* and Carbuncle, it ought not onely to be called great, but the greatest of great Diseases, and seems to require both Evacuations. But this precept of sacred *Hippocrates* and *Galen* holds not perpetually in the cure of all great Sickneses: For if one be intoxicated with a poisonous Animal, or outwardly

with a poisoned weapon, then *Galen* and *Democritus* judge there is a two-fold indication, either by evacuating the poison, or by altering; But they determine, that the evacuation must not be by Purging or Bleeding, but by help of such Medicines as by their heating faculty may draw and get out the poison, as Cupping-glasses, Cauterics, &c. And the other indication for the Method of curing Poisons, consists in Alteration, by Medicines, which either in quality, or in their whole substance, are opposite to the poison. It is my advice, that we especially observe these two ways of curing virulent Diseases and poisons, while we cure Pestilential fevers: Because, seeing all Poison, of its own genuine property, does first of all affect the heart, the House and Fountain of life, and then is on a sudden dispersed through all the Bowels and habit of the Body; What is more necessary than that you should first of all give assistance and relief to the heart by those Alexipharmacks, which either in their quality or whole substance, resist the destructive poison of the Plague? But if a *Bubo* break out in the Groin, an *Impothume* in the Arm-pits, or a *Parotis* behind the Ears, about the Emundories of the Brain, Heart or Liver, or in the mean time a Carbuncle bud out in the Arms or Legs, then as in poisonous wounds, you must hastily apply Medicines to the place affected, which may draw out the venome, and scarifie the Abscess before maturation, or open or burn it with an actual or potential Caustic, if the Patient fear fire, which by their heating and burning virtue, not onely attract noxious humours, but also often open gatherings made by them. But whether beside these things the noxious humours of this Disease be to be evacuated by Bleeding or Purging, is not yet determined. But seeing the cause of the Disease is mixt with the Blood in the Veins, What hinders, but that after ten or twelve hours, from the taking of the Alexipharmack, and when the Sweat is ended, and the Spirits refreshed, we may breathe a Vein in the same side, in some proper place, under the abscess, or Carbuncle, age and strength concurring, seeing Phlebotomy not onely draws out the infected humours, but also opens obstructions, and abates the heat of the Fever? Nor need you fear the revulsion of the humours inwards, when the Abscesses are covered with strong attractive Medicines, which resist revulsion. Wherefore *Galen* and *Paul* advise, to begin the cure of a Carbuncle with Bleeding till one swoon, yet exclusively, which I do not disapprove. But whether strong Purges in the cure of this Fever be so convenient, I cannot easily say; because they do but the more disturb the noxious humours, and disperse them through the whole Body, and draw them again inwards, and waste the strength; and they participate also of a poisonous quality, and use very often to cause a Bloody flux and Loosness, which is usually otherwise peculiar to this Fever, and for the most part is a mortal symptome, where-with all that were taken in the long Plague of Rome, who could not be helped by Bole Armenick, died, as *Galen* 3. *Epidem* relates; But if the obstructed Belly do not void it Excrements, who will dissuade the use of a lenient Clyster? And if the Disease have passed the state, that the reliques of the Disease may be extirpated, a Purgative Medicine of Rheubarb, Agarick, *Cassia*, Tamarinds, *Manna*, can doe no harm; as those strong ones, *Diagridium*, *Coloquintida*, &c. seeing they savour of Poison, can do no good. I have cured several, who were given over for dead, in this Plague, by this method. If before the beginning of the Disease one went little or not at all to stool, then I procured one by a Suppository, or a gentle Clyster; afterwards I gave a Sudorifick Alexipharmack, which, according to the age and strength might provoke Sweat for two or three hours or more: I applied Epithems to the Heart; And if an Abscess or Carbuncle arose, I presently applied Pla-
sters

fers, to draw out the Poison; Then about six or seven hours after Sweating, but the strength first refreshed by some Broth, I opened some convenient Vein: But every day after the taking of the Alexipharmack, both morning and evening I gave some alterative Potage, which might, both in quality and whole substance, resist the poison of the Disease, and also strengthen the Heart, such as are made with juice of Lemons, Citrons, Oranges, Sorel and Wood-Sorel, with a little Vinegar and Sugar. And in the declension of the disease, if the appetite were languid, I first Purged the Blood from the reliques of the Contagion by Medicine, that the Body might safely be nourished; Last of all I ordered the Chirurgions not to hasten the healing of the Sore or Carbuncle, and I charged the Cooks to give the Patient his proper Meat and Drink at the time prescribed. By which way of cure a vast number of sick people recovered. ¶ Hence it is evident, they are under a mistake, who being content with Alexitericks onely, do give them to every Age, without method, relying onely on Experience; And that all method should not be rejected, seeing a Pestilential fever has not onely one Indication of Cure, but two or three: For the Fever requires cooling; the Putrefaction requires alteration, evacuation, &c.

IV. Men are of quite different opinions, whether Bleeding be convenient, in the cure of Pestilential fevers, some approving, others disapproving the opening of a Vein in the Plague. But neither opinion taken simply is reckoned safe by *Peter Salius*: for he finds in either what he may deservedly disapprove. They that judge we must proceed onely by Alexipharmacks in the cure of a Pestilential fever, wholly rejecting Blood-letting; they, he says, have regard onely to the pernicious quality; but they slight the putrefaction (or fermentation rather) of which nevertheless, in such cases, most reckoning should be made, for except you remove it, the Fever, which is putrid, cannot be removed; and you will scarce be able to cure this, unless you abate the quantity, that causes and upholds obstructions, and which is grievous to Nature. Wherefore we must indeed give Antidotes, to infringe the base infection; yet we must likewise doe our endeavour to take away the Putrefaction, whose cause we shall then try to remove, when we shall attempt eventilation by exonerating Nature, and diminishing the matter. But their opinion, says he, who have admitted and commended Bleeding in a Pestilential fever, I am afraid has been broached to the destruction of Mankind: For he reckons this to be an Axiome of eternal verity, *That a Vein should never be breathed upon the account of a Pestilential Affection; Or, Blood-letting must by no means be admitted in a Pestilential fever.* But seeing, sometimes Nature must be eased of her Burthen, and the body must have vent, he shews another way besides cutting a Vein, whereby we may satisfy this Indication without loss of strength, that is, by application of Leeches to the Hemorrhoid Veins, or by scarifying of the lower parts. I indeed think, that opening a Vein in a genuine and simple Plague, is for the most part hurtfull; because, by frequent experience, it is oftner found to doe hurt than good in Pestilential fevers; and I judge that those remedies that are instead of Venesection, may more properly be used in the simple Plague; But I do not wholly disallow Venesection on it self in the Plague joined with a Fever, or in Pestilential fevers themselves. For when the body is plethorick, and the strength is oppressed, or the loss thereof is imminent from the plenty of blood, or when a Fever is joined with the Plague, or a Pestilential fever it self afflicts a Man, sometimes a Vein must be opened, especially in those that are used to it, when nothing in its stead seems to suffice, but it must be in the beginning, by and by after Alexipharmacks are given, and when their

operation is onely over. And here I fully approve of *J. Palmarius* his advice, cap. 23. Where he thus determines about bleeding, In a Plague which is complicated with a putrid constitution, where there are the Head-ach, want of Sleep, Tossing, Thirst, a dry Tongue, an ill Pulse, great Heat about the Heart, and other Symptoms proceeding from the heat and putrefaction of the humours. If the Veins be turgid with plenty of humours, blood ought to be let, more or less, as the fullness of the Vessels, Age, the Season of the year, the habit of the Body, and the violence of the Symptoms will bear; So the strength be good, and the Physician be called in the beginning of the Disease, and it be taken away in much lesser quantity than in other Fevers. And according to the same *Palmarius*, the blood must be taken from the Foot or Leg, if a Bubo be protuberant in the groin, or in any part below the Loins; But in the Arm, if in the Jaws, or Arm-pits, or in any other part above the Kidneys, or even in the Loins themselves, and that always on the same side. As it is well advised by the same party, that we must abstain from blood-letting, whenever a Pestilential fever affrights us with lowness of strength or fainting: Besides, whatever simple and legitimate Plagues do shew no signs of putrefaction in the Urine, or in other excrements (as those which have no Fever joined with them) these, *Palmarius* being judge, abhor blood-letting, how cruel soever the Symptoms be. In the Plague therefore, as the Plague, bleeding does no good: But as there is imminent danger from the quantity of blood, while strength is good, and other circumstances do not hinder, it must be diminished.

V. Whether in the time of a Pestilential fever, bleeding be proper for preservation? Almost all Writers shew, that a Plethory *quoad vires* (because this is it, from whence there is imminent danger of corruption) must be taken away by bleeding. But this opinion is not convenient always, and in every place. But it may be of use with this distinction. In a wholesome Air, in Spring and Autumn it may be admitted; but not in the midst of Summer or Winter, nor in very hot or cold Countreys, or Constitutions: On this hand the body is too much cooled, on the other hand too much spent, and it is not then safe to evacuate sound bodies. If the state of the Air be pestilential, blood-letting must never be practised, because of this plenitude; for it very much exhausts the Spirits, and stirs the humours; and the inspired Air more easily impresses its pestilential action; and the Disease, if it come, is conquered with more difficulty, because the strength is spent by blood-letting. For as when Men have drunk poison after bleeding, it more easily penetrates, and is more difficultly overcome; In like manner, they that are well, who admit of bleeding in a pestilential Air, more easily receive the bad quality of the Air, are worse, and escape with more difficulty. Besides, such a Plethory may easily be exhausted by a more spare and thin diet, by loosening things, and cleansers of the blood. But they that have taught, that when blood abounds, a Vein must be breathed, were either mistaken, if they spake of this plenitude, or they were superfluous, if their discourse was of plenty of good blood: Both because a pestilential fever does not impend from this, and because it is good to abound in blood, because Life depends especially on it. Which if it so redound, as to distend the Vessels, although bleeding be proper, yet it is not our case, because hereon, not a pestilential fever, but bursting of the Vessels, extinction of the native heat, &c. does usually follow. And although a Plethory *quoad vires* in a pestilential Air, be not to be taken away by bleeding, yet considering the causes hereof, we sometimes admit some diminutions of it, as if it be superfluous on account of the Diet, or of some evacuation oppressed. For this reason in Wo-

men I commend bleeding in the lower Veins, which because it spends the strength less than in the upper Veins, it may, without any impending danger, both relieve nature, and provoke the *Menses*. I say the same of them that have the hæmorrhoids stop'd, or any accustomed hæmorrhage suppress'd. To which evacuations nevertheless, I should never descend, without a new and urgent indication. ¶ Although letting of blood do not draw out the Infection, yet, I confess, in curing and preventing a putrid pestilential fever, it does a great deal of good, if it be seasonably us'd; but in a contagious one, which is caused by inspiration of the seminary, seeing all hopes of safety consists in preserving the strength, we must consider again and again, lest any thing be done rashly, and without reason.

VI. *Oribasius* advises, not to bleed in the cure, but to scarify the Legs; which, according to *Alpinus*, is customary with the *Egyptians*, where the Plague is commonly endemical. This may well be done, when we would make a general evacuation, for the blood will run out plentifully (amongst them, the fleshy part of the three Muscles of the calf of the Leg is cut with a Razour, in a straight line; 4 or 5 pretty deep wounds are inflicted, and they have a care that they do not close for a long time, so the filthy corruption is discharged.) And that place is so far from the heart, that it is not so sensible of this injury. This also may very well be done, if a Carbuncle fix near the region of the heart, and if you think blood ought to be let, but if it seize other parts remote from the heart, the next place to the Swelling must be bled. If Carbuncles or Bubbles appear in the Groin, the lower Veins are opened. If one appear in the Neck, a Vein in the Forehead must be cut, or the Veins in the Nose must be opened: Or the Jugulars must be opened, or one under the Tongue, and Cupping-glasses must be set to the Arms, and the Neck deeply scarified. From the foresaid reasons (yet trust experience) I durst almost infer this Maxim, A Malignant Tumour arising of it self, if it precede a pestilential fever, does, in its beginning, and while the strength is good, admit of large blood-letting in the Vein next it, that the poisonous matter may be exhausted, and the fear of a future Fever prevented. But yet, if the Stool or Urine have no sign of putrefaction, a Vein must not be breathed, though the Symptoms be urgent. But if this Impothume follow the pestilential fever, Phlebotomy will do hurt. Therefore, before there is a pestilential fever, we may bleed. Yet seeing the Plague comes from contagion, because of the poisonous putrefaction already conceived, I should think we should abstain from blood-letting.

VII. Bleeding is very prejudicial to them that are sick of the Plague; and it is very dangerous also for them that would be preserv'd from it. The poison often lurks, for some days, weeks, or months, in the body, out of the Vessels, before it shew it self by the use of Medicines that stir the blood. But if by Venæsection you draw it to the heart, it behoves you to inquire, whether or no the diminution of the blood, spirits and strength, through your means, be not the cause why the Heart is suffocated, and is not able to chase away its enemy. Physicians indeed, who deserve credit, and are well versed in their art, do say, that cautious bleeding, and celebrated at the beginning, has ever been the chief of Antipestilential means. But they that in these cold Countries imitated them, soon left it off; yea, our Country Physicians are now wholly silent as to bleeding.

VIII. The Circulation of the blood tells us, that all poisonous and bad humours, which are either thrown off by Nature it self, or come from abroad, should immediately, at the very first moment, be drawn out from the Glandules, and the Skin it self, by means of attractive Medicines, lest that in the

space of a small time all the blood be infected, and the heart it self be oppress'd, and suffer violence. This may sufficiently shew, how dangerous it is to breathe a Vein, and Purge the body in a Pestilential and Venereal Bubo, yea, and in all venomous wounds; on the contrary, how necessary it is to draw out the peccant matter by the help of sudorifick and attractive Medicines; And therefore that the doctrine of the Circulation of the blood is of great use in the Art of Physick.

IX. Purging in a Pestilential fever is suspected, both because of the lowness of strength, and because a Loosness, and that a colliquating one, quickly happens. But we must note that it is not always so. But when it is, whether it be colliquating, or because nature attempts to discharge the peccant matter, Physicians are not of one opinion: For the most indeed think, Purgatives may be given, but such as leave an astriction behind them. Others judge otherwise, and aright, for since in this case it is either the humours themselves, or the solid parts, that are colliquated, the colliquated matter does not require vacuation by Medicine, seeing Nature discharges it of her self; nor is it indicated by what is to be colliquated; since such evacuation should rather be stop'd: nor yet as if I thought it should be stop'd by Astringents, because if it be altogether bad, it would do more harm kept than voided, but I should recommend it to Nature, while the Physician opposes the causes of colliquation. But if the flux be not Colliquative, but Nature only attempts the excretion of the peccant matter by stool, then it will either be Symptomatick, and the matter crude and bad; or critical, and the matter concocted. If Symptomatick, it will either be moderate, or too much, from whence loss of strength may be feared. If moderate, it must neither be promoted nor hindered, for there is no cure of Symptoms, by themselves. If too much, it must be stop'd with such things as respect the peccant matter, and the present Disease. But in Pestilential fevers, wherein the Belly is not loose, some would Purge, others not. Of them that would, some presently in the beginning of the Disease, others not till the matter is concocted. They that do it in the beginning, some do it in the matter turgid, others when it is quiet. Again, some use gentle Purges, others violent. They that purge in the beginning, when the matter is quiet, fear lest it become turgid, and seize some principal part: They confirm it from *Galen*, 5 method. 12. who writes, that they who recovered of the Pestilence, which was abroad in his time, some of them vomited, all of them were loose. They add, that a crisis must not be tarried for, which comes in the state or declension; for, as *Galen*, 2 Aphor. 13. says, Most crises end in a recovery, unless the state of the Air be pestilential. They produce also the experiments of them, who, in long Pestilences have recovered Men innumerable, by giving strong Purges in the Beginning and Encrease. They that think Men ought not to Purge, are perswaded thereto, because immediately at the very beginning, there is a great decay of strength; and because Colliquation is joined with it, or an internal Inflammation, in which a Purge does a great deal of harm. Therefore the most famous Physicians, Greeks and Arabians, do not mention one word of Purging. Others add, that all the motion of the matter is to the skin, and must not be drawn inward. In this difficulty we would first of all observe this, that there is a manifold difference in these Fevers. The first is taken from the form; for one Pestilential Fever is simple, another mixt. The simple one is that which without the Putrefaction of other humours, has its rise from some poisonous putrid matter: The mixt, when other humours also do putrefy. The second from the subject, for the poisonous quality is either in the spirits, whence comes a pestilential *Ephemera*; or in the Humours, and it is humoral;

moral; or in the solid parts, and it is Hætick. The third is from the matter; for the poisonous quality may reside, either in choler, phlegm, melancholy, or blood, and they keep the periods of those humours. The fourth is from the place of the matter, whence some are continual, others intermittent: The matter of the Continual, some is in the Veins, other in some determinate part: For, according to *Galen*, we have Malignant fevers from the Brain being affected; And such also as come from the Membranes containing the Brain; and from the Lungs and Heart. The fifth from the degree of putrefaction and venemous contagion, since in most Fevers there is much putrefaction, and but little poisonous contagion, in some on the contrary: In some both are great, in some, both are little. The sixth is from the Symptoms, for some are quiet, so that they shew not themselves at all; others make the Patients very restless, especially inwardly: Some are colliquating the Belly, others abounding in Urine: Some are with Spots, others without. These things granted, we say, 1. We must not purge in a Pestilential *Ephemeræ*, and Hætick, unless there be a great Cacochymie, with fear, lest the Infection should spread thither. 2. We affirm, that all matter is not turgid, for we see it almost always remain fixt in the heart, or about the heart, or some other place. 3. This is true, where the humours are tainted with the Infection, as they commonly are, that the passages and matter must of necessity be prepared with that concoction, whereof they are capable: which we must needs say, happens in those wherein the Patients recover; because no disease can end without signs of Concoction. 4. Seeing the spirits either presently, or in a little while, sink, in this sort of Fevers, it is clear, that we must use gentle Physick, abstaining from all which favours of poison, and use such as is well corrected. But if there were burning, or an Inflammation inwardly, with chiliness of the extreme parts, purging would be dangerous: But before it come to that coldness, purging is allowed by *Hippocrates*, 2. *de vict. acut.* as is seen in the beginning of a Pleurisie, and peripneumony: Unless the Inflammation were in the natural parts, as the Stomach, Liver, &c. in which parts, notwithstanding some gentle purging is permitted, onely to evacuate the parts near the Inflammation. But that the motion of the matter is always towards the skin, as some say, is false: For from the history of the Pestilence in *Galen's* time, we see the matter crept sometimes to the Stomach, whence came Vomiting; sometimes to the Guts, whence came a Loosness; yea, we have seen it come down to the Groin, whence proceed Buboës; sometimes it has gone to the Brain, and caused putrid Lethargies, Coma's, Melancholy; sometimes it has gone to the Heart, and Swooning has followed; sometimes sudden Dropies have been bred. Whence it is manifest, that it is very good to evacuate the matter, lest it tend to some noble parts. Hence in *Hippocrates* his Pestilence, 3 *Epid.* 3. l. 80. we read, how Loosnesses cured several. Nor does it hinder, because the Infection is poisonous; for we know that *Dioscorides*, and the Ancients generally purged in curing poisons. And *Hippocrates* says, we must purge the same day in acute Diseases, if the matter be turgid, and it is turgid, when it is ready to pass out, and has no firm inclination to any one part: But in a pestilential fever, for the most part the matter abides in one certain place, and is neither ready for excretion, nor hastens to pass out. So *Galen* 6. *Epidem.* 2. tract. 9. and elsewhere, says, that it went ill with them, that had a Loosness in the beginning; but that they who had one in the state, recovered. But as for *crises*, which, according to *Galen*, they say, fall out ill in such sort of fevers, and therefore should be prevented by vaccination; in the beginning it is nothing, because they would fall out worse, if the crude matter were mo-

ved by a Purge; especially when good *crises* would sometimes follow. Therefore we may say, that we may purge in a pestilential fever; because, as *Galen* says, we must purge in every great Disease, if the strength and other things permit. But this Disease is a great one, in its own nature violent, possessing and opposing a principal part, that is the heart; and malignant. Rubeus, l. 23
9. in Cellum
c. 7.

X. Concerning Purging, we must observe this; that the seminary of the Plague (to use *Crato's* words) can be cast out by no Purgative, unless there be a great commotion made in nature, which is done with danger enough: for, although it may so be; that nature, irritated by strong Medicines; such as are made of Antimony and Mercury, may throw the vitious humours out of the body, and so cast out that poison which possesses them, and the Patients may be cured thereby, yet this is done by accident in strong bodies: But the purge it self is not primarily opposed to the pestilential poison; therefore such purges doe often harm, and by putting the Humours in motion, do cause dangerous and deadly Vomiting and Loosnesses. Wherefore there is more hope in Alexipharmacks especially, than in Purges, which if they be rightly used; there is oftentimes no need of Purges. Therefore two things should be well considered. First, The constitution of the Body should be carefully considered; and how the Patient does after he has taken his antidote, and what sort of Fever comes upon the Plague: For if the body be pure, and there be no fear of a putrid Fever, Alexipharmacks alone are sufficient, and we must doe our utmost endeavour, that the pestilential poison may be cast out to the habit of the body, as it has often been found; that Men have been delivered from the Plague by one large Sweat. But if the body be cacochymick, and the same danger in a manner may be feared from a putrid Fever, as from the Plague, after the taking an Alexipharmack, it would not be amiss to give a Purge, that some part of the matter that would conceive putrefaction, and increase the Fever, may be subtracted, to the end Nature may with more ease conquer the rest; Then we must consider, whether the Plague that is abroad, have its rise more from the fault of the Air or Contagion, or whether it do not rather depend upon some inward fault in the humours, as it happens after scarcity of provisions. If the former, there is no need of purging, but Alexipharmacks are sufficient; unless perhaps the Plague happen upon a very cacochymick body; for then sometimes purging is not unprofitable; although it be not on the score of the Plague, but onely of the putrid Fever, that would follow. If the latter, it is not onely usefull, but necessary to purge: For if bodies be full of bad and corrupt humours, they must be purged, lest they be inflamed by other Medicines, or the poison grow stronger by the corrupt humours, and disseminate it self farther, or lest those copious humours being stirred, should run to some noble part; and cause there a deadly Inflammation, and by all means lest a dangerous putrid fever should be kindled. Wherefore, if Purging be omitted, although the strength of the Pestilential poison be broken by Alexipharmacks, this Ail does often degenerate into a Disease no less dangerous. ¶ Vomits and Purges do not evacuate so universally as Diaphoreticks, and by concentrating the malignant matter they often draw Sennertius
Willis. it in, and fix it to the Bowels.

XI. Though many and strong reasons may be brought, why a purging Medicine should not be given in a Pestilential Bubo, yet because it is necessary, that we attribute much to experiments, especially in dangerous diseases, and in such wherein Art cannot be exercised; therefore in these it is necessary that we trust experiments. Wherefore I will begin with other Mens experiments, and afterwards produce my own. We have many, who at-

test they have used Purges with good success, and I am swayed with this sort of common opinion. And I know that *James Carpenfis*, the Chirurgeon, was of so great authority at *Bologna*, *Ferrara* and *Reggio*, and in my own Country, that he surpassed all other *Italians* of his time; and he, in the universal Plague of *Europe*, from the year 27 to 31 cured all that he took in hand. And I know he gave a most violent purging Medicine in the beginning and increase, when the Disease was not in the declination. Besides this, I have also another Experiment of *Gentilis*, in 4. *Canon. Fen. 1.* in which place speaking of giving purging Medicines in the Plague, he says, that the Physicians in his time used scammoniate and the strongest Medicines, with very good success, and many were cured. The authority of *Avenzoar* is subjoined, who, *lib. 3. Theistr. Tract. 3. c. 4.* gives a purging Medicine, containing a sufficient quantity of *Euphorbium*, than which there is nothing stronger in heating and drying; for it is intensely hot and dry in the fourth degree. And *Gentilis* himself attests the same. I can therefore, upon the authority of these Learned men, attest that a Purge may be given in the Plague, but I can add my own Experience, which I may better trust. In the Plague of the last year 55, I gave a Purge above 30 times, and I saw few dye. The most of them had good success, if so be the Medicine brought away a good quantity of humours, for if a small or no quantity came away, the success was bad.

Gabriel Fal-
lopius.

XII. Purging requires a second *Argus*, for as in this malignant Disease it is not very proper, so in benign ones it is sometimes very necessary. But it is not every one that can distinguish these aright. Besides also we find, that we may not give so strong Medicines, when the Plague is abroad, as when it is not abroad: for besides that the body it self cannot bear so strong Medicines, they very easily procure a dysentery.

Barbette.

XIII. I durst never give a Purge to them that were sick of the Plague before the fourteenth day, and till the Fever and the rest of the Symptoms abated. There are some that give one during the supuration of the Carbuncle, or before the *Bubo* is cured; but, whatever Antipestilentials are mixt with it, never follow their example.

Idem.

XIV. Experience confirms that a Vomit is good in the Plague, when this epidemick Disease follows a famine. Wherefore oftentimes the things that are given to sweat in the beginning, by reason of the *Cacochymie* of the first ways, usually provoke Vomit: which the use of *Pulvis Sazonicus* greatly confirms, which must be so long repeated, till the Stomach be rid of the load of bad humours by vomiting. ¶ One that had the third part of the City committed to him, which was afflicted with the Plague, cured almost all his Patients with a Vomit made of 2 drachms of any Vitriol, 2 ounces of Honey, and 6 ounces of common Water mixt together, which he gave immediately as soon as any signs appeared of the Disease being imminent or present: So that not above 10 or 12 died in his parts; whereas few escaped in the other parts.

Horstius,
l. 7. obs. 33.

Riverius.

XV. The Medicines for Cure of the Plague are either evacuating or alexiterick. The intention of the former is, that the ferous in the Blood, and the excrementitious humours that abound in the Bowels may be discharged, and together with them many particles of the poisonous infection dispersed every where in the Body. But both these Vomits and Purges, whose use is more rare, and only in the beginning of the Disease, and Diaphoreticks, which are indicated by the Plague at all times, if so be the Body can bear them, for these indeed evacuate more fully and from the whole body at once, and also by exagitating the Blood, keep it from coagulation; and seeing they move from the centre to the circumference, they drive the poisonous ferments, and the corruption

of the humours and blood far from the Heart, and force the Enemy out of his Camp: And these Medicines, whether they work by Purge or Sweat, must be such as have Particles of the same nature, rather with the poisonous infection, than with our blood and spirits. For such a Medicine passes through the divers windings and turnings of our Body, with its strength whole and untouched, and because of the similitude of them both, will more certainly take hold of the virulent matter of the Disease, and will by a mutual adhesion of parts, drag it out along with them what way irritated Nature leads. Wherefore Medicines whether Cathartick or Sudorifick, which are made of Mercury, Antimony, Gold, Sulphur, Vitriol, Arsenick and the like, are commended above all others, which seeing they are not at all subdued or conquered by our Heat, they will become very good Remedies against the poison of the Plague. For they not onely powerfully evacuate what is superfluous, but when they exert their very strong and untamed particles, and diffuse them all over the Body, they dissipate this way and that the growing ferments of the Poison, and hinder them from maturation; And since the Remedies themselves, insuperable by nature, must of necessity be discharged by some open passages of the Body, they carry out along with them whatever extraneous or hostile thing comes in their way.

Willis.

XVI. Malignant fevers, although they be destructive to many, yet they are so long private, till the Putrefaction have got the degree of Malignity, that a morbid expiration flies out, and they so become contagious: And this degree is not any mere Putrefaction, but rather a substantial Corruption, which the Seminary of the Contagion follows, which comes not from Putrefaction alone, but from a Malignant quality, wholly adverse to Nature, and therefore, unless it be suddenly removed, it removes the Man. Therefore in these Fevers we must have a care not presently to use violent hot expulsive things, such as are given in truly pestilential ones, proceeding from inspiration, which are cured by sweat and transpiration, when expulsion alone, and opening the passages, and strengthening the Heart is sufficient, and such things as resist putrefaction, unless Nature disburthen her self by breakings out, in which case expulsive things, but not strong ones, are proper. Therefore Physicians commit a great error who do not at all distinguish between private and publick contagious and not contagious Diseases; so that of a private pestilential Disease, a publick is often made, by their unskillfulness who increase the Putrefaction, and weaken Nature by strong Medicines (for private Pestilential fevers do then become contagious, when the Putrefaction is arrived at that degree, as to have a morbid expiration, in its whole substance, as a poison destructive to humane kind.) Certainly when Nature expels nothing in the Disease, nor Swellings nor Spots appear, how shall the Physician, Nature's servant, dare any such thing, and presently fly to drivers out and Sudorificks (to say nothing of hot Medicines) in the cure? Whereby oftentimes in them that are not infected with a pestilential Seminary, the humours fly to the Head, whence come *Deliria*, increase of the Fever, and diminution of the strength of Nature, which alone cures Diseases. And although oftentimes from this cause Spots appear, it does not therefore follow that they come from infection. Although when the reason is truly pestilential, and there are Seminaries in the Air, all Diseases contract malignity.

Crato.

XVII. I observed in the Pest at *Berne* which was abroad anno 1629. that Essences, Waters, Elixirs, and very hot Medicines of false Chymists did harm to many, if not all (that it was my fortune to see) and did but very few good: For by them the bodies of our People, who feed on flesh, fare high and

and live idly (and therefore are either plethorick or caco-chymick) were rendred very fit to receive the poison.

XVIII. I have several times experienced *Bezoar* stone to be most excellent both in my self and other sick people. It is two fold, Oriental and Occidental: That is preferred, if it were genuine; for it is usually so artificially adulterated, that the cheat can scarce be known. Wherefore I am more willing to use the Occidental, because it cannot so easily be adulterated as the Oriental: For seeing it consists of many shells or scales, I cannot see how Art can easily imitate Nature. When I and my Wife were last Summer taken with the Plague, I used the Occidental with good success.

XIX. It is questioned whether *Bole Armenick* be good for the Plague? If we had *Galen's Bole*, which he so highly commends, for drying without astringion, I should count nothing better: But this of ours (which all Learned men do now agree is red Ochre) dries with Astringion. Wherefore lest a dangerous Error should be committed, I think it best to abstain. We may instead of it use burnt Hart's-horn, &c.

XX. I say Treacle is very convenient with this distinction. The Pestilential fever either offends more in a manifest quality, I mean in Heat, than in an occult, that is, a poisonous one. It is indicated by great Thirst, a dry, rough and black Tongue, Heat sometimes apparent to the Touch, (for these Fevers are often gentle to the Touch) then I use to deny Treacle. Or, it afflicts the sick more with a poisonous than a hot vapour, which may be discerned by the absence of the foresaid Symptoms, and the presence of some Symptoms which favour of Poison. Then I give Treacle with great success. Or thirdly, the poisonous and hot qualities are equally joined, which I know when the accidents favour of Heat and Poison alike, and then I prescribe Treacle, but corrected with Conserve of Roses, Violets, the acid of Citron, &c. What I have said of Treacle, I would have the same understood of Mithridate. ¶ In that many mix Treacle with Frankincense, I cannot commend them, because the Head is often oppressed, therefore the matter must be diverted from that part.

XXI. The use of Spirit of Vitriol is rejected by *Johannes Baptista Sylvaticus*, first, because Vitriol, according to *Galen* and *Dioscorides* is of a corroding and sceptick quality, but such a Medicine is not safe in a pernicious Disease. I answer, That all things are not competent to the Spirit, which are so to the Vitriol. All that is drawn from a thing does not retain the nature of the primigenial substance, therefore it cannot possess the same qualities: Many parts of the Vitriol are separated from the spirit in preparation: The Spirit alone has a corroding quality, but not when mixt with other things, this is common to it with Vinegar, Juice of Lemons, &c. Mineral Waters have their virtue from Vitriol, yet they are beneficially drunk. Secondly, The frequent use of them is suspected, which is otherwise necessary to conquer so great a Disease. I answer, There is no danger, if it be mixt with convenient liquours. Thirdly, It will create Nature a Trouble, and divert her from her work, because it is an efficacious Medicine in a small quantity. I answer, It will hinder no more than the Physician, while he resists the Caco-chymie with Medicines. Fourthly, Physicians say, It is exceeding hot. I answer, The Heat is corrected, when its Atoms are separated by the mixture with another liquor, in such a proportion, that an hundred Atoms of Water are intermixt with ten or twelve of Spirit. Fifthly, *Galen*, 10. Method. suspects the use of Vitriolate waters in Putrid fevers, because applied to the Skin, they cause an Astringion of the Pores, and impart Heat to the Body. I answer, he rejects their external use, because Transpirati-

on is hindered by them. Sixthly, There are other safer Medicines, which resist Putrefaction. I answer, it is a safe Medicine, taken in a just measure and with judgment. There are infinite Witnesses of its benefit, few say, it does harm. It is not yet made appear that there are safer Medicines. Seventhly, The excessive Astringion, which is found in the Vitriol, is found also in the Oil, but Astringents are hurtfull in Fevers. I answer, It is not so great as to do hurt, there seems rather none to be in it. But all Acids do not bind, but attenuate, deterge, and open obstructions: However, grant it do bind, there is no danger from thence, because the attenuating, cutting and deobstruative parts prevail. Eighthly, although it resist Putrefaction, open Obstructions, and cause plentiful Sweat, yet it is not proper in Pestilential fevers, because it acts not safely, seeing by its Acrimony it increases the Fever and does violence to Nature. I answer, I deny a noxious sudorifick virtue joined with its heat and attenuative virtue; it is not used as an Hydrotick, but as a Resister of Putrefaction; nor does it hurt in heat, if it be well diluted. Ninthly, the Mine is uncertain, from whence the Spirit should be drawn, and Chymists do not agree which they ought to chuse. I answer, They do agree, that the *Gossarian* is proper, but that the factitious, which is made of *Mars* or *Venus*, is more noble, and that the *Hungarian* is most noble. Tenthly, there is a disagreement among them about its form; some call it Oil, others Spirit, and others Water or Phlegm. I answer, This distinction is known to skilfull Spagyrics: The Oil is for the most part thicker, nor need any danger here be feared. Eleventhly, the preparation renders it a dubious Medicine; for it is either drawn without addition, or it has something mixt with it, so that we know not whence the effect comes. I answer, It makes no matter, whether it be subjected to *Vulcan's* trial with other things or alone.

XXII. He that contends, there is no *Alexiterium* for a pestilential poison, overthrows the Principles of natural Philosophy, from which it is evident that all things are made of contraries by contraries, and that the vicissitude and instability of humane matters does depend on the repugnance and disagreement of principles. Since therefore the peculiar Remedy for the Plague, and the proper Alexiterick of the poisonous Bane, does yet lye hid in Nature's Womb, we must of necessity fly to the common Alexitericks for Poisons, and to Cordials.

XXIII. Although it be certain that one Remedy has given relief in some one pestilential constitution, yet it has been found to be useless in another; which must be ascribed to the diversity of the pestilential poison. Therefore some have likened it well enough sometimes to the Nature of a Viper, Hemlock, Monkshood, and sometimes to the nature of the Asp. See *Quercetan*, in *Pestis Alexicaco*. *Sennerius* says this is very usefull, to perform the Cure aright. Hence perhaps, the specifick Remedy being unknown, so many hundreds of Men dye, when only the vulgar Antidotes, Treacle, Mithridate, &c. are given: that is, the specifick nature of the Plague not being known, before several have died. Therefore we must not insist on one Remedy, but they must be varied, till a certain and specifick one be made manifest.

XXIV. Juleps are very necessary, yet we may not use them every where and always: I never prescribed them without adding Sudorificks, which the sequel will declare, and this is the safest way: For if the Patient use a simple cooling Potion, when the Sweat runs plentifully, both the Sweat often returns inwards, and the Poison is communicated to the Heart, whence at length Death follows.

XXV. The Sweat as it runs must be wiped off with a warm linen Cloth, and such another linen Cloth must be put to the Breast: for I have hither-

Barbette.

to observed, that Shirts, and other Linen, is never changed, but with great harm, yet its excessive moistness sometimes compells us. ¶ Let the Patient, when he has taken this Medicine, compose himself in bed to promote a Sweat, covering himself moderately, that is, with so many Clothes, as he can bear, without tumbling. After half an hour, let him take some Broth, or Beer, or Wine warm, and let this be repeated ever and anon, till you find some evacuation or other follow, and that sufficiently. But if after an hour or two none follow, nothing hinders to give the Patient a new Medicine, nay, upon urgent hazard, a third. For this you must take notice of, that unless after taking a Medicine, whether sudorifick or vomitory, either Sweat, or Vomiting or Purging do follow, or the Anxiety of the Heart be removed, or at least diminished, the Patient is in very great danger: for it is a sign, that there is a Pestilential poison either copious or very volatile, or very sharp in the Body, wherefore there is little hope. But, on the contrary, if there be Excretion either upwards or downwards, or at least plentifull Sweat, and the Anxiety of Heart and Loathing abate, and the Pulse grows greater and stronger, we may hope well of a happy Cure: And that it may be hastned, both during the Sweat and when it is ended, Cordials, mixtures consisting chiefly of Acids, may be given the Patients by spoonfulls, at short Intervals; to the end the Acid that is destroyed in them, may be restored, and that its consistence may be kept or restored to the Blood, without which it is not possible for any man to remain long alive. And still as long as any sign of the yet urgent Plague remains in the Patient, so long you must persist in Medicines, that fix a volatile Salt, temper a sharp one, and restore the Acid, lest the Poison, neglected and left to it self, recruit its strength, and surprize the too secure Patient unawares, and take him off. Certainly by this way and method I have successfully cured many Patients: But when it was neglected, I have seen many perish, and oftentimes the wilfull and careless, although I admonished them in vain, and so satisfied my own Conscience.

Idem.

Rosaceus.

XXVI. Sudorificks must be taken twice at least every day; yea, it will doe a great deal of good to use them thrice in 24 hours time. There are found some who in the space of 6 hours give a new Sudorifick, with great success. Nor is there any reason slightly to desist from the practice of these Physicians, although the Patient cry, he is well: for in a short time it will appear, the Disease has cheated you both. ¶ Who causes not a Sweat four times or oftner in 24 hours in those that are taken with the Plague, truly he will doe but little good.

Barbette.

XXVII. Diaphoreticks and Cordials, especially Acids, are in this case highly necessary, most certain, and therefore are the best, for they bring consistence to the blood, expell malignity, dissolve phlegm, in the stomach and guts, temper bile, the cause of many mischiefs. Nevertheless the variety of the Disease and its symptoms require them to be variously changed, because otherwise they would not perform what they are able to perform in an acute Disease.

XXVIII. Seeing the Pestilential poison should not onely be expelled, but moreover, does upon the account of its volatility and lixivial acrimony, indicate its alteration and correction, that is, its fixation and contemperation, we are not without reason solicitous about the matter of the Remedy indicated, and which especially fixes the volatile Salt, and contempers the sharp. And I scarce know any such among Vegetables which are able to doe it, nor among Animals, so that we are forced to have recourse to Minerals as to our last refuge: Among which, it may be, Tartar is one, or rather its distilled Oil, but because of its foetidness, and seve-

ral other reasons, it cannot conveniently be made use of. But among Minerals Salt-petre or Nitre can doe much towards the fixing of Volatile Salts: for who knows not that Arsenick, Orpiment, Antimony and such like things, consisting of a volatile Salt, are fixt by the benefit of Nitre, as well crude, as first changed into an acid spirit? It may therefore be used with good success in the Plague. But the most excellent thing, and which is worthy of a farther search, is mineral Sulphur, and that first fixed by Art, whose excellency and efficacy in fixing a volatile Salt few have observed. And I commend it to all men, and I advise them to learn to prepare the best, out of any subject whatever: for they will have a most gratefull and excellent Medicine in the Plague, and in very many other Diseases, not onely fit to fix a volatile Salt, but also to temper the same, when it is too sharp.

Sylvius de le Boë.

XXIX. Whether Garlick be convenient in the Pestilence for prevention and cure? As for prevention, if any one be accustomed to it in health, without doubt it ought not to be left off, for it were a piece of imprudence to leave off a custome in a pestilential constitution, because it is not lawfull then to give an occasion of being sick. But if he be one who sometimes uses Garlick and sometimes not, and neither finds his Head ake, nor himself hotter than ordinary after the use of it, it may be allowed him, I think, as he used it otherwise, especially in Winter time. Reapers may serve for an instance, who eat it with bread in the heat of Summer, that they may be the less offended by the heats; and sweat the less, for they better withstand it, who use Garlick, than they who abstain. Moreover it defends mens bodies from external Cold, and renders them less obnoxious to it. It performs this not by its quality alone, but as it strengthens the innate heat, so that the body afterwards is overcome with more difficulty by any cause whatever. But they who have not used Garlick; it is not safe for them to begin to accustom themselves to it in a pestilential constitution, as neither it is for them that are of a hot constitution, of a thin habit of body, Children, weak People, and they whose bodies easily waste: but they that are of a gross habit of body, of a cold constitution, and difficultly waste by transpiration, I think, they may obtain their desire in Wintertime. Besides, according to Hippocrates and Galen, 4. de 1. Viâ. it excellently preserves a man from surfeiting; and how much this disposes mens bodies for any external impression, the ill habits declare, which arise from thence. Then Dioscorides assigns great advantages to Garlick against the change of Water, both for prevention and cure. Moreover, we know by long experience, that Garlick strengthens the natural heat, raises an appetite, sharpens concoction and the rest of the natural Actions, and does not suffer the meat to corrupt; And Bodies suffer the quite Contraries to these things from the Plague; therefore, for the said Reasons, we may give Garlick with meat to him that is sick of the Plague. But if you consider it is drying, as Dioscorides writes, and that in the Pestilential fever there is a bad humour in the stomach, whereby all its actions are corrupted, especially that whereby meat is concocted, and that whereby it is retained, will you therefore reject it, because it heats more than it ought? By no means, because the Patients suffer less harm from the addition of heat, than of the pestilential putrefaction. Besides, the Heat is not in the earthy part of the Garlick, as the heat of a bitter thing, but it is in the watry part, which presently is dissolved into the habit of the body, passing immediately from the inner to the outer parts, a thing which does not a little good in a pestilential Fever. You will object, that Hippocrates, 4. de v. acut. says, that Garlick breeds Wind, Heat in the Breast, Head-ach, and Loathing of meat; But Galen asserts the

the contrary, being taught by experience; nay, he says, it cures the Head-ach, if it be given after evacuation. Therefore I advise all that are sick of a pestilential Fever as a most wholesome thing, to mix Garlick with their meat, that by its drying, and strengthening the natural Heat, it may resist the deadly prevailing corruption; and that it may discharge what is corrupted by the way of Urine, or by its violent motion to the circumferential parts, as well as for these of the Symptoms in the Stomach, vomiting and loathing meat, yet still observing custome, and the violence of the febrile heat, according to the age, complexion, and season of the year. Nor must it presently be rejected because of some contrary quality: for Galen says, It is difficult to find any thing that does greatly profit without hurt. And, as Avicenna says, the heat of Garlick vanishes in boiling; wherefore he that would use it whole, let him boil it with meat without any other Preparation; if one would break it, let it lye a day in Infusion in Vinegar or Juice of Sorrel. Besides, they say, Garlick drives away fear, which very much afflicts and wastes the spirits of such as are seized with a pestilential Fever.

XXX. Where there is great pain of the Head or Stomach, and the Patients do not sleep, Camphire must be used cautiously: Otherwise this is as it were the Vehicle of other Medicines, and makes them penetrate all over the Body and oppose themselves to the pestilential poison: yet a great quantity of it is needless, two or three grains may be sufficient.

XXXI. Let Rose or Rue Vinegar be smelled to, or let Citron rind be held in the mouth: For they who for preservation would guard themselves with Zedoary and Cloves, doe themselves a great deal of hurt.

XXXII. I know this, that Opium has a special virtue against the Plague; Wild-nightshade testifies this, which is a most effectual Remedy in the Murrain of Hogs, as Tragus writes, and, it has the virtue of Opium. ¶ I judge Opium should not be added unless to the hottest Antidotes, but such they commonly are, which are given in the Cure of the Plague; for, to omit other things which take Opium expressly into them, the noble Pulvis Saxonicus, good against Poisons, has the fruit and leaves of Herb Paris, that is, the Aconitum primum Fastidii, which cools no less strenuously than Opium; And this Antidote, as I hear from experienced persons, does abundance of good in the Plague. And Electuarium de ovo has Nux vomica in it, to which I find cold in the fourth degree attributed, notwithstanding I am as yet doubtful. ¶ It is wonderfull also that these things, how bitter soever, yet are not at all cold, as the Cocculi Levantici. This also is wonderfull, that these exceeding cold things should cause Sweat, as I have often observed. ¶ But seeing distilled Remedies seem to be preferred by me, because they sooner penetrate; and in the Plague there is need of quick penetration; Yet I would not mix soporiferous things, as Opium and the like, with other distilled things; both because I would not have them penetrate to the Heart, and because such things distilled seem to me to be made worse, and more hurtfull to our nature, but not hot things.

XXXIII. In the year 1645. the Plague (though not a cruel one) was abroad: And Dr. Henry Sayer, when others refused the charge, did boldly visit any that were sick; he gave them Medicines every day, he handled with his own hand Buboës and virulent Ulcers, and he cured several sick people. That he might guard himself from the Contagion, before he went to any infected houses he onely used to drink a good draught of generous Wine, then when he had finished his perambulation, about the very threshold of Death, he used to repeat the same Antidote. But within a short time, being so bold as to lye in the same bed with a certain Captain

(whose company he intirely loved) who was taken with the Plague, nor then did these Arts profit their Master, which had been of so great advantage to all other men, but he died of that Disease, much lamented of all that lived thereabout. About others, that were infected with the Plague, his method of Cure was usually this; If Spots or Buboës appeared not, till after he was called, for the most part he gave a Vomit, the Prescript of which was of infusion of Crocus metallorum, with sometimes white Vitriol, sometimes Roman. When the Vomiting was over, he ordered them immediately to be cast into a Sweat by Diaphoreticks; and afterwards the Sweat to be continued till the declension of the Disease, allowing some intervals for gathering of strength: But if the Tokens appeared before he was called to his Patients, he let Vomiting alone, and insisted onely on Sudorificks.

XXXIV. If in any Disease, certainly in the Plague, a most acute and very deceitfull Disease, and a malignant one, we ought to have an exact care of the sick, and not think, as soon as the more troublesome and sensible symptoms seem a little abated, that the Disease likewise is cured; for if it be left to it self, and so neglected, it undermines and surprizes the Patient unawares. Therefore I would seriously advise all Physicians, not easily to trust the Plague, however some Symptome that was formerly troublesome to the Patient, seem to be removed; for there is always a Snake in the grass, which daily kills the unwary before they think of it.

XXXV. Cauterics doe excellently well for prevention, and many Clinicks by benefit of them remain untouched, and handle them that are infected with the Plague without harm. But in the Cure we reject them, because, before they give any relief, which is after the tenth day, the Patients are carried off by the violence of the Plague.

¶ I commend after the customary Purging of the whole body, to them that are very cacochymick; the burning of the Legs or Arms with a red hot Iron, that the bad humours may constantly be diverted from the Bowels. And practice has taught us, that they are rendered the safest from the Plague, whose serotum has been run through with a Seton. ¶ Galen, 5. meth. cap. 12. writes, that in a certain pestilence of his time, all they escaped, whose bodies were full of Sores. Mercurialis testifies, that he never saw a man dye of the Plague who had a Caution. They are therefore reckoned usefull by Massarius, Mercurialis, Nicolaus Florentinus, and Fabricius Hildanus, made either in the Arms or Legs, that the ichor may continually run out by them. But the application must by no means be deferred so long, till the Plague increase and gain strength, for otherwise there were fear, lest the Ulcer should conceive Malignity and Inflammation. Therefore it is advisable to apply them in the beginning of the Plague. But to what place? Some will have them made in the Calf of the Leg, for so they think, the humours are evacuated downwards, and a greater revulsion is made: Others will have them made in the Arms, because then they are nearer the Heart, to which the Pestilence is an open enemy, and therefore a better derivation of the humours. Paræus, 1. 21. c. 2. decides the Controversie. Men must at the very first moment take away by the purging and bleeding the humours that are apt to conceive the seeds of Putrefaction and the Plague. They must suffer two Ulcers to be made in themselves, as outlets of the excrementitious humours, which are dayly bread, One in the right Arm, a little below the Epomis muscle, The other, three inches below the Knee, on the outside of the left Leg.

XXXVI. Herculanus is reckoned the first of all men who thought fit to apply Cauteries in time of the Plague: Yet this Remedy seems to be taken from the veterinary Art: For Columella, to keep

the Murrain and Contagion from Cows, orders their Ears to be boared with a piece of *Confligo*-root, a sort of Hellebore: Which is observed by Cattle-keepers to this very day. But as to the time, they must not be deferred till the Plague increase and get strength: for then the Chirurgeon might fear lest the Ulcer might become malignant and inflamed, which many Learned Physicians do attest oftentimes to be true. Therefore it were more advisable, to apply them when the Plague begins to appear, and while its pernicious fruit is in the bud.

Glandorpi-
us.

XXXVII. That Salt has the principal place, its Use shews, whereby it preserves bodies a long time uncorrupt. We find in it exsiccation, penetration and astringent. All sower things have the second place, among which Vinegar first offers it self, then Juice of Orange and Juice of sower Pomegranates: After them are bitter things, but because they are hot, they are not so proper. New Eggs are of most easie concoction, and yield matter for the generation of Spirits: Lest therefore they be converted into pestilential matter, it will be proper to give them in this manner. Put a new Egg whole into cold water, mixt with vinegar, and there let it be three hours; then break the Egg and pour out the White, and fill up the empty space with Juice of Orange or White-wine-vinegar; add as much Salt as will make it indifferently salt; roast it on hot ashes, and stir it till it grow thick. Also draw a young Partridge, Pheasant, or Pigeon, and season it moderately with Salt: Let it remain so one day in Summer and two in Winter; afterwards put in pieces of Citron and Parsley-leaves, to fill up the hollow of the Fowl, and roast it at a gentle Fire, and when the moisture comes from within outwards, and the Fowl begins to be moist all over, strew Salt all over it, and when it is indifferently roasted, take a little of the moisture that drops from it, on your finger, and try whether it be salt; and if not, strew Salt on it again, till at length the gravy be pretty Salt. Let the Fowl be at the fire till the moisture be dried, then take it from the fire, and cut it into small pieces, and put it into a linen cloth, and let all the Juice be wrung out between two people straining as hard as they can; and give it to the Patient. Indeed it nourishes much, increases the substance of the Spirits, strengthens the Stomach, and very much resists the pestilential infection. You may doe the same with a Capon or Pullet. Nor let any one wonder why we make an Egg and the Juice of Meat salt on purpose. For when the Objectour considers with himself, that a pestilential Fever does particularly corrupt the natural Actions, namely, of the Heart, Liver and Stomach (as is demonstrated by Vomiting, Loosness, red troubled Urine, and by a disorderly Pulse) and that the pestilential infection is soonest communicated to those parts that are moistest (for moisture is the maintainance of the pestilential Contagion,) he will think what we have said is not without reason. For we know that those parts that are infected with the pestilential Contagion, are preternaturally moist, and that for that reason their actions are lost. Wherefore the food ought either of its own nature to be dry, or if such for its hard concoction be not proper, such things as may dry, must at least be mixt with it. But Salt, as we have said, is the most effectual of all things against all corruption, and most familiar to mankind. Wherefore a rational method shews that all salt things are proper for this Fever. Nor must they therefore be rejected, because they breed thirst.

Brudus.

XXXVIII. Besides, in a pestilential Fever we must take diligent care of the Stomach, that the Patient may be able to retain what he takes, otherwise we can neither help the strength, nor oppose the disease. Wherefore my reason tells me, that Salt-fish would be of use, if it be such as is

easily concocted: for it is certain that it dries the stomach exceedingly, causes an appetite and immoderate thirst, settles a subverted and nauseating stomach. As I was writing these things, it was told me, that an old Chirurgeon in England used successfully to feed people sick of the Plague, with Salt-fish, which the English call Herrings (the French, *Anchoyes*) which if he cannot have, instead of them he uses a less sort of Fish, which take the Salt and Smoke better. But you must warn your Patient to abstain from drink till an hour after eating of them, but afterwards give him as much cold water as he can drink at one draught. The use of such Fish is most effectual against the thin corrupt humidity in the stomach. And how much such Salt-fish strengthens the stomach, represses loathing, and causes an appetite, their very smell declares, whereby no small appetite is procured to the stomach. He therefore that is content with these reasons, let him use them broiled, being steeped in Vinegar or in Juice of Sorrel.

Idem.

XXXIX. It is a difficult thing to prescribe a Diet for these Fevers. For a thin one is not convenient. 1. Because it is given, that Nature may be at leisure to fight with the morbid matter: But in pestilential Fevers it is our onely care to prevent a War between Nature and the pestilential Humour, because usually in such contest Nature is overcome. 2. A Diet that is thin and easie of concoction, is sooner overcome by the violence of the pestilential Contagion, than by Nature. Wherefore although it were very usefull and necessary for the breeding of Spirits, which in such Diseases Nature most loves; yet in this Disease we may not use it. And gross Meats must not be given, because they cannot be overcome of the natural heat, as being languid, also because they do not afford matter for spirits, and they add to the cause of the Disease, although they be necessary for a greater resistance against corruption. For which reason I advise, to mix such things as afford most plenty of spirits with such as resist the pestilential Contagion. Such as it is evident they are that are dry by Nature, and immerge themselves deep into the body with a quick penetration, communicating a drying faculty to the whole, with a little astringent. Wherefore Salt and all salt things, especially such as are of a thin substance, as also all sower things, are admirably good. They indeed increase the Fever, but it is better to stop putrefaction and repair the substance, than not to heighten the Fever. Nor is it contrary to reason to increase thirst, for it is desirable, because, 1. It shews that the action of the sensory faculty in the mouth of the stomach is perfect. 2. The Patient will be delighted with cold water, and he may drink plentifully of it, which is an excellent Remedy.

Mercatus.

XL. But it is not advisable to use Salt-flesh, which the Northern part of Spain uses, because it is hard of concoction: Yet it were better to use the Juice of it when it is well roasted. The Juice of Flesh breeds abundance of Spirits, and strengthens the Stomach. Therefore it must be our great care, that we doe not offer the same meat so often till the Patient loath it. Wherefore the Physician should think with himself of divers meats, that he may use every one of them, when it is proper. All sweet and unctuous things, whatever is hot and moist, should carefully be avoided. Lentils, with much Vinegar, Salt, Saffron and Parsly boiled, are convenient.

Brudus.

XLI. *Celsus*, lib. 3. c. 7. orders the giving of hot and strong Wine in the Cure of a pestilential Fever. Which we must think was observed by him or by Physicians before him, in the peculiar and particular nature of some Pestilence. For even in our age many were sick of the Plague and recovered, who had a great desire to Wine, and acknowledged they did receive great benefit from Wine, and they

they said, they never found greater relief, in the very height of the Disease, than when they drank Wine: which their Physicians also confirmed, whereas otherwise, although it restore strength and spirits, yet it is manifest it is very hurtfull by reason of its heat. Therefore *Galen*, in giving *Bole Armenick*, which is cold and dry, distinguishes carefully whether there be a Fever or no, and whether it be small or great. And whereas several Physicians write, that Wine must not be given, because it carries the Poison to the heart, and opens a passage thither, this reason does not hold, because otherwise it were not convenient in Poisons, when yet *Dioscorides* not only permits it, but commands it, even to be taken liberally, against the biting of Serpents, and all wounds which hurt by cooling. But what can the nature of the Pestilential fever be, wherein *Celsus* commends Wine? Certainly it must be such, wherein there is much poison, and very little putrefaction, and that in cold matter: For sometimes in pestilential Fevers, the putrefaction is so remiss, that it is almost none at all, and yet the pernicious, or evil quality, is very intense.

XLII. If the Patient be troubled for several days with a costive body, with anxiety of heart, Can a man expect relief from a Purge? Costiveness is not the cause of the Anxiety, but the poison it self; Therefore proceed to give Sweats, strengthen the Heart, and be not greatly solicitous for the Costiveness. But if you have a mind to loosen, let a Suppository be used, for the use of a Clyster is not so safe: This hath done many harm at this time, and others little good, while in the mean time it no way resists the malignity. But if you will neglect this admonition, which is confirmed by experience and reason, and have a mind to give a Clyster, abstain, I pray, from Scammoniates, especially in Women and Virgins, that have their *Menstrua*.

XLIII. The appetite of meat decayed may be restored by Acids, any way taken, and especially with sweet Spirit of Salt, and *Elixir proprietatis*, either mixt with the ordinary drink, or used with cordial mixtures. Where note, that since the Pestilential poison, for the most part, uses to exert its deleterious quality in a few days, it is not worth the while, for a Physician to be solicitous for restoring the Appetite immediately in the beginning, because when poison is conquered by Acids, the Appetite returns of its own accord: but if it comes slowly, it may be repeated by often using the things aforesaid.

XLIV. Let them for whom it is expedient to fly, prudently beware, that they be not forced to make their journey through a Pestilential Air: because it has so fared with many, that while they contrived to prevent danger, by their flight through a Pestilential Air, as soon as they came to their desired Country, they immediately died; or because, while they make their journey with more haste than usual, they are tired and weakened; and the humours are immoderately moved and troubled, whereby they are the readier for the susception of a noxious quality. There happens also from their travel, a necessity of breathing oftner and larger, by reason whereof, the poisonous Air, such as it comes, is more plentifully received. Besides, every sudden change is grievous to nature; and the humours in several plethorick and cacochymick persons are heated beyond measure in their journey, and when they are hot, they put on a noxious quality. But he that withdraws himself from the infected Air, must go, before the Calamity overrun all his Country, into some part differently situated from that where the Plague begun, but a gentle pace, for fear of the foresaid disturbance.

XLV. I remember that the Chirurgeons in France, in the time of the Plague, put on a singular Habit, not made of Cloth or Wool, wherein the seeds of the Poison might easily stick, but of Line, compressed

and smooth, which they put off at their return from their care of the infected sick. The *Italians* use the same artifice, and I am told, that in the late Pestilence at *Rome*, which destroyed the City Anno 1656. the Physicians were clad in a singular habit. They carried a Staff without a knot in their left hand, as a mark of their conversing with infected persons. They had a Mask covered with infected persons. They had a Mask covered with wax all over their Face, and their Head too, that their Hair might not take the Infection. They had Glasses before their Eyes, and their Nose was inclosed in a long Snout, full of Alexipharmacks and good scents. In this necessary and safe, rather than decent Habit, Physicians visit the Infected, and Chirurgeons safely handle Buboes, and feel the Body when it is full of Spots; and if they found the spots bunch out, and the Hickup come upon them, they foretold certain death, which was a certain sign of death in the Plague in our City, Anno 1619, as a Th. Bartholinus, cent. 5. ch. 67. Chirurgeon, who was hired to cure the sick, affirmed to me. ¶ To these things you may add one thing more wonderfull, if those that visited the Infected, did constantly carry in their hands burning-Torches, or live Coals, they were safe from the Contagion, as *Marsilius Ficinus* affirms. *Epid. antidot. cap. 24.*

XLVI. Let the place, in which the Patient lies, have a hole open above, that the Pestilential Vapours may fly out especially while he sweats. This hole may be opened and shut by turns: for when proper Fumes are made, with Camphorate Rose-water, and other things, the place may be shut, and then opened again.

Sydenham's way of curing a Pestilential Fever.

XLVII. As for the cure of these Fevers, the first place indeed is owing to curatory Indications, which in general must be this way directed, that either following Nature's Guidance exactly in exterminating the disease, we may lend it a helping hand; or not at all relying on that method which Nature is accustomed to use in subduing this intestine Enemy, that we may go upon a different one. If any one reply, That the business may be done by Pestifugous Alexitericks: Yet it is doubtfull, whether the good they doe should be ascribed to their manifest quality, by which, in causing Sweats, they also open a way for the morbidick matter; or, to some occult disposition, which Nature has bestowed on them, to extinguish the pestilential Infection. Wherefore, first of all, let us consider the former Intention, which has this tendency, that Nature may be helped, in her own way and usage, to exterminate the morbidick matter. We must observe, in the true Plague, that Nature, if she be neither forced, nor do err, does her business by some Abscess, breaking out in the Emunctories, whereby a passage is made for the matter: But in that they call a pestilential Fever, this is done by the whole superficies of the body, by means of Sweat and Transpiration. Whence we may gather, that according to the different way and course, that Nature foreshews you, a different method of cure ought also to be taken. Namely, if one endeavour to discharge the matter of the true Plague, by means of Sweat, he goes a way contrary to Nature, which endeavours it by Imposthumes: And on the contrary, he that tries to discharge the matter of a Pestilential fever any other way than by Sweat, he takes a course not at all agreeable to the duct and inclination of Nature. But in the true Plague it does not as yet appear, with what proper and certain sort of remedy the ejection of the morbidick matter, that is, the breaking out of Imposthumes may be promoted, except one should think, that a strengthening Diet, and Cordials, might conduce to it: Which yet I should much doubt, whether they might not cast the Patient, who is too hot already, into a far greater heat.

I have

Montanus.

I have by experience found it certainly true, that Sweats in this case are to no purpose, although I cannot deny, that after great Sweats, of three or four hours continuance, and then broke off, the Swelling does appear; which I do not think proceeds from the Sweat, because while it lasts, no sign of Breaking out appears; indeed when the Sweat is ended, it may, by accident, appear; that is, when Sweat has taken away some part of the burthen, which loaded Nature more than it should, and when the body is put in a violent heat, by taking of things to cause a Sweat. But how fallacious and treacherous the extermination of this peccant matter, by Imposthumes, forced out in Sweats, is, I call to witness the tragick ends of such as have been thus treated, of whom, scarce the third Man escapes the danger of the cure and the Disease: But on the contrary, many, who have had their Swellings break out in a laudable manner, have recovered their health in a short time. But that the Crisis of this Disease, by tumours, is very hazardous, is manifest from hence, that sometimes a Bubo, which at first broke out laudably, and with the abatement of the Symptoms, does afterwards, all on a sudden, disappear, and instead thereof Purple Spots, most certain tokens of Death, do succeed. The cause of whose striking in seems of right to be attributed to those great Sweats, that are designed to promote the Eruption, because they, by drawing and dissipating, do disperse another way, by the habit of the body, that good part of the matter, which should fill and keep up the bulk of the Swelling. However it is, this at least is most certainly sure, that out of God Almighty's great benignity, there is a certain way to remove the morbid cause in other diseases, but in this the way is but slippery and inconstant. From hence it follows, that the Physician, who in the cure of other diseases is bound to follow Nature's duct and propensity very close, must here refuse its guidance.

Wherefore, since it is by no means secure to tread in Nature's steps, in exterminating this Disease, we must now look about us, by what means we may satisfy the second intention, that is, of endeavouring another, and a different solution from the natural. And this, I think, may be done two ways, that is, by bleeding, or by Sweating. As to the former, I am not ignorant that many make conscience of Bleeding: But not to heed the prejudices of the Vulgar, I first of all appeal to those Physicians that stay'd in London in the time of the late Plague, whether any of them observed, that plentiful and repeated Bleeding, before any Swelling appeared, proved mortal to those that were sick of the Plague? We need not at all wonder indeed, that the letting of a little blood, when the Swelling begins to appear, is always hurtfull: Because when only a small quantity of blood is taken, hereby the management of the affair is taken out of Nature's hand, which applies her whole strength to the protrusion of the tumour; nor is there any other way of evacuating the morbid matter, efficacious enough, substituted in its stead. And when the Swelling already appears, and blood is then let, seeing it draws from the circumference to the centre, it causes a motion quite contrary to the motion of Nature, which is from the Centre to the Circumference. But, that bleeding in the Plague is convenient, many grave Writers have long ago adjudged. But there is onely one that I know of, who places the whole business of the cure, such as we require, in bleeding plentifully, that is, *Leonardus Botallus*, a most famous Physician of the last Age, I, saith he, think there is no Plague for which this may not be more wholesome than any other remedies, so it be used opportunely, and in a convenient quantity: And I think it has sometimes proved successful, because it was used either later, or less than was necessary, or because there was an error about using it in both respects. And a little after. But in so great a timidity, and spare

detraction, how can any one rightly judge, what good or harm it does in a Pestilential Disease? For the Disease, for whose cure the taking away of four pounds of blood was necessary, in which onely one is taken, if it kill a Man, does not therefore kill a Man, because blood is let, but because it was not let in a just quantity, or it may be not seasonably. All which he confirms by experience, and goes to examples of cures. But here I will relate a very rare history of a matter, as it was acted with us in England. When among the calamities of a Civil War, the Plague also raged in several places, and, by chance, was brought from some other place to *Dunstun-Castle* in *Somersetshire*; after some of the Soldiers had died suddenly with Spots, and it had seized several others, a certain Chirurgeon, who was returned from travelling in far Countries, who, at that time, among others, served for pay, asked leave of the Governour of the place, that he might doe his best to help his Fellow-soldiers, who consenting, he took immediately from every sick Man, at the first coming of the Disease, before any Swelling appeared, a great quantity of blood, till their feet began to fail them, for he bled them standing, and in the open Air, nor had he any Porringers to measure the blood in; this being done, he sent them to lie down in their huts, and although, after bleeding, he used no remedy at all, yet, of abundance, whom he treated in this manner (which is a wonderfull thing) there died not one Man.

But although I am not onely sensible of the benefit of this practice in my judgment, but have long since found it so indeed by experience, yet the dissipation of the Pestilential ferment, by transpiration, pleases me, upon several accounts, better than Evacuation by Bleeding, because it does not so much weaken Patients, nor expose Physicians to the danger of Infamy. But this also does not want its difficulties; for, first of all, Sweats are difficultly procured in several people, especially in young Men of a hot constitution: Which sort of Patients, the more you endeavour to raise a Sweat by strong Hydroticks, and heaping on much clothes on them, the more danger you bring them into of a Phrenzy; or, which is of a sadder portent, being held so long in expectation, at last, instead of Sweat, you will produce the Tokens. For seeing the principal fault in this Disease consists in the more spirituous part of the mass of blood, wherefore the exagitation of the more gross particles, is for the most part more languid, than in other inflammations; and this thinner portion being put in a greater rage, by the accession of new heat, does, at length, by its assault, wholly break all the fibres of the blood, distended beyond the measure of their texture; from which dissolution of the fibres of the blood, I think the cause of the Tokens may be fetched: For just as the Marks that are inflicted upon some muscular part of the body, by a violent blow, so they at first appear very red in the Skin, and in a short time after appear black and blew. But then in bodies that are apt to Sweat, if the Sweat be broke off sooner than it should (that is, before all the morbid matter be dissipated) the condition of the Buloes, which indeed began to come out well enough, towards the latter end of the Sweat, becomes worse afterwards; for part of the matter being subtracted, which ought to raise them, they either easily strike in again, or they never come to legitimate abscesses (as it usually happens in the Small Pox, whenever the Patient has Sweat violently in the first days) and then, at length, the cruel enemy being received within the walls, a commotion is raised in the blood, by means whereof oftentimes Spots, the Tokens of imminent death, are forced out.

And I continued this custome of bleeding freely to which also the use of Ptisane (and such cooling Diet) was added in many Patients, with wonderfull success, till at length, failing of the wonted success, in managing of some, out of the wilfulness of some By-standers,

By-standers, who were possessed with vain Prejudices, and would not suffer a due quantity of Blood to be let, to the Patient's great damage, from whom (at least while the scope of Cure turned on this hinge) either Blood was not taken in a sufficient quantity or not at all; I perceived a great stop put to my endeavours, and therefore I reckoned another way of opposing this Disease than Blood-letting, if it could be found, would be of great use.

First, if the Swelling did not yet appear, I bled moderately according to the Patients strength and constitution, which when done, sweat, the raising whereof otherwise had not onely great difficulty in some bodies, but also danger of greater burning and of the purple Spots was threatned, became easie and expedite. And the benefit of the Sweat that did immediately follow did abundantly compensate the loss of blood, which otherwise, how small soever it were, had brought a most grievous inconvenience. After bleeding (which I ordered in bed, when all things were ready to cause a Sweat) without the interposition of the least delay I presently covered the Patient with clothes, and bound a woollen rag to his Forehead; which covering of his Forehead conduces more towards the raising a Sweat, than one would easily imagine. Then, if there be no Vomiting, I give these and the like Hydroticks; Take of *Theriaca Andromachi* half a drachm, *Electuarii de ovo* 1 scruple, *Gascoin's Powder* 12 grains, *Cochinelle* 8 grains, *Saffron* 4 grains, with a sufficient quantity of Juice of *Kermes* make a *Bolus*, which let him take every sixth hour, drinking upon it 6 spoonfulls of the following Julep; Take of Water of *Carduus Benedictus* and *Scordii compositæ* each 3 ounces, Treacle-water 2 ounces, Syrup of Clove-gilliflowers 1 ounce. Mix them.

But if a Vomit interrupted, as it often happens in the Plague and pestilential Fevers, I deferred the giving a sweating Medicine so long, till the Sweat began to run onely with the weight of the clothes (except that now and then his face was covered with the Sheet to gather the Vapors:) For, which indeed is very well worth the observation, when the rays of the morbidick matter extend themselves towards the outside of the body, immediately the Looseness and Vomiting that proceeded from them tending inwards, and falling upon the Stomach and Guts, cease of themselves, so that how great soever a subversion of the Stomach precede, the Medicines that are taken afterwards may well enough be kept, and conduce to the raising a Sweat according to desire. I ordered the Sweat, when it was begun, to be continued for the space of a natural day, by drinking now and then a draught of Sage posset-drink, or of Mace-ale, strictly forbidding him to wipe all that time, no, nor so much as to change his Shirt within 24 hours, till the Sweat was ended, how wet and foul soever it were; A thing which I would have observed with the greatest care. But if Sweat be circumscribed in a narrower limit of time, the Symptoms immediately grow as fierce as ever, and the Patient's safety, which a longer Sweat had put out of all danger, is in extreme hazard. And, truly, I cannot sufficiently admire, why *Diemerbroeke* and others are persuaded on so slight a pretence to break off Sweat, as forsooth to provide for the Patient's strength; for there is no man that hath been the least conversant in the Cure of this Disease who observes not, that as soon as the Patient is all in a Sweat, he finds himself stronger than before. What my practice and experience hath taught me in this matter I will not be afraid publickly to maintain. Many, through my advice, when they have been thrown in a Sweat for 24 hours, have been so far from complaining that they found themselves weak after it, that they rather professed, that as much supervacaneous humour as they had lost, so much new strength they had acquired. And about the latter

hours I observed, not without admiration, a certain Sweat burst out, more natural, kindly and copious than the first, which the strength of Medicine had forced out, and which gave much more relief, as if it had been plainly critical and eradivative of the whole Disease. Moreover, in the very height of the Sweat, I do not see what inconvenience it brings along with it, to refresh the Patient with Broths and comfortable Spoon-meats; and therefore the objection concerning want of strength to bear long sweating falls to the ground. And we may see (which shews the benefit of this practice) that as long as the Patient runs with Sweat, he apprehends himself well, and all that are by think him in a good condition: But as soon as the body begins to grow dry, and the Sweat is broke off, all things grow worse, the Disease as it were returning afresh.

For 24 hours after the Sweat is ended, I order him carefully to avoid the Cold; to let his Shirt dry of it self; to drink all his drink warm; and to continue the use of Sage posset-drink. The next morning I give him a Purge: And by this method of Cure I recovered very many of pestilential Fevers; so that not one died of that Disease, after I began to practise this method.

But when a Swelling was risen, I hitherto would not suffer a Vein to be breathed, in a body never so indisposed to Sweat, fearing lest the morbidick matter returning into the emptied vessels, the sudden death of the Patient should prevent the designed Sweat. Nevertheless perhaps blood might be let safely enough, if immediately as soon as it were let, without any stay interjected, Sweat were raised, which produced to the foresaid time requisite, might consume and dissipate the Swelling; and that with much less danger of health, than if a legitimate ripening of the Imposthume, which in a hazardous case is very uncertain and fallacious, were longer expected.

Sydenham

XLVIII. I was never concerned for watching, although it continued for the three first days. The Headach abates the first day, is tolerable the second, the third is removed onely by the use of Sudorifics. *Opium* has a Sudorific quality, it in a great measure makes up Treacle, *Dioscordium*, Mithridate, &c. which in my opinion would want a Sudorific faculty, if they wanted *Opium*: Yea, it is reckoned by Authours among Alexipharmacks themselves, whose use is singular in every malignant Fever. And certainly, I believe, there is not one Medicine to be found, that is able to give the Patient ease so quickly as *Opium*, and concerning whose operation more certain things may be predicted; whoever use it frequently and circumspectly, than of *Opium*. Nevertheless at this time I used it sparingly, contrary to custome, because Sleep is very much suspected for the 2 or 3 first days. But when Watching had held a man 6 or 7 days, with a decay of strength, the Medicine following did much good, giving a spoonfull of it every quarter of an hour; till the Patient fall asleep. Sleep is produced by it and plentiful Sweat. Take of our Prophylactick water 1 ounce and an half, Borage water 1 ounce, Cinnamon water 3 drachms, *Confectio Hyacinthi* 1 drachm, *Sacchari perlati* 4 drachms, *Laudanum opiatum* 2 grains. Mix them. Therefore you may use *Opium* the foresaid way. Nor is there any reason here why you should be too bold in using it in cacoymick persons, those that are weak and have a foul Stomach, or that you should be too timorous, and content to use it in no case; for by this means you most evidently declare, that its virtues are unknown to you. Before I come to *Laudanum opiatum*, I endeavour to remove the Headach by the following means. Let Ground-Ivy bruised be applied to the Head, also Plantain. Let this or something like it be applied to the Soles of the Feet and the Palms of the hands. Take of leaves of Rue 1 handfull and an half, Sowre Leyen 2 ounces, Pi-

geon's dung 1 ounce, common Salt half an ounce, Elder-vinegar what sufficeth. Mix them. Make a Cataplasin; Or, Take of Bole-armenick, *Terra sigillata*, common white Chalk, each 1 ounce and an half; Marigold-vinegar what is sufficient. Mix them. Apply it as before. Sometimes also I applied Powder of Cloves wet with Spirit of Wine; for, I think, Vinegar does harm.

Barbette.

XLIX. A Loosness in the Plague is often a forerunner of instant death. Yet I have often known when neither blood nor bloody matter has been voided, that the things following have done good. Let the Patient and the Physician abstain from all acid and salt things, of much use otherwise in the Plague: As also from plentiful drinking; but if he cannot bear his intolerable thirst; let the Patient take 2 or 3 spoonfulls of this Mixture. Take of the root of Tormentil 1 ounce, red Rose flowers 1 pugil, shavings of Hartshorn half a drachm, seeds of Sorrel, Myrtle, each 1 ounce; Boil them in Steel-water. To 9 ounces of the colature add of *Confectio Hyacinthi* 1 drachm, Syrup of Myrtle 1 ounce. Mix them. Treacle alone has done good to many, if a small piece of it has been taken once an hour till a drachm has been taken. Binding Clysters, drying also and emollient ones are here very necessary; yea, they should be given twice or thrice every day. Lees of White-wine or rather of Red-wine, applied hot to the Navel have done much good.

Idem.

Sylvius his method of Curing the Plague.

L. Like as upon examination of all the Symptoms that usually accompany the Plague, and upon consideration of the Remedies, that serve for prevention of it, we have concluded that in most the nature of the deadly poison consists in a volatile and sharp Salt, so we think the same will be confirmed from its Cure. But that a methodical and rational Cure may be insisted on in the Plague, not onely the Functions must be considered which are primarily and chiefly hurt, but the parts also as well containing as contained, which are affected above others. The Functions are they especially that are called Vital, and among them, those that respect the alteration of the Blood in the Heart; and on which life does proximately depend. Among things contained, either the whole Blood, or some things concurring to produce the mass of blood, or both are disaffected in the Plague. Among the parts containing, and the solid, we observe both the conglobated Glands to be seized and corrupted by Buboës, and the external skin with the parts adjoining by Carbuncles and Spots. It is manifest, the Blood it self is very much changed in the Plague, when we affirmed, that it oftentimes loses its consistency, and is more fluid than ordinary. And because we believe that all consistency comes to the Blood from an acid Juice, we deservedly conclude that the Acid, mixt, or to be mixt with the Blood, does most suffer and is corrupted in the Plague. Since moreover we have shewn that an Acid can so powerfully be broken and therefore corrupted, by nothing, as by a Lixivious Salt, I think we have deservedly derived the Pestilential poison from it. Again, when we weighed its quick operation and extreme violence in Reason's balance, we concluded this lixivious Salt was volatile and very sharp. And seeing among all the Humours hitherto observed in our Bodies, onely Bile is found to partake of a volatile Salt, we plainly think that we judged according to reason, that it is often vitiated by the pestilential poison, and is rendred more sharp and volatile than usual; So that the pestilential poison joins it self to the Bile, as to an humour most homogeneous with it, and spoils it; But that it exerts its violence upon the Acid, as upon a thing opposit and heterogeneous, and breaks and corrupts it. The pestilential poison, I say, because at least as

far as most Physicians determine, is not bred in Man's body, but comes to it from abroad, and then is afterwards communicated to others by Contagion: Therefore the Indications to be observed in the Cure of the Plague must be taken, 1. From the Poison it self admitted from abroad into the Body, and infecting the Bile, both corrupting and infringing the acid Juice, and colliquating the Blood it self, and destroying the solid parts, by Buboës, Carbuncles and Spots. 2. From the Bile it self degenerating from its pristine integrity, and putting on the nature of a pestilential poison. 3. From the acid Juice in our Body, broken and corrupted. 4. From the Blood it self melted, and destitute of its consistence. 5. From the conglobated Glands producing Buboës. 6. From any parts seized and corrupted with the virulence of the Carbuncles. 7. From the whole *Superficies* of the Body defaced and sometimes corrupted with many Spots and Tokens.

First of all, the pestilential Poison it self, as it is admitted into Man's body beside the Laws of Nature, so it indicates its reciprocal expulsion out of it. The same, as it infects all it meets with in the body, and changes it from a laudable state into a noxious, it indicates its alteration and correction. Secondly, Bile, as it is made more volatile and sharp by the pestilential Poison, does indicate its fixation and contemperation. Thirdly, the acid Juice of the Body, as its acid Acrimony is broken and corrupted by the pestilential Poison, indicates the reparation and restitution of the same Acidity. Fourthly, the Blood, as it hath lost its consistence by the pestilential Poison, indicates the recovery of the same. The fifth, sixth and seventh Indications of Buboës, Carbuncles and Spots, we shall treat of peculiarly and severally. Now we will propound the *Indicata* of the foresaid Indications.

1. The pestilential Poison, seeing it frequently penetrates the inner parts by the Pores of the Skin, it may most commodiously be expelled by the same, and therefore by Sudorifics. The same, because sometimes perhaps it is inspired in with the Air, and doth then also alter and corrupt the Spittle, which being continually swallowed down causes loathing in the Stomach, it may not inconveniently then be driven again, at least in part, out of the body: And when part is carried off by Vomit, the rest that passes with the Air to the Lungs, and by and by to the Blood, may most conveniently be thrown off by Sweat with those foresaid Diaphoreticks. The same Poison, as it is noxious in its quality, vitiates and changes for the worse whatever it meets with in the body, and that indeed by its salt, volatile and sharp quality, it may be corrected by a powerfull fixing Medicine, and one that takes off the acrimony. And because nothing has such a fixing and assuaging virtue as Sulphur, but fixt, therefore such a virtue may well be expected from every such like Sulphur, that is, either fixed or fixing, suppose it either metallick or mineral. 2. The Bile, that is rendred too sharp and volatile by the pestilential Poison, will be fixed and tempered with the same Medicines with which the former was. 3. The acid Juice broken and corrupted by the pestilential Poison, will be repaired by the use of Acids, such as are convenient for every one's particular constitution. 4. The Blood will recover its consistency by the taking of Acids, not much at once, but at several times, and always in a small quantity. But since there are so many Indications in the Cure of the Plague, it will be the prudent Physician's part to select and make use of such matter for Remedies, as may answer most Intentions, that he may kill several Birds with one Stone, and that those that are infected with the Plague may be cured with Medicines not at all compounded.

Sylvius de le Boë.

LI. If one will compare all things we have taught, concerning the matter of the *Indicata* in the Cure of the Plague, he may without much difficulty observe, that the primary Cure of the Plague may be performed with a very few Medicines, simple enough, that is, with Vomits, but Antimonial ones especially: with several sorts of Sudorifics, and they in like manner Antimonial ones: with things that fix Salt and Bile which are too volatile, among which Antimonials are not the last: with things that repair the Acid, deficient both in the blood and elsewhere, which are not wanting in Antimony, so that of one, and it may be of Antimony alone, Medicines may be prepared which may satisfy all Indications in the Plague. Volatile, oleous Salts will be good to provoke Sweat, and to drive out the pestilential Poison, and to temper the over sharp Salt and Bile. Acids, and especially Spirit of Nitre will serve to correct Salt and Bile offending in too much volatility and acrimony, as also to restore a consistency to the Blood, and to repair the Acid that is made dull in the Body. So that any one seems to have need but of three Medicines at most, happily to perform the internal Cure of the Plague; and, 1. Vomits, when they are proper. 2. Sudorifics, but consisting especially of Volatile, Oleous Salts, because they also temper the acrimony of the poison. 3. Acids, among which Spirit of Nitre should be preferred, because it is endued likewise with a fixing quality; but most of them must be diluted with convenient aqueous things, that they do no harm.

Idem.

LII. Nay sometimes Vomits and Sweats may be joined together, and Sweats and Acids, or at least in the middle of a Sweat some sub-acid mixture may be given by Spoonfulls, I say, sometimes Vomits may be joined with Sweats; for it does no harm to take them together, and to have them work together, since they are not motions contrary one to the other, but different, by Vomit and Sweat. (See Book 19. of Vomits.) Therefore in the Cure of the Plague, when Loathing is urgent, and Strength is good, a Vomit may safely be given in the beginning, made of Antimony, but which may also have the faculty to move Sweat, that is, that which they call *Antimonium diaphoreticum*, but not too much fixt, or something better, if any man have such a thing, or some other Sudorifick may be joined with any other antimonial Vomit, either made of the same Antimony or prepared of the same matter.

Idem.

LIII. It is not difficult to understand from the rules of Physicians, that a method must be observed in the Cure of a pestilential Fever, different from what they have laid down in other Fevers; As we may gather from the drying Meats, from the astringent things, from the gross Diet, and the larger indulgence as to Meat and Drink; All which things we carefully prohibit in all other Fevers, whence *Celsus* thought good to cause thirst in this Fever.

Brutus, de
Vitu Febr.

LIV. It sometimes happens, that Swellings break out, when neither a Fever, nor any other grievous Symptom has gone before: although I am suspicious that some shivering or shaking has ever gone before, but not so perceptible. But they to whom this happens, it is safe for them to walk abroad in the Streets, and to go about their business, as healthy people do, neglecting all care of Regimen.

Wine has been wholesome. IV.

The Spots are an imperfect Crisis. V.

I. BE gone ye *Hemophoboi*, who, as soon as ye see Spots in the Skin, superstitiously abhor Blood-letting. For to pass by, that Nature, when she is eased of part of her burthen, does rise with greater courage against the reliques of the matter, it is most certain, that these cutaneous efflorescences are symptomatick, and the unloadings or things cast over-board by the exsultating blood, which therefore requires Phlebotomy. But grant they were critical, yet without doubt the *Crisis* would be but half, and as it were a dimidiated abscess, unequal to the Disease, which it is meet to help, going Nature's way, carrying what should be carried by proper ways, what way they have an inclination. But the motion of the Spots, and opening a Vein is the same, from the centre to the circumference, from the inner parts of the body to its superficies; so far are the Juices that are drawn to the Skin, from retreating or altering their course upon breathing a Vein. For when the Veins of the Limbs are emptied, does not the Blood by a certain continuity flow out of the greater and inner Veins thither, to fill the empty place. Who therefore dare deny, that the Blood is carried by Phlebotomy not from without inwards, but from within outwards? Wherefore even in internal Inflammations, also in Grief and sudden Fear a Vein must immediately be opened, to disperse the Blood and Spirits, gathered in the Bowels. And although after Bleeding Sleep sometimes oppresses a Man, because of the dissipated Spirits, which Nature would rally, yet it is justly forbid, lest the Remedy be frustrated of its end, namely, the Diffusion of the Blood from the inner to the out parts.

Menotius
de Febr. ma-
ligna.

II. Evacuation by stool is no way agreeable with Spots in a Burning fever, although sometimes it does good. I have seen indeed some of them that have been in that condition freed by a Loosness, yet they are much better and safer freed by Sweat, because the malignant Juices are averted from the Bowels. But I have far oftner seen Purging by Art do such good, than a spontaneous Loosness: nor undeservedly: because in the former Nature endeavours outwards; but for the Juices to go inwards spontaneously is a sign of great weakness, but to be drawn by Medicine, not so: for what is caused by an external cause, should not be imputed to the Disease: Therefore it has done many good to purge in the beginning, and so to have a care through the whole course of the Disease, that the body be not costive, because we can no way better prevent the Symptoms whereby all such people are commonly in danger. Yet I have learned both, for the aforesaid reason, and by sufficient experience, that it is very dangerous for this Disease to be judged by a spontaneous Loosness. ¶ You must not purge by stool unless there appear to be a great quantity of Juices, the discussion whereof you cannot expect by the Skin.

Vallésius.

Idem.

III. Vomits in Malignant fevers with Spots are generally useless, unless perhaps you perceive much humours to be contained in the Stomach; for then it is lawfull to cast up by Vomit what is there contained, especially if the sick Party be easie to vomit, otherwise no Man must be forced to vomit, lest the motion of the humour, that is otherwise vitious, be recalled inwards. For the mouth of the sto-

F f 2

mach

Vallesius.

mach is of too sharp a sense, and too near the Heart and the Head, for the malignant juices to be gathered thither. ¶ In the Year 1659. I had under my cure a Maid 36 years old of a most cholerick complexion: In a violent Fever she had abundance of Purple, red and blew Spots arose. She had not the Small-pox, which were then Epidemick: At the very moment the Spots broke out, an exceeding anxiety came upon her, the cause whereof she could not express: I, suspecting that Bile did vellicate the mouth of the Stomach, to the vomiting whereof she was accustomed, give her warm water, a little while after she had drunk it, there followed a plentiful vomiting of a eruginous Bile, and the Spots presently vanished; and the Small-pox came in their room, whereof she did very well.

Bartholinus.

IV. Galen 1. ad Glaucon. c. 14. condemns Wine in Fevers, especially Burning ones, with a Delirium. When the Spotted fever, anno 1659. was Epidemick in our City, N. was come to that pass, as that there was no hope of his Life. But when he understood that he must dye, he sent a Messenger to the Bishop to entreat a Glass of Wine of him, for he expected the fatal hour, which was presently granted him in a larger measure than he expected. After a draught of Rhenish Wine, he fell in a sweat and a sleep, and the Fever was judged to health, although he relapsed sometimes because of his error in diet, yet without harm. ¶ Helmont de Feb. cap. 12. Sect. 7. contends violently with strong reason for Wine, so as to allow it in the Plague. ¶ Cesar Crivellatus, as he confesses, cap. 22. de usu vini in acutis, recovered of a Spotted fever by using Wine against the Physician's mind. ¶ In the Year 1676. a Malignant fever was Epidemick at Borgo di Sessa of which more died than escaped, live worms came out at all their Mouths. A Physician, who would try what would soonest kill them, sprinkled some with Oil, others with juice of Citron and Vinegar, and yet they were not killed: At length, when he had sprinkled Wine on them they quickly died: Hereby being emboldened, he gave his Patients Wine without scruple, which afterwards was the most gratefull Alexiterick of that Fever, whereby almost all escaped safe.

Augenius.

V. I never to this day have observed, that Nature perfectly judged this Fever by making an expulsion of these Spots to the Skin, which is consonant to reason: For if the Mine of this Putrefaction be kept in the mass of blood, how can it be that the Fever should be judged by these cutaneous spots? This is certain, That Nature does not evacuate well when it evacuates a little. And these Spots are very small in comparison to the corrupt and poisonous humour. Then the matter that causes the Spots, is too thin to be the Basis of the putrefaction, and certainly utterly insufficient for the extirpation of it. But all the hope of safety in this Disease must be placed in letting blood at the very first; and afterwards in purging and sweating, and sometimes in purging by Urine.

Febris Pleuritica, Peripneumonica, or, A Pleuritical and Peripneumonical Fever.

Its Description and Cure.

WHEN in the Year 1675. the season continued extreme, like Summer, till the latter end of October, and a cold and moist season followed that, there were abundance of Coughs abroad, which prepared the way for a Fever, and most readily

turned into one. In the mean time, as the Cough helped the Constitution in producing the Fever, so also the Fever, taking occasion from the Cough, did just invade the Pleura and Lungs, as it had invaded the Head the Week before these Coughs began. Which sudden change of the Symptoms gave nevertheless some men occasion (who took not so good notice) to take this Fever for an Essential Pleurisie, or for an Essential Peripneumony, although it remained the same, as it had ever been through the whole Constitution. And how much soever a pricking pain in the side, difficulty of breathing, the colour of the Blood that was taken away, &c. did intimate that there was an Essential Pleurisie, yet this Disease required no other Method of Cure, than what suited to the Fever of this Constitution, but it was very much abhorrent from that which was proper for a true Pleurisie. Besides, a Pleurisie, when it is the primary Disease, for the most part, invades at that time of the year which is between Spring and Summer, and as it were joins them both. This Disease being born under another Constellation, must be reckoned onely a Symptom of the Fever, that was proper to that Year, and the product of an accidental Cough.

That we may rightly proceed to that Method, which Experience told us was owing to the Coughs of that Year; we must observe, that those Effluvia, which were wont to be sent out of the mass of blood by insensible transpiration, were turned inward by the Cold contracting the Pores of the Skin, and fell upon the Lungs, by irritating of which, they after raise a Cough. And seeing by this means the hot and recrementitious Exhalations of the Blood are detained, that they cannot pass the Pores of the Skin, a Fever is easily kindled in the mass of blood, where, that is, there is either so great store of Exhalations, that the Lungs are not sufficient to cast them off, or by some adventitious heat, either of Medicines or Regiment, that are hotter than they should be, the fire is augmented, as if Oil were thrown into it, and he that was already inclinable enough to a Fever, is thrown headlong into one. Leaning on this foundation, if the Cough had not brought the Fever, and those other Symptoms, which we told you for the most part joined themselves with it, I thought it sufficient to keep my Patient from flesh, and all manner of strong Liqueurs: I advised him to use moderate Exercise, and to take the open Air: He drank now and then some cooling pectoral Ptilan. These little things were sufficient both to conquer the Cough and the Fever, and to prevent other Symptoms. For as by abstaining from flesh, and spirituous Liqueurs, and also by the use of cooling things, the blood was so contempered, as to be less apt for a febrile Impression; so also by the help of Exercise the hot Effluvia of the Blood, which, when the Pores of the Body were stoppt by sudden Cold, being driven inwards; raised a Cough, did more opportunely exhale, and were dispersed, to the Patient's great benefit. As for stopping of the Cough, danger was not wanting in attempting it by Narcoticks and Anodynes. Nor was there less danger, if one attempted the same by spirituous Liqueurs and hot Medicines, because when the matter of the Cough was inviscated and hardened both these ways, those Exhalations, which leaving the Blood quietly and insensibly, by Coughing vanished into Air, now when a passage was denied them, being shut up in the mass of blood, caused a Fever there. And this oftentimes succeeded very ill with many, who, while they endeavoured to put a stop to the Cough by burnt Brandy, and other hot Liqueurs, did invite Pleuritic and Peripneumonick Affections. Nor were they in a less error, who would by provoking Sweat, exterminate the Cause of the Disease. For

though

though Sweat burſting out ſpontaneouſly, does often expell the morbiſick Cauſe above all other Remedies whatever, yet it is clear, that while we extort it, we inflame the blood, and may kill him whom we would cure.

The Fever and its worſt Symptoms were beſt oppoſed by bleeding in the Arm, and a Blister applied to the Neck (for a pain in the Head, Back and Limbs followed the Cough) and by giving a Clyſter every day. In the mean time I adviſed my Patient, every day to keep up from his Bed for ſome hours, to abſtain from fleſh, and to ſup ſome Ptisan or cooling, lenient Broth, &c. When two or three days were over, if the Pain in his ſide were not abated, but troubled him ſtill violently, I took away ſome blood a ſecond time, and I perſuaded him to continue yet the uſe of Clyſters.

While in this manner we allowed the Diſeaſe time, that the Blood might by degrees get off thoſe hot particles, that were fixt on the Pleura and Lungs, all the Symptoms uſed quietly to vaniſh. Whereas they that ſet upon the Diſeaſe in a hoſtile manner, making as it were War with a huge force of Remedies, either loſt their Patients; or at leaſt were forced to redeem their Life by bleeding, oftner repeated, than the nature of the Diſeaſe did require, or indeed did ſafely admit. For whereas in the true Pleuriſie repeated Venæſeſion does the whole buſineſs, and is alone ſufficient for cure (if ſo be, that over hot Medicines and a regiment which fight againſt it, do not hinder.) On the contrary in this Symptom it was ſufficient to open a Vein once, or at leaſt twice, if ſo be the Patient were allowed to riſe from his Bed, and uſe a cooling drink. But there was no neceſſity to take blood away oftner, unleſs where the ſaid Symptom was very much increaſed by the acceſſion of heat from without: Nor even in this caſe was it without danger altogether.

Sydenham.

Febres Puerperarum, or, Fevers of Women in Childbed.

The Contents.

The Deſcription and Cure of a Milk fever. I.

Of a Putrid fever. II.

Of a Symptomatiſick fever. III.

Whence we muſt take the beginning of the Fever, from the day of bringing to Bed, or of the coming of the Fever. IV.

I. **F**EVERS of lying-in Women are reckoned as it were of three ſorts, a Milky, a Putrid, and a Symptomatiſick fever. The Milk fever ariſes, becauſe when the Breasts are filled and much diſtended with Milk, the blood-veſſels are compreſſed ſo that they cannot eaſily tranſmit the blood that flows that way: Whereupon the blood being ſtopt in its Circuit, begins to be tumultuous in the whole maſs, and when the Spirits are inordinately moved, and wholly confuſed, it conceives an efferveſcence, and makes a ſimple *Synochus*: Or becauſe the matter of the Milk tranſverſes the blood, a great ſhare whereof is in the Maſs of blood, and having left the Womb, that Liguor is tranſlated to the Breasts: Which if it exceed the due ſtore of the nutritious juice, and ſo all of it cannot be aſſimilated, but moreover abounds with heterogeneous parts, it does as ſome extraneous thing, and not miſcible, create trouble to the blood, and a febrile efferveſcence of three days continuance is ſpent in throwing of it out. This Fever is wholly committed to Nature, and as long as the *Lochia* go

right, proceeds for the moſt part ſucceſſfully enough, without the help of Phyſick, for after the efferveſcence of the blood, which is finiſhed in three or four days, either plentiful ſweat, or free tranſpiration ends this affection. Yet in the mean time above admiſſion of Milk, we muſt obſerve that it is uſual for them that will not give ſuck, within two or three days after they are brought to Bed, to cover all their Paps with ſome aſtringent Plaſters, (as *Emplaſtrum de Minio*, &c.) for ſo the glandulous ſubſtance of the Paps is a little contracted, ſo that they do not ſo readily receive the milky humour, that way ſcurient. Yet this ſort of remedy muſt be cauſiouſly uſed, leſt if milk be wholly excluded or forced too violently out of the Breasts, as it reſtagnates ſuddenly into the blood, it cauſe a diſorder of the ſame, a forerunner of a Putrid or a Malignant fever.

II. It proves a very difficult taſk to Phyſicians, to cure the Putrid fevers, becauſe all manner of Phyſick is accounted by the Vulgar, not onely uſeleſs, but hurtfull for lying-in Women; wherefore Phyſicians are rarely called; but when there is no place left for Remedies, and all opportunity of doing good is over. But a twofold *Methodus Medendi* ought to be gone upon, (as in contagious Diſeaſes) a Prophylaſtick and a Therapeutick. Although this Fever, how Malignant ſoever it be, is never got by contagion, and thoſe that are by need not fear the taking of any poiſonous infection from without, yet all Child-bed Women have an inbred Mine of Virulence: Wherefore they have need of an exact Regiment, to the end that after their Delivery, the impurities of the blood and humours may be rightly purged without the danger of a Fever. Therefore theſe three things muſt be inculcated to Phyſicians. Firſt, that they preſcribe an exact courſe of Diet, namely to feed of Oat-meal Caudle, ſometimes of Beer, ſometimes of white Wine and Water mixt together, ſometimes of Panada, and other light things, for a Week at leaſt. Becauſe they are much emptied, they may ſup ſomething the oftner, but no ſolid or ſtrong food muſt be given them. For I diligently obſerved, that the over haſty eating of fleſh and dainty food has brought theſe Fevers: For lying-in Women ſhould be treated not onely, as grievouſly wounded men, but as having got a febrile indiſpoſition, from the diſturbed frame and temper of the blood: Becauſe the blood in them has long ſince been too much exalted, and being as it were touched with an impure Infection, upon the acceſſion of any ſulphureous ſewel, it quickly takes fire.

After Diet the ſecond care is, leſt the pores be cloſed, or the *Lochia* ſtopt by careleſly admitting the outward Cold: For upon a very ſmall occaſion, when the order of tranſpiration is altered, the blood which was before efferveſcent, is diſordered: And the Womb alſo at the approach of the Air contracts it ſelf and the mouths of the Veſſels, ſo that the *Lochia* are ſtopt from running; wherefore I would have Women kept at leaſt five days in Bed.

The third intention remains; that the flux of the *Lochia* may be continued by a gentle proritiation of the blood. The cure departs far from the method uſed in Putrid fevers. For in this we muſt not expect, that the blood touched with a febrile burning, ſhould cool gradually, and then that it ſhould conquer the aduſt recrements gathered in its maſs, and ſeparate them by *crifis*: But rather (as is done in a Malignant fever) aſſoon as the blood begins to be in an immoderate ferment, it is convenient that it be gently firred by Diaphoretick Medicines, and that its heterogeneous and impure mixture be caſt out. Wherefore among the vulgar (and that not amiſs) it is the cuſtome, preſently to give Sudorificks. By this means the Blood being eventilated its Efferveſcence is ſtopt, and the *Lochia*, that are apt to be ſtopt, by

by the agitation of the blood, are provoked to run. When therefore a Lying-in Woman is first taken with this Fever, we must forthwith doe our endeavour that the fewel may plentifully be subtracted from the burning blood, by a prescribed Diet, and forbidding of flesh and broth thereof. In the mean time all cold and styptick things must be equally avoided: for they fix and thicken the blood too much, and hinder its purging, which is very requisite, both by the *Lochia*, and by cutaneous transpiration. But rather, although the Fever be urgent, let moderate hot things be given, Decoctions, or distilled waters of Marigold flowers, leaves of Pennyroyal, Mugwort, roots of *Scorzonera*, and Bezoartick powders, Spirit of Hartshorn, fixed Salts of herbs, &c. If the *Lochia* be stopt, we must doe all our endeavour that their flux may be again promoted. If the Belly be bound, it must be loosed with an emollient Clyster. We must have a care of too violent provocation; for it is manifest that in Child-bed, as well as in a Malignant fever, by much going to stool the strength is spent, together with a fainting of the Spirits. If at any time, with a suppression of the *Lochia*, there be a disturbance in the blood, vomiting, thirst and watching, I have known *Laudanum* mixt with Saffron often given with good success. 2. If notwithstanding the use of these Remedies the Fever still grow worse, and be sensibly encreased with a worse apparatus of Symptoms, as if, besides Disorders in the Blood, the Brain and Nervous parts begin to be affected, Medicines, though many of several sorts be tried, are oftentimes able to doe but little good, yea in this case the Indications do co-incide with those that are to be used in the Plague it self: since the *Lochia* when they have been some time stopt, cannot easily, or scarce at all, be brought again in a great confusion of blood and humours. Therefore it is good to quicken the motion by Diaphoreticks, namely, that the corruption impressed on the blood and nervous juice, and reëmanating from the Womb, may in some measure be cast off by sweat and insensible transpiration. Wherefore here Bezoartick Powders and Confections, Spirit of Hartshorn or Soot, Tincture of Corals or Pearl, are good. I have seen sometimes a little hope appear, by the help of these Medicines, with the Pulse and other Symptoms growing better for a little while; yet the cure seldom succeeded: but when the use of these Cordials was left off, the Patients forthwith died with a weak Pulse, as soon as ever a Looseness came. 3. While the condition of the Patient does still grow worse, as when with the encrease of the Fever the Pulse is weak and unequal, and there are frequent shakings and convulsive Motions in the whole Body, with a *Delirium* and Stupidity, then the Physician, having first given the prognostick of Death, must insist on a few remedies, and those generally onely cordial; and let him abstain from Bleeding, Scarifying, Blisters and Cupping-glasses: for such administrations onely beget hatred and calumny, so that for that reason they are accounted as Executioners, and hard hearted, among the Women.

III. The acute Diseases of Lying in Women are sometimes attended with some notorious Symptom, that is, Quinsey, Pleurisy, Peripneumony, Dysentery, Small-pox, and the like, and then they carry the names of these affections: I judge that all these Symptoms proceed from a certain Coagulation of the blood, and from an Extravasation of it. But while the Blood is extravasated in one part, all its natural and critical Efflux is stopt in another, wherefore there is danger, lest while the blood, begins to be coagulated, either in a particular and usual focus of congelation, or universally in its whole mass, the running of the *Lochia* be forthwith stopt, which truly usually happens, and therefore these Diseases are usually mortal to Lying-in Women.

Among these the Quinsey, Pleurisy and Peripneumony, because of the Analogy of their Cause and Cure, may be considered together. When a Lying-in Woman is affected with any of these, at the very first we must endeavour, that the Blood, which is fixt any where, and begun to be extravasated, may be restored to circulation, and not cause an Imposthume, because Lying-in Women are very seldom, when they are taken with these Symptomatical Fevers, cured either by abscesses of the matter or spitting. Wherefore internal Remedies, which melt the blood, and free it from Coagulation, must be used, such as are especially Diaphoreticks, full of a volatile Salt, as Spirit of Hartshorn, Soot, Urine, and also the Salts themselves: also testaceous and bezoartick powders, *Lapis prunelle*, Decoctions and Juleps of Vegetables that provoke the *Menses* or Urine, among which things appropriate to the Womb may be mixt, not neglecting things externally discutient. In the mean time let the impetuous motion, and immoderate effervescence of the blood be put far away, and the recrements thereof be still carried downward by all means possible, frictions, &c. By bleeding, if the plethora be great in the whole, and the inflammation very acute in any part: And if necessity be urgent, in the Arme; after this, another bleeding in the Legs (if it can be admitted) may follow. But I must caution you, that you must be very careful how you practise bleeding in these cases, for unless it give ease (which I know seldom so happens) presently, the Pulse grows weak, and the Patient's condition grows worse. A Dysentery has its rise commonly from the like cause with the foresaid affections: But in this, because the extravasated blood is presently voided, nor being retained in the body does it create trouble there, and corrupt still more; and since this way of evacuation is near the uterine Flux, and does not derive it another way; Therefore less danger is feared in this Disease, than in the foresaid: Yet oftentimes this Disease is mortal to Lying-in Women, because by the dysentery things attemperating the blood, and moderately astringent are indicated, but these are observed too apt to stop the Flux of the *Lochia*. Wherefore in this case, till Lying-in Women are sufficiently cleansed, let the cure of the other Disease be omitted, let the violence of the Symptoms be restrained onely by assuaging things. The Indications of the Small-pox do not onely differ from the above said, but are accompanied with such as are contrary one to another: For the Flux of the *Lochia* requires to be stopt moderately; yet in the mean time so, as that the Efflorescence of the blood and a gentle Transpiration may be continued. For seeing in this Disease the poisonous ferment is twofold, and the corrupt particles of the blood are carried outward two ways, we must have a care that the less and fraiter part, do not draw to its Threshold, either all the matter, or more than it can let out. Therefore lest the *Lochia* running too freely should call in the Poison, that is apt to fly outwards, the Womens Diet must be a little altered, and things that are alexiterick and astringent (as root of Tormentil and Bistort) must be boiled in their Caudles. Also Powders, Juleps, and things that are endued with such a virtue, must be given at due Intervals. Moreover in this case the Women must by no means be allowed to eat flesh or the broth of it, or to rise from their Bed: But when rest both of Mind and Body is procured, and a Diet ordered of such things as do not exagitate the blood, the matter commonly may be wholly committed to God and Nature.

IV. It is much disputed, whence the beginning of these Fevers should be computed, that is, whether from their very delivery, or from the sense of a Fever. Nevertheless it makes not much matter, whether the controversy be decided this way or the other. For because this Fever does not equally

Willis.

bly run through the usual stages of Putrid fevers, nor will have a crisis, nor admit the use of a Purging Medicine at all, we have no reason to be at all solicitous, about its period, or the measuring it out into days.

Through neglect of Remedies the Disease grows worse, and death follows. XVII.

I. They are not to be hearkened to, who do not allow of Blood-letting in a Quartane-Ague, unless the redundance of it appears by the signs of turgid Veins, and other ways: for there is always, from the beginning, a Plethora ad vires, unless it follow other long Fevers. And Galen's rule is worthy of great commendation, *1 ad Glaucon*, where, if the blood, that is first taken away, appear black, and foul, he would have a greater quantity of it taken away; but if it be red and pure, he would have but a little taken away, and bleeding to be repeated no more. ¶ But although this rule sometime hold good, yet it is not always true; for as *Avicenna*, 1. 3. tract. 4. says, *Oftentimes the blood begins to run thin, but in the process of the evacuation it is thick and black*, because the blood that was without was good, and that within corrupt, and putrefaction lies hid in the inner parts.

II. A young Man being tired out with a Quartane-Ague, forced the Chirurgion to take more blood from him, than was convenient for the disease, or than he had strength to foregoe. By which rash sort of remedy, the Ague was so far from being abated, that it was rather much increased; and, by exhausting the fountain of life, it deprived the Body of its colour and comeliness, leaving the *Præcordia* puft up, his Legs swollen, his Stomach weak, and a continual loathing of Meat. And he always remained so weakly, that in the smallest Diseases he fell into most violent Symptoms continually. Therefore, whoever you are, do not rashly irritate a Quartane, which kills no Man: You cannot doe it scotfree, but you may easily make it worse.

III. Their opinion is to be laught at, who would have concoction tarried for, before blood be let, because at that time it is more fluid and thin: for it is better concocted and prepared, if its quantity be first diminished.

IV. A Purge in the beginning must not be strong, for we must deal gently with a Quartane-Ague, all the beginning of it: by reason the humour, that is the cause of it, because it is contumacious, and resists expulsion, unless it be abundantly prepared, is irritated by strong Purges, and being irritated, it grows more fierce, and instead of a single one, it becomes a double Quartane. Therefore Antimony, and such things, should not be used in the beginning. ¶ Yet we ought not always to fear Purging in the beginning of Quartans; for if they arise from some other disease not well purged, we should utterly purge out the evil by the root, as *Hippocrates 2. de morbis* advises. Otherwise, some proceed here with so much scruple, that they affirm, we should not Purge at all; because they have observed, that Purges doe not any good, yea, they often wear out the strength without remedy, by farther depauperating the Mass of blood, preferring such things as exalt and volatilize what is fixt, and cause a spirituousness in the Mass of blood, such as are Spirit of *Sal Ammoniack*, Flowers of *Sal Ammoniack*, with *secula Aronis*, Salt of Tartar, Volatile Spirit of Sea Salt, &c.

V. The major part of Physicians agree, in giving Vomits in the beginning of the Fit; because Nature at that time is most prone to that evacuation. And there is no question, but to give a Vomit in the beginning of a Fit, and to repeat it several times, when the Fits begin, makes the Disease milder and shorter. ¶ Vomits are used with great benefit, which are the proper remedies of a Quartane-Ague, especially in those natures, that discharge their Liver and Spleen into the Stomach, and cause Reaching and Vomiting in the beginning of the Fits. For this purpose, 1 drachm of *Asarum* mixt with Whitewine may be given, yet with this caution, that if at once taking it remove not the Ague, it be repeated once a week, preparation and purging being used between whiles. ¶ It is convenient to evacuate by Vomit, especially if the Patient be inclined to Vomit: for although the melancholick humour may seem rather to require to be Purged downwards than upwards, because it is thick and earthy; yet because Quartanaries, through the weakness of their concoction, and the length of the Disease, gather much crude humours, which must be carried off by Vomit, so the matter is subtracted from the Quartane, and also the melancholick humour often regurgitates from the Spleen into the Stomach, whence it may conveniently be evacuated. *Saxonia*, almost every Fit, gives a Vomit, with great benefit; and experience shews, that nothing is better than this remedy. And *Galen* used White Hellebore, first with Rhadish, then without. But the Moderns use their gentle Vomits, as *Oxymel*, with a decoction of Rhadish, &c. And if the Patients be strong, *Helleborismus Heurnii* may be used: It is an extract of White Hellebore made by decoction: But it must very seldom be used. Concerning the time of giving a Vomit, we must take *Avicenna's* advice, who prescribes a Vomit either before or after Meat. After Meat the Patient Vomits more easily, but with less benefit: But if he be inclinable to Vomit, it is better before Meat: So it draws better from the Veins, because the virtue of the emetick is not abated by mixture with the Meat: Therefore it will be the best way not to use Vomits for once, but oftner; and if it be given on an Intermission-day, one will Vomit more easily, and with less trouble after Meat: but on the Fit-day, because the humour is easily moved, and it is hurtfull to give Meat, it is better to give it fasting, according to *Trallianus* his advice: Wherefore the English doe ill, who, when they take Vomits in the Fit, swallow a great deal of drink, which is very hurtfull, as experience often shews, that the Fits are thereby made more grievous and long, and the Stomach is weakned. ¶ Seeing a dull and gross matter

matter is peccant in a Quartane, which greatly resists the commotion of Medicines, it must be evacuated at that time, when it is disturbed by Nature, and altered by putrefaction: which, since it is at the time of the Fit, it must also, at that time, be evacuated. Which experience also perswades, for I have cured several Quartanaries by giving them Hellebore: But we must have a strong subject to work upon, otherwise it would be a mischievous Medicine.

Per. Sallus
Diverius,

VI. Although Hippocrates de Affect. n. 17. approve of Purging in the Fit, yet his opinion, lib. 4. de morbis, should rather be followed; where he reprehends the old Physicians, for Purging on odd days: because the humour is moved on those days: Wherefore no wonder, if after the body is disturbed by the motion of the humour, a new trouble arising from the Physick, do put the Patient in certain hazard. Indeed, there is some danger in Purging, when the shaking coming on disturbs it begun; and there is a contrary motion of the humours in the Fit to that which the Physick makes, whence a great disturbance may arise in the Body. But if we prescribe it, not indeed when the paroxysm is instant, but five or six hours before, so that the evacuation may be finished before the Fit come, without doubt it will turn to the Patient's advantage; for that part of the humour, which would cause the Fit, is taken away, and Nature is eased of part of her burthen. And let gentle Catharticks be chosen, which do not disturb Nature. Thus the Physick will not produce a motion contrary to what Nature intends, because they are made at different times, and do not concur; for purgation is supposed to be finished before the coming of the Fit. Let us in this place hear the solid judgment of Fernelius, l. 3. c. 12. "On a quiet day Purging is safer; on a disturbed one, more expedite: for when the Disease gives less trouble, and the recollected spirits are stronger, the violence and operation of the Medicine may better be born: but upon what day the Disease is exasperated, and the disturbed matter is in motion, it is more readily carried off. And a little after; "In the intermission of Agues, a Medicine should be given so long a time before the Fit, as that the purgation may be complete before it: because in the Fit the matter turns not to the Belly, but often another way, and oftentimes the Purging is stopt by the violence of the Fit, yet it is better to give a Purge before than after the Fit, and the day before a Quartane, than the day after. Yet gentle Purgatives may be given an hour before the Fit, to check it, which make revulsion of the humours rather, by irritating Nature, than by Purging the humours. For this pilula de Sagapeno Camilli, commended by Quercetan, and by Stockerus in his Empirica, are famous, onely one of which is given in the beginning of a Fit, continuing it for some days, for they have a virtue of dissolving gross and tartareous humours, and not onely of Purging.

Portis.

VII. Because Melancholick persons usually abound with crudities, we must therefore first take care of the pituitous before the melancholick humour, which must be got out of the first ways, first by Vomit, then by Clyster, and last of all by a gentle Purge.

VIII. I judge, the cure of Quartans differs from the cure of other Agues in this, that in Quartans Medicines are requisite, which more effectually cut glutinous phlegm, and now and then diminish it; but carefully used, till the glutinousness of the phlegm, being by degrees overcome, obstructions may be opened: Besides which, according to the diversity of the other humours that offend, more or less, other Medicines must be prescribed, which are proper to correct them, and sometimes also to diminish them. Which method, if the Physicians prescribe, and the Patients follow, and if

they observe a good course of Diet, they find a happy cure of their Quartane within a few weeks. As it falls out on the contrary, when either the Physicians, out of an inveterate prejudice, or desire of contradiction, condemn what they are ignorant of, or are too wise to imitate; or the Patients being morose, and obstinate neglect their Prescription.

Sylvius de le
Boë.

IX. If there be any disease, which deceives a hasty Physician, it is a Quartane, which makes its Crisis not by Days, but almost by Months. The history should be remembered, which is cited by Borellus, cent. 4. obs. 33. Mr. N. says he, more than once, told me of the death of his Father, who perished by the too much bleeding and purging of his Physicians, while he was ill of a Quartane. This disease is exasperated by such remedies, and turns to a double or a treble Quartane, wherefore we should rather have recourse to Specificks.

X. Sennertus, lib. 2. de febr. c. 19. premising what should be premised, from Pedemontanus, commends singularly 2 drachms of the powder of Asarum in a Glass of Cretan Wine, drinking it warm one hour before the Fit, causing Sweat with clothes: which being over, he orders, to take Sage, Rue, Shepherds-purse each 1 pugil, to beat them with a little Vinegar, and tie them to the wrists, and keep them on 24 hours, upon which the Ague ceases. The Asarum thus taken, besides Sweat, causes Vomit, and towards the end of the Fit it also purges downwards.

XI. I give those that are ill of Quartans onely a decoction of Turneps for several days. I was told of this by the excellent Gainerius, who writes, how he cured an Abbat more successfully by Turneps, than by any other Medicines. Pare them and boil them, throw away the first water quickly, pour to them some new fair water, and boil them to pieces, squeeze out the juice carefully, and Sugar and fresh Butter without any Salt. If the Patient be subject to Wind, add some Cloves cut a little.

Crato, Conf.
256.

XII. Although there be remedies, which may stop the Fits, and so hide the Ague, that is, hinder Nature, from separating the pure from the impure, by the ebullition of the humours, in her allotted time, and so at length from conquering the Ague; yet they are dangerous, and usually cast the Patient into a worse disease, unless they also evacuate, or that Evacuators, as they ought, have been given before. ¶ Narcoticks indeed have an excellent virtue to stop the Fit; But unless the greater share of the morbid humour be first evacuated, and obstructions much abated, they may do mischief, because they retain the vitious humours in the body, and breed obstructions, and other more grievous diseases: Yet if they be given in a small quantity, and mixt with aperient and inciding things, they will doe the less harm. ¶ The last year Was very fruitful in Quartans: The remedies which oftneft gave help, were such as stop the Ague-fit; for when the indisposition of the blood is a little amended, by the alteration of the season of the year, if the habitual custome of the Fits be but broke a while, Nature recollects her self. And such an intention, though sometimes it may be answered, by giving Vomits a little before the Fit (for they often stop the febrile motion of the blood, by raising a motion contrary to it) yet this Indication (the stopping of the Fit) is far more certainly, yea and successfully, performed by the use of Medicines, which do not at all evacuate the bowels, but give either a fixation to the blood, or a præcipitation of the febrile matter for a time. Wherefore, those I had under cure, provision being made for the whole, giving sometimes a Vomit, sometimes a Purge, three hours before the Fit, I used to order the Patients to apply Plasters to the wrists, and to take some Febrifuge powder in generous Wine, and to Sweat gently in their Bed: It seldom so happened, but at the first or second time the Ague-fit was in this manner stopt, and then the same remedy being repeated, but the Disease went perfectly off. ¶ When

Riverius.

Willis de
febr. c. 6.

a tough

a tough Ague tires a Man out, many fly to Enchantments and Spells (or *Periapta*) which doe many good, and stop the Fit. Some of them, by an evident and Physical reason, by virtue of Medicines applied: Others onely by Opinion, to wit, when a firm Assent, and certain Hope do second Imagination. For the Spirits and innate Heat, the chief Instrument of the Soul, being excited and made brisker by the Soul, confirmed and strengthened by such an imagination, do stir up the natural force, languid and asleep before, which afterwards resists the Disease, which, if it be already in a great measure broken, as it is in the declension, it is easily conquered, and utterly taken off by the strength of Nature, who is the curer of all Diseases. But in the beginning and increase of the Disease, when the matter is much and contumacious, they may not be used: for though Nature be strong, she is unable to overcome the morbid cause. Such things therefore should not be neglected, when the Disease declines apace, and is already broken by other Medicines. The other sort is of them, which may doe good on a Physical account, that is, applied to the Wrists, whose virtue reaches the Heart, by means of the circulation of the blood (to the interruption of which, the original of Agues is assigned by many) and do stop the turbulence and fermentation of this and the febrile matter: namely, some corpuscles, or *effluvia*, do pass from them into the blood, which violently fix and bind its particles, or by melting and moving, do, as it were, precipitate: Either way the spontaneous effervescence of the blood is hindered, just as when cold water is poured into a boiling pot. ¶ But to these Enchantments, or *Periapta*, which Dr. Willis speaks of, I would object the authority of the learned and pious Sennertus, who, l. 5. p. 4. c. 10. seems to condemn all such things as Diabolical. His words are these: "The healing of the Wound, which is attributed to the *Unguentum Armariæ*, is, for the most part, Nature's work (which often cures, not onely slight Wounds, but most grievous ones:) Which is evident from hence, that there are so many several compositions of this Ointment, and some use onely a piece of Bacon instead of it, and nevertheless the wounds are cured. But if by using this Medicine any grievous wound be cured, which seems to be above the power of Nature, it is done by the power of the Devil, who, by some compact, either implicate or explicite, is drawn to cure the wound. Nor do they remove the suspicion of this matter, when they object, that all simples are natural; and that no Characters, Conjurations, or Incantments, are used, either in the composition or inunction: For the Devil does not onely hide his compact under them, but also under natural things, if at his command (as it is done in the first and explicite compact, in which others, who use the same, may unawares involve themselves) if natural things be turned to other uses, than what GOD created them for; And thus Diabolical and Magical Actions are wrapt up and obtruded as Magical ones. If therefore Sennertus allows not a natural thing with Incantment, Why should we follow Willis his Fancy, deluded by Enchantment, though he give a natural reason for it?

XIII. If the body be costive, I judge moistning Clysters of a decoction of Speedwell, and *Carduus Benedictus*, may very well be given: And I can truly say, that I cured a Great Man (when he despised all other remedies) onely by the use of Clysters; but this must be done in them, who in the beginning of the Fits have a griping in their Gluts.

XIV. I have heard from a famous Physician, that he was almost killed with a Quartane, and was cured by an Empirick in this manner; First of all he used Fomentations to the part affected in the beginning of the Fit, that in process of time he might carry off the matter: For it must be carefully ob-

served, what part of the body is ill at the coming of the Fit; and that must be carefully fomented. *Idem.*

XV. But I think it is better to mix Alteratives with Meat, than to give them alone, as the trivial Physicians of our times use to doe, who, unless they give Syrups, Apozemes, distilled Waters, Electuaries, and Purging Medicines, they think they doe nothing deserving a good Physician. And hence it is, that weak persons being glutted with the repetition of them, loath them, and that they are not aright reduced into act in the Stomach, which is the cause that they operate unhappily: Wherefore it is certain at that time, that they doe not onely no good, but much harm, seeing oftentimes, because of them, sickly and weak persons loath their food, and are thereby weakened. But they that follow Hippocrates, and acquiesce in his advice, 1 *Epid.* who says, *You must exercise your self in this, that at least, if you doe no good, you may doe no hurt*, will reckon it far better, not to give a thin diet, nor alterative Medicines alone; but to mix with things, that nourish and breed good chyme, such things as may by little and little amend the morbid intemperature of the parts. (You must understand these things of a Quartane, which follows other diseases.)

XVI. As for the cure of Quartans, There is no man, I suppose, that is but moderately conversant in this Art, who can be ignorant, how little all these methods answer expectation, which have hitherto been designed to take off this opprobrium from Physicians, if we except the Peruvian Bark, which yet oftner procures truce for the Disease, than conquers it: For when it has lain hid a fortnight or three weeks, to the great emolument of the Patient, who, having been ill handled by it, gets in the mean time a little breath, it comes afresh, and is as bad as ever; and, for the most part, let this Medicine be never so often repeated, the Disease is not conquered under a long tract of time. Nevertheless I will relate, what I have experienced, about the method of giving it. We must have a care above all things, that this Bark be not given too soon, that is, not before the Disease have spent it self a little (unless the decay of strength in the Patient requires it to be given sooner.) For there is not onely fear, that it may be rendered ineffectual by its too hasty use, but that the Patients life may be endangered, if we give a sudden check to the blood, as it is cleansing it self, with all its might, by fermentation. In the next place, part of the febrile matter must not be subtracted, neither by Purging, nor much less by Bleeding, to the end the Bark may doe its office more freely: for seeing, by either of these things, the oeconomy of the body is spoiled in some measure, the Fits will so much the sooner, and more surely return, as soon as the virtue of the Powder is spent. I think it more to the purpose, if we lightly tinge the blood with the said Medicine by degrees, and a long time after the Fits, than for us to try to kill the Fit, when it is just coming, all at once; for by this means, both more time is given to the Medicine, to doe its work in, and all the danger is avoided that may arise to the Patient, from the sudden and unreasonable check, whereby we endeavour to oppress the Fit, when it is growing strong, and exerting it self with all its might. Lastly, this Powder must be repeated at such short Intervals of time, as that the virtue of the first dose may not be spent, before another be given: For by this often repetition, an *æstus* (or good habit) will at length be recovered, and the Disease quite driven away. Being perswaded by these reasons, I prefer this method to all others; Let 1 ounce of Bark of Peru be mixt with 2 ounces of Conserve of Red Roses; and let the Patient take the quantity of a large Nutmeg morning and evening, every day, that is, without a true Fit, till he have taken the whole. Let it be repeated again three times, fourteen days always between.

XVII. The Reverend N. a sanguine Man, forty years old, after another Fever in Autumn, fell into a Quartane: of which, when about Spring-time, he was a little better, N. foretold him, when he was in a neutral state of health, that he would be grievously sick, but might recover, if he had a care of taking Physick. He trusting to this Prognostick, refused all help of Physick so long, till first an abundance of humours fell from his head, and parts thereabout, upon his left shoulder, which being neglected, with a slow defluxion interfect the left Muscles of the Belly, where an Inflammation arising, abundance of filthy Pus breed, and he died a little after. ¶ When the Disease is removed, the Patient must be carefully Purged: for it were incredible to tell, what a power of Diseases arise for want of Purging after Autumnal Fevers. And I wonder this is so little taken either care or notice of by Physicians. For whenever I observed a Man in years to be taken with an Ague, and that he neglected Purging, I could certainly foretell, he would afterwards be taken with some dangerous disease, though he little dreamed of it, as if he had been perfectly cured.

Wierus.

Sydenham,
Obs. p. 104.

her Stomach: Moreover, the region of her Stomach, and her left Hypochondrium was beset with an hard, renitent, and exceeding painfull swelling all over: besides the use of Clysters, there was no room for evacuation, because of the lowness of strength: Her Stomach loathed any the most gratefull Medicines. In this difficult case, which was circumscribed within narrow bounds of cure, I advised these few things, namely, twice a day to take two ounces of *Aqua magistralis lunbricorum*, with six drops of *Elixir proprietatis* in it. Moreover, I ordered a fomentation to be applied to her Stomach, of leaves of Pontick Wormwood, Centaury, Southernwood, with Roots of Gentian boiled in a Pot well covered: and after that a Toft of Bread, dipt in the same liquor, to be applied upon the region of the Stomach. Besides, I ordered febrifuge Plaisters to be applied to her Wrists. And by these remedies only she mist her Fit the third day, and remained free from it afterwards; and then in a short time she perfectly recovered by the use of chalybeate Medicines.

Willis, c. 6.
l. de feb.

II. The illustrious *Veslingius* and I several times visited *Andrew Argol*, the famous Mathematician, when he was very old, and lying ill of a kind of Quotidian ague (with long defillations, yet not customary to him; when the Spring was far come on) of which he recovered not so much by Medicines, as by abstinence, concoction of the humours, and strengthening of the innate heat being procured thereby: For he took nothing but *Alcetic Pills*, called *Aloephangini*, and *Cichory Broth*. A rare example in our times, but very conformable to the Prescriptions of the Ancients, with whom such Abstinence and observations of a *Diatritaios* were very usual.

Velschius,
Obs. 5.

III. In a Latick Ague we must have a care of Purges, or they must be very gentle, and given with great caution: for the humour that is the cause of the Ague, is disperfed through the whole to the minime parts, after the manner of the natural moisture, the coction and separation whereof Nature regards not; but, because of its mixtion in minime parts with the natural humidity, she keeps it: Wherefore I have not known such persons cured either by Purging or Bleeding. Nay, if the Belly be loose, either of it self, or with Physick, they grow worse, and the good being evacuated with the bad, before separation be made, they dye, wherefore we must proceed rather with a good course of Diet, than with Medicines.

IV. In a Phlegmatick Ague, which the *Arabians* call *Latick*, or *Latent*, much of the innate heat is spent, therefore we must give food that nourishes much. The Body is troubled with a moistning and laxative humidity, from a cold and moist humour, but because of putrefaction turned hot and dry. Wherefore the body is affected with this Fever, as if some part were put in boiling water, wherefore some have called this the *Ebullient Ague*. The proper food for such as are taken with this disease, must be actually cold and dry, but potentially moist. And this is, that it may dry up the moistning humidity, and that it may restore the body, deprived of the innate moisture, and harden the lax members. Now this is difficult to find in a Simple, wherefore you must thus make a Sorbition; Boil a Pheasant, or Partridge, or a Kid (for these are the best of Flesh) with Roots and Rinds of Citron, and leaves of Artichoaks; boil them to a Broth, make a Sorbition with Bread. The Artichok removes the moistning and laxative humidity, hardens a lax part, and that without the wasting of the innate moisture; Besides, it opens and provokes Urine, and penetrates deep, which is required to the cure of this Fever, because the humour is disperfed to the minime parts of the body. Whence any one may reasonably gather, that a thick and plentifull Urine, and Sweat, are two remedies of this Ague. Nor must it be omitted, that above all Humorary Fevers, this Quotidian Ague requires a Diet, that may strengthen

I. IN this Ague several intentions come under consideration; namely, we must endeavour all we can, that the Stomach may be discharged of the load of humours, the obstructions of the bowels opened, weaknesses strengthened, and, together with these things, that the dyscrasie of the blood may be amended, and the Ague-fits stop. Wherefore, because of such intentions as these we must go a long way to the Cure: Besides Vomits, Purges, Digestives, and Deobstruents, we must often give such things as restore the ferments of the blood and bowels, and correct their dyscrasies: Wherefore, fixt Salts of herbs, their extraets, acid mineral Spirits, and sometimes preparations of Steel, are very good. Concerning these means, there lies a different task, since, because of the manifold evil, many things must be done at once, yet because of the assiduity of the Ague-fit, the Patient has but time to use few of them. In these complicated distempers, though the form of method require us, first to remove impediments, and then to cure the Disease; yet I have known such an Ague in a cacochymick body, accompanied with several other illnesses, has been cured a methodically, and in an Empirical manner: That is, after a little provision for the whole, they first eased the Ague-fit, by applying febrifuges outwardly, that an opportunity might be taken of curing the rest better afterwards. I visited a Gentlewoman, who had long been of a cachectick habit of body, she was taken a month after her Lying-in, with a languid Quotidian-ague, after six or seven Fits, whereby she was brought so low, that she could not rise from her bed, nor take the least nourishment, but great trouble was created thereby to

Brudus de
vitiis febris
en. l. 3. c.
10.

Body much, after the manner of a Heſtick, to which it is very like.

Idem.

V. Nor muſt I paſs by in ſilence, that for them who are thus ſick, it is very good to boil Garlick, eſpecially for ſuch as are uſed to it, in their Meat and Broths: for it has a prerogative in ſtrengthening the natural faculties, and repairing the damages therein, which ariſe from the exceſs of two qualities, that is, cold and moiſture; moreover, it corrects the faults of the putrid humour, when it is diſperſed all the body over; it has alſo the faculty of driving from the centre to the circumference. Nevertheless, becauſe of its heat and acrimony, but little of it muſt be mixt with Broths, and it muſt be firſt ſteeped in Sorrel juice.

Idem.

VI. The proper drink for them is Whitewine, ſmall, deſecate and clear, of which take two parts, Pomegranate juice of a middle taſte, half of one part; Water, wherein freſh Maiden-hair has been boiled, one part. Mix them. But you muſt take care, that the Wine be very weak which you give them, otherwiſe it will doe them no ſmall harm.

Idem.

VII. We muſt take very great care that they be not looſe in their Bellies, but rather on the contrary, we muſt endeavour to make the Body coſtive, by things that open the pores of the Skin, and provoke Sweat.

Paulus Neu-
crantz de
Harrango.

VIII. *Trallianus*, lib. 12. cap. 17. in Quotidian Agues, when the Liver and mouth of the Stomach are cooled, and there is a Vomiting of Phlegm, approves of pickled things, and other hot things: for a cold and moiſt Stomach bears all extenuaters without harm. "I ventured, ſays he, once, to give a certain Man, who had every day a Fit of an Ague, and Vomited Phlegm, ſalt things, and the Fiſh pickled, which the Greeks call *ῥυζαῖοι*, alſo Brine, and Leek-pottage, and he grew wonderfull well. In which caſe, above all other ſalt meats, I ſhould give a pickled Herring, becauſe it is eaſie of concoction, and not grievous to a weak Stomach, and in goodneſs of juice, and gratefulneſs, comes behind none.

Febris Rheumatismi comes, or, A Fever attending a Rheumatism.

(See Rheumatismus, BOOK XV.)

The Description and Cure.

THIS Diſeaſe came moſt in Autumn, uſually upon this occaſion, ſcil. When the Patient had overheated himſelf by exerciſe, or any other way, and immediately took cold upon it. It begins the tragedy with a chilneſs and ſhaking, then immediately follow heat, reſtleſſneſs, thirſt, and all the other unhappy ſymptoms, which attend Fevers. After one or two days, (and ſometimes ſooner) the Patient is taken with a grievous pain in this or that Limb, eſpecially in the Wrists, Shoulders and Knees, which often ſhifts places, and takes them by turns, a little redneſs and ſwelling ſtill remaining in the part which it laſt ſeiſed. For a few of the firſt days, the Fever, and the recited Symptoms rarely concur: But the Fever inſenſibly vaniſhes, while the pain remains, yea, and is ſometimes more raging, becauſe the febrile matter is tranſlated to the limbs, which the Fever it ſelf ſufficiently argues, becauſe it often returns upon the repelling of the morbiſick matter, by unreaſonable application of externals. This Diſeaſe, when it is without a Fever, is often reckoned the Gout, though it be eſſentially diſtinguiſhed therefrom, as will eaſily appear to any Man, who perfectly knows both diſeaſes. If it be unſkilfully handled, it

often torments the wretched Man, not onely months; but ſeveral years, yea, all his life-time; though in this caſe it does not always ſeiſe him with the ſame vigour, but in certain paroxyſms periodically repeated, and now and then like the Gout. Yea, it may ſo happen, that when the ſaid pains have a long time grievouſly tormented a Man; they, at length, ceaſe of themſelves, and the Patient in the mean time may be deprived of all motion in his limbs till his dying day, the joints of his fingers being as it were turned in, and knotty protuberances, as in the Gout; ſhewing themſelves in the inſide rather than the outſide of the fingers, and nevertheleſs he may have a good ſtomach, and in all other reſpects be well in health.

There is alſo another ſort of this Diſeaſe, belonging to this place, which may very aptly be called a Rheumatick Lumbago, (of which BOOK X. iii. Lumbago.) becauſe both theſe ſorts of Diſeaſes ſeem to ariſe from Inflammation, which both the foreſaid *Phænomena* do argue, and eſpecially the colour of the blood, when it is ler, which is as like the blond of Pleuritick perſons, as an Egg is like an Egg; nor can any Man doubt, but theſe people labour of an Inflammation. The caſe ſtanding thus, I think the cure can be begun no other way but by bleeding, the blood in the mean time being tempered, and its exceſſive heat abated, as well by cooling and increaſſating Medicines, as by a convenient regimen.

And therefore I immediately order 10 ounces of blood to be taken from the Arm of the ſide affected, and I preſcribe a cooling, increaſſating Julep, to drink of it at pleaſure: For his pain, a Cataplaſm of the crum of Houſhold-bread and Milk tinged with Saffron, to be often renewed. But I forbid him Fleſh, and all broth of it. And I would have him riſe out of his Bed a few hours every day, becauſe the heat that comes from continual lying in bed, increaſes the Diſeaſe. The day following I take away as much blood, and two or three days after, according to the Patient's ſtrength, I take as much a third time, and then within four or five days (as the ſtrength, age, &c. of the Patient require) I bleed again the fourth, and uſually the laſt time: for it ſeldom happens, that we open a Vein above four times, except either a regiment, hotter than it ſhould be, have preceded, or hot Medicines have been given without any neceſſity. Nay, even Anodynes require plentifull blood-letting.

Wherefore, let the pain be never ſo cruel, through the whole courſe I religiously abſtain from Anodynes, becauſe by uſing them the Diſeaſe is fixt, and does not ſo eaſily give way to bleeding, which muſt for that very reaſon be the oftner celebrated, becauſe theſe Medicines have been too officiouſly given. And what if in the ſtate of the Diſeaſe they are not able to give that eaſe, which they pretend to? In the mean time, on thoſe days he does not bleed, I order a Clyſter now and then to be given him, and I earneſtly exhort them to take care, he have one given him every day, for eight days at leaſt, after his laſt bleeding; after which time I order him to take a gentle Purging Potion of Lenitives, and the evening following a pretty large doſe of *Syrupus de Meconio* in Cowſlip-flower-water, to the end the commotion of the blood, which might endanger a relapſe, may wholly be reſreſſed.

We muſt take notice, it is not ſo adviſable, when the Rheumatism has been ſettled for ſome years, to let blood at ſhort intervals, as at the beginning of it; but it is better to determine theſe repeated venaeſections at the diſtance of ſome weeks, which at length will either carry off the whole matter, or will doe it ſo far, as that by making an Iſſue in each Leg, and taking ſome of Dr. Goddard's drops in Canary-wine morning and evening, the remainders of it will be extirpated.

Febris Scarlatina, or, A Scarlet Fever.

Its Description and Cure.

ALthough a Scarlet Fever may come at any time, yet it usually comes towards the latter end of Summer, at which time indeed it takes whole Families, but Children especially. They are at first chill, and shake, as in other Fevers; but they that are taken with this, are not very sick; afterwards their Skin all over is beset with little red spots, much thicker and broader, and far redder, than in the Measles, but not so uniform. These Spots remain for two or three days, which at length vanishing, and the Cuticle underneath parting, there remains a branny Scurf, as if Meal had been strewn on the Body, which comes and goes off again twice or thrice.

Because this Disease seems to me nothing but a little effervescence of the blood, caused by the heat of the preceding Summer, or some such way, I do nothing at all to hinder the blood from despumating and discharging the peccant matter by the Pores of the Skin, which is ready at hand. Wherefore both on the one hand abstaining from Bleeding and Blisters (by which sort of Remedies, Revulsion being made, I suppose, the Particles annoying the Blood would be more intimately mixt with it, and the motion most congruous to Nature would be checkt) and on the other hand from giving of Cordials, by whose Heat perhaps the Blood would more impetuously be disturbed, than the gentle separation requires, which it is then wholly upon (and why may not a more violent Fever be kindled with this Tinder?) I reckon it sufficient, to keep the Patient wholly from Meat, and from all spirituous Liquours whatever; and that he neither go abroad nor lye always in bed. When the Skin is skaled off, and the Symptoms ceased, I reckon it good to purge the Patient with some gentle Purge, accommodate to his age and strength. By this simple and plainly natural method this name of a Disease (for it scarce amounts to more) is easily removed without trouble or any danger: Whereas on the contrary, if we trouble the Patients, by imprisoning them continually in bed, or by excessive giving of Cordials, or other unnecessary Medicines, over learnedly, and (as they say) *secundum artem*, the Disease is presently encreased, and the Patient oftentimes for no other reason, but his Physician's over-diligence, goes to the greater Number.

Febris Syncopalis, or, A Swooning Fever.

The Contents.

When it comes of Humours, Sometimes Blood may be let. I.

Whether a Vomit may be given? II.

Whether we may purge? III.

Its Nature and Cure. IV.

I. **A**Lthough Galen, 12. Meth. 3. be utterly against Bleeding, because it cannot be done without great loss of strength, being content onely with that evacuation, which is made by friction; Yet Trallianus, who is backed by Rhases and Averroes, advises Bleeding, that is, where the humour is half concocted, and abounds with store of blood. But if the humours be of another nature, if they be cold and crude, if the Winter, Constitution, Clime and Age be cold, and if the Blood be little and good, Bleeding would doe harm; be-

cause so the Patient is filled with crude and cold humours, according to Avicenna, 4. 1. c. 20. And this place of Galen's must be understood of extreme Crudity: for, in another, de S. M. c. 12. it appears, we may bleed, where the humours are not very crude. "Where, saith he, there is need of much evacuation, but the strength is low, in such we must part evacuation, as you saw me doe in them who had abundance of crude juices: for, when a little Blood is taken away, I presently give Melicrate well boiled, with some inciding Medicine, and so I let blood again, either the same day, or sometimes the next, then I give some of the aforesaid Medicines again, and take away a little blood again, and so again on the third day, as I did before". For as Fire is choaked with heaping up a great deal of green Wood upon it, unless part of it be removed, which when taken away, the Flame breaks out, so we must judge the same of our innate heat, which languishes with a mass of crudities, unless the superfluous load of humours be disburthened by means of Blood-letting.

II. Evacuation of the humour contained in the Stomach by Vomit may be attempted, but with gentle Medicines, according to Galen, 1. ad Glauco. 14. by giving fresh Oil of sweet Almonds to 8 ounces, to which, to make it stronger, I would add 2 ounces of Juice of Citron or Lemon: And to make him vomit the more easily, according to Galen, by heating the hands, feet, and the mouth of the stomach. Yet here Galen causes a doubt, who, l. c. in the beginning forbids evacuating Medicines, before the Stomach be strengthened. Again, afterwards he writes, that they who faint because of ill humours at the mouth of the Stomach, must be made to vomit with Water and Oil, and he makes no mention of strengthening the Stomach. I answer, that he supposes the fretting humours in the cavity of the Stomach, not fixt in the Coats. 2. When he writes, that the Stomach must first be strengthened before evacuation, we must understand it of some great evacuation which is made by Bleeding or Arong Physick, not by gentle things, and then he strengthens the Stomach inwardly and outwardly.

R. a Fonseca,
Conf. 20.
Tom. 2.

III. Galen in the Cure of this Fever abstains from all evacuation, and onely procures coction and attenuation of the humours, partly by revulsion with frictions, which also attenuate and evacuate, after which he anoints with Oil of Aniseeds, for dissolution: Nor does he attempt any sensible evacuation, unless sometimes by a Clyster, or giving crude Mulla and Oxytel with Hyssop, and he gives nothing else till the seventh day, because where there is crude phlegm, Fasting is easily born. Hippocrates confirms this Cure, who in anxious Fevers, where the Patient can get no rest, and the extreme parts are cold, gives nothing else but aqueous Oxytel, nor does he use any Sorbition till the declension. On the contrary, the Arabians, Trallianus and his Followers reprehend the aforesaid Cure, because Friction is but a slight and long Remedy: and the Patient cannot subsist with such a thin Diet to the end of the Disease. Wherefore they judge, it is better to evacuate the matter by little and little with gentle Medicines, not known in Galen's time. Besides, a little fuller Diet must be allowed of Juice of Ptisan, with Pepper and a little Honey: nor must Wine be forbid, to prevent and cure the Swooning. For a Decision we must say that Galen's Cure is safer, who does not evacuate but by Clyster, for by taking a Purge, though but a gentle one, the Patient may dye upon disturbing the humour, and so he may be guilty of his own death. And when Clysters are given, the Patient must not rise from his bed, lest a Swooning be caused, and they must be given in the declension of the Paroxysm, and must not be sharp. But if any thing must be given by the Mouth, it must not be by Physick, but by Mulla, Oxytel, and Ptisan mixt with Honey. Arculanus, a Man of great Learning

Learning and Experience, approves of this Cure, who says, that all his life time he saw onely four such cases: I. In an old Woman, who had a Purge given her, and she was cast into so violent a Swoon, that she was almost dead, and the fourth day she died. The other three were young People, one of which was troubled with a Loosness and frequent Swooning, with great Faintness, who yet was saved. Another sweat, and was cured thereby at length. In the fourth he onely proceeded with Clysters and Frictions, and afterwards, when the Swooning ceased, a Purge was given, and he escaped. Therefore, says *Arculanus*, as long as the Swooning lasts, we must proceed with Clysters, which when it wholly ceases, some gentle Purge must be given. ¶ In this Affair of the greatest moment we must go cautiously to work; for if the Swooning last the whole Fit, it is impossible to give a solutive Medicine, be it what it will; because affliction must not be added to the Stomach, that is perpetually afflicted, otherwise stomachical Swoonings become irrevocable and mortal, as *Galen*, §. de loc. aff. 6. has observed. But if in the declension of the Fit the Swooning cease, as it most frequently happens, the Stomach being first strengthened, some minoration of the crude matter must be procured first by Clysters, and then by Vomiting, if the Patient be inclined to vomit. In the mean time Attenuants and Concocters may be given, that a gentle Purge may be given afterwards, if not on the fourth day, at least a little after. But such Fevers as these require an experienced, or at least a very cautious Physician.

IV. Sometimes Swooning Fevers occur, which have their name from Swooning, which seizes the Patient together with the Fever. They are owing to the pancreatick Juice, but such as by its stagnation has acquired a volatile rather than a sharp Acidity, there being in the mean time but little Bile or very sluggish: wherefore without delay it penetrating the Heart by the lacteal Veins, does not onely break out every way and cause a cold Sweat, but it also immediately so coagulates the Blood, that sensibly for a time it does not pass, and therefore no Pulse can be observed till the accession of this exceeding nocent Juice ceasing, the Bile begins by degrees to prevail, and the Patient seems as if he were risen from the dead. That the Swooning may be prevented, I commend this Mixture to be taken by one spoonfull at short intervals. Take of Mint-water 2 ounces, *Aqua vite Matthioli* 1 ounce; or, Take of Tincture of Cinnamon half an ounce, Oil of Cloves 6 drops, Syrup of Scurvy-grass 1 ounce: Let it be given a few hours before the Fit.

Febris Symptomatica, or, A Symptomatical Fever.

The Contents.

Many Fevers that are reckoned Symptomatical, are essential. I. A vernal Symptomatical from an occult Inflammation of the Thoracick parts, II.

I. **W**E must take good notice (which is of great moment in practice, and is observed but by few) that all Fevers are not perpetually Symptomatical, which are joined with Inflammation of the parts, but some of them are essential, to which the foresaid Inflammations use to succeed: For it usually happens, that after the Blood, corrupt or full of bad humours, has caused a Fever, it is disturbed by Nature, and, as hurtfull to it self, is expelled to the weaker parts, or such as are fit to receive the humour, whereby an Inflammation is produced in them, which does

not cause the Fever, but is rather succedaneous to it. Thus we may frequently observe in our practice, that in the beginning People are sick for a day or two, before a Pain of the side and other signs of a Pleurisie appear: Thus many on the third or fourth day fall into a Phrenzy; thus all Arthriticks almost, before they are taken with a pain, swelling and inflammation in their Limbs, use to be ill for a day or two of a continual Fever: Thus they that are taken with an *Erisipelas*, have a Fever for some while, before it appears. The disposition of the Urine shews as much, which in such Inflammations manifestly bewrays marks of putrefaction contained in the Veins: for at the beginning it appears crude, but in process of time it shews signs of Coction daily increasing. Very corrupt Blood also is taken out of the Veins, which things would not be, if such Fevers were onely Symptomatical, or simply depending on those Inflammations.

II. In the Spring-time, especially towards the latter end of Spring and the beginning of Summer, a sort of Fever uses to invade at that time, which although it want the pathognomick signs of a Pleurisie or a Peripneumony, yet it is as a Symptome, in respect of some Inflammation lurking about the spirital parts, for there is no pain of the side, no great difficulty of breathing: wherefore suspecting it to be a bare Fever, I sometimes inclined to treat my Patients in the same method as I used to doe in curing Fevers. Nevertheless, afterwards I reckoned with my self, that this season of the year was unfit for producing Fevers which run into continuity; for of themselves, they do as it were part into pieces, and place themselves among the intermittent kind, or they turn to Pleurisies and such sort of Inflammations; moreover also I took diligent notice of the Blood that was let in this sort of Fevers, and it looked just like the Blood of Pleuriticks, I also observed a redness in the Cheeks, and a certain propensity to bleed at the Nose, though a Vein had been opened before; besides, I found a little cough, and some obscure pains in the vital parts sometimes. These things therefore well considered, I was at length persuaded, that I must proceed in the same method in this case, as I had often used in the Pleurisie with singular success, and it happily succeeded, as I desired.

Febris Synochus Putris, or, A Putrid Continent Fever.

The Contents.

The Fever must presently be suppressed. I.
The heating of the Blood must be prevented. II.
Nature's motion about the Crisis must be attended. III.
How we must prevent the Symptoms? IV.
What Diet in the Declension of the Fever? V.
When the Crisis is imperfect, what must be done? VI.
When the case is desperate, the Patient must not be given over. VII.
The Diet must not be too thin. VIII.

I. **W**E must endeavour to suppress the Fever immediately at the first coming, and to stop the Inflammation of the heated Sulphur, to which Venæsection especially conduces; for by this means the Blood is eventilated, and the hot particles overmuch agglomerated, and then next to burning are dissipated one from another, just as Hay, that is apt to take fire, if it be exposed to the open Air, its burning is hindered. Moreover a spare Diet must be insisted on, in which nothing spirituous or sulphureous must be used. Let the Bowels and first ways be rid of the load of excrementitious matter, wherefore Clysters will be of use, and sometimes

R. Fonseca,
Conf. 19.
Tom. 1.

Fortis.

Sylvius de
l. B. E.

Willis, de
Febr. c. 11.

times Vomits and gentle Purges, by which sometimes seasonably used and with judgment, the Fever is extinguished at the very beginning, when the Fewel is withdrawn: But if, notwithstanding this method, the burning spread farther, and take the sulphureous particles of the blood more and more every day, let care be taken (as much as can be) that the deflagration proceed without much disturbance.

II. Wherefore, when the Fever is in the increase, if the blood be too effervescent, and distend the Vessels much, with a strong and vehement Pulse, if Want of sleep, Phrenzy, or the Head-ach be very violent, let Bleeding be repeated again, and free transpiration (as much as may be) procured: Wherefore let the Patient keep himself for the most part in bed; let his Diet be spare, of very thin aliment: Also let his Drink be small and plentiful, that the boiling blood may be diluted with a more copious Serum. Clysters are safe and convenient enough. But let Purgatives and Diaphoreticks, and things that disturb the blood much, be as industriously avoided as the blowing of the Wind, when a House is on Fire: But Opiates and Anodynes, that fix and thicken the blood and spirits, must rather be used. Also Juleps and Decoctions, which cool the raging Bowels, temper the Blood, and refresh the Spirits, must be made use of frequently; Acetous Liquours of Vegetables or Minerals, and purified Nitre, because they restrain the raging of the Blood, and quench thirst, are very proper: Let hot and spirituous Waters, cordial and bezoartick Powders (as long as the Disease has no malignity) be avoided. If the blood circulate unevenly, and be carried more impetuously towards the head than the feet, Epithems of the warm flesh or bowels of Animals applied to the Soles of the feet are good.

Idem.

III. When the Fever is in the State, Nature's motion must be carefully attended, whether she will make a Crisis or no. Wherefore nothing must be attempted rashly by the Physician; Bleeding and Purging must be avoided, but when the febrile heat is somewhat abated, after the deflagration of the blood, and signs of coction appear in the urine, if then Nature's motion be too slow, a Sweat, or a gentle Purge may be given. But if all be crude and disturbed, if the urine be still turbid, without a sediment, or secretion of parts, if the Spirits be languid, the Pulse low, if no Crisis, or only what was provoked, precede, no evacuation whatever, either by Sweat or Purge, can be attempted, without manifest danger to life: But we must tarry longer, that the spirits of the blood may recover themselves, may in some measure concoct the excrementitious and crude humours, and then separate them a little. Then let the Spirits be refreshed with moderate Cordials, let the immoderate effervescence of the blood (if there be any) be hindered and its due fermentation sustained, which truly is best performed by Coral, Pearl, and such Powders, for indeed they are dissolved by the ferments of the Bowels, and then ferment with the Blood, and very much restore its weak and wavering motion. In the mean while (Nature labouring) let all obstacles and impediments be removed; and especially the increase of excrements gathered in the first ways must be abated with the frequent use of Clysters.

Idem.

IV. In what manner or method the most urgent Symptoms ought to be treated, it will not be easy to prescribe by certain rules, because the self same must sometime be immediately stopt and quieted, sometime more hastily promoted; and, which is more than all, it may be, at another time they must wholly be left to nature. We must oppose some of them with assuaging and lenient Remedies, and others with rougher and irritative Physick. Yet in the mean time this Rule must be observed in all of them, that we religiously insist in Nature's foot-

steps, who, if she doe amiss, her disorders must be reduced. If she go right, but too violently, she must be restrained; but if she go right, and operate slower or weaker than she ought, it would doe well to promote and aid her endeavours by the help of Physick.

Idem.

V. In the declension of the Fever, when, after the Crisis is over, Nature is above the Disease, all is safe, and there is not much for the Physician to doe, it only remains for him to propound an exact course of Diet, that the Patient may quickly recover his strength without any fear of a Relapse. It is also good to carry off the reliques of the febrile matter by a gentle Purge. In Diet, Men oftneft split upon the Rock of a Relapse, that is, the Sick, after preposterous eating of Flesh or strong Meat, relapse into a Fever; for when the Bowels are weak, and they do not easily concoct aliment (unless it be very thin,) and when the Crisis of the blood is so weak, that it cannot assimilate a strong nutritious Juice, if any thing disproportionate be offered to either of them, the œconomy of Nature is perverted, and all goes to wrack. Wherefore Convalescents must long abstain from Flesh, and must not eat it, till after their Urine be like healthy persons, and does no more grow turbid in the Cold; and then indeed it is best to begin with a dilute Meat-broth, and after gradually to ascend to stronger things.

Idem.

VI. When after an imperfect Crisis the case is doubtful, and the controversie under decision, then a difficult task is incumbent on the Physician. Let Nature's motion and strength be diligently attended, whether she begins to prevail upon the Disease, or to yield to it. If there be signs of Concoction, and strength be good, a gentle evacuation may be made. In the mean time we must help the most urgent Symptoms with proper Remedies, all impediments must be removed, and strength must be restored (as much as may be) by Cordials and a right course of Diet.

VII. When after a bad Crisis, or none at all, all things grow worse, and when the Physician almost despairs of the Cure of the Disease, let him give the prognostick, that the event is doubtful, and much to be feared: Yet he must not so far rely on the prognostick, as to let his fears too much possess him, but still let him provide, as much as lies in Physick's skill, for the health of his Patient, though despaired of, let Remedies be used for the most troublesome Symptoms, and let the Spirits of the blood almost extinct be recruited by Cordials. When we despair of Recovery, let life be prolonged as long as we can, and an Euthanasia at least procured.

Idem.

VIII. In Continent Fevers (because they are always accompanied with great strength) we may give a thin Diet; But after Putrefaction is begun, we must feed the Patient higher, because the Corruption of the humours requires it, according to Galen's opinion, lib. 8. Meth. and 1. Aphor. 17.

I. **Galen** makes no mention of Bleeding in the Cure of a Tertian, *primo ad Glauconem*, nor his Followers, *Paulus* and *Ætius*. Onely *Altiarius* among the Greeks, *l. 3. c. 19.* allows it. "In all Fevers, saith he, it is convenient to let blood, for since, after the spirits, it first of all takes heat, and affects the whole body, if any of it run out, much heat goes out with it. And though it be caused by yellow choler, yet blood which is easily inflamed, affords matter to it, and because it goes over the whole body, it heats it. Wherefore if any of it be evacuated, a great share of the Fever is also spent: For if People in Fevers find benefit from insensible Transpiration, and if it be evident, that the Fever grows higher, when the Skin is stop'd, would it not be better for the Patients, if a sensible evacuation of the humour were made, that distributes the Fever into the body? Blood therefore must be let twice or thrice, and sometimes to fainting."

II. The Arabians, according to *Avicenna*, do not breathe a Vein before the third Fit, which seems rather to rely on experience than reason: Since Bleeding, according to *Galen's* Rules, should always be celebrated in the beginning, when it can be done. For seeing this Ague is terminated in seven fits, after the third fit the State is either present or at hand, at which time, according to *Hippocrates*, nothing is to be moved. Therefore, if the Veins be turgid with much blood, it must be let presently. But if there be no abundance of blood, *Avicenna's* advice must be followed, which I have very often found true by experience: Now *Avicenna* advises, if it be possible, to let blood before the fourth fit; if it be possible that you can let blood after three fits, doe it, saith he. Where we must take notice of what *Gentilis* observes, and it is most true, That an exquisite Tertian begins with a bilious humour, which is not mixt with the blood; but afterwards, in the following fits, it uses to vitiate the blood, and there Bleeding is not necessary in the first fits, but onely in the following, which will be known, if the Urine be first citrine and yellow, and afterwards tend to redness. If therefore blood be let after the third fit, because the fourth is next, which is the state of the Disease, and therefore will be the most violent of all, it must, according to the advice of *Gainerius*, *Gentilis*, and others of the Arabians, be foretold, lest the blame of the violence of the Disease be imputed to the Physician. We must have a care in Tertians, that at the first coming, or immediately after the first fit, we let not blood, for the blood then differs nothing from what is sound; and Bleeding must again be repeated, when the hot intemperature is spread over the whole Mass of blood, which will not fall out ve-

ry conveniently for such as are not plethorick, or are but weakly. This was observed in a Tertian Ague, which a few years ago raged in our City, that the blood which was let at the beginning, looked like that of healthy mens, with no benefit to the sick; but when it was let after the second or third fit, it did good.

III. If a Tertian Ague take a Man, if indeed three fits not omitted, the fourth seize him, give him a Medicine to drink that purges downwards. *Hippocr. 2. de morb. sect. 2. v. 194.* But *lib. de Affection.* he gives a Purge in the fourth fit, which falls upon the seventh day. He expresses the reason of the difference in these words, If indeed he seem to you not to be purged, give a Purge on the fourth day: But if he shall seem not to want a Purge, &c. Wherefore the way of purging in a Tertian Ague will be this, If one full of many humours fall into a Tertian, he must be purged the fourth day; for there would be danger, by reason of abundance of humours, that the Ague might turn to a continual, acute Fever: But if not, purging in the beginning is not necessary; for, as *Hippocrates* said in the forecited place, If in the beginning of the Ague you give a Purge, after he is purged, the Ague returns, and you have again occasion for a Purge. We must tarry therefore till the height of the Disease be over, which in a Tertian Ague, that exceeds not the seventh fit, falls at farthest in the fourth fit.

IV. Although *Hippocrates, l. de Aff.* give a Purge, when onely the third fit is over, to whom also *Celsus* subscribes, yet these great Men onely used it, when some Coction had preceded, because they knew not our gentle Purges: whereby even in the beginning sometimes we carry off abundance of bilious humours with great benefit, when they are thin, and very ready for purging. But we must not therefore give a Purge at the very first, as *Rhases* does erroneously, whom *Avicenna* reprehends. And though *Galen* seems to affirm that thin humours may be carried off by a Purge, yet he means thin, serous and watry humours. For we dare not give a Purge after the third fit, unless manifest signs of Concoction appear, and then we use an Infusion of Rheubarb, with Syrup of Roses solutive, drinking some quarts of Whey of Goats-milk or Barley-water.

V. In a double Tertian it is difficult to chuse the hour for to give a Purge, because often times there are onely three or four hours between the fits, and sometimes one comes before the other is off. The most convenient hour to give them, must be chosen thus, that the Purge may not be given when the new fit comes, but when the first ends, at that distance from the following fit, that before it comes, the operation of the Medicine may be over. But in a subintrant (that is, when one fit comes before the other is off) in the beginning of the declension, as soon as ever it begins to abate a little. And in both cases some Broth must be given three hours after taking of the Physick: yet so as that there may be three hours more after the taking of the Broth, before the next fit come. And so the Physick must be given six hours before the next fit.

VI. Syrup of Damask-roses, although it be gentle and gratefull, yet because it purges onely serous excrements, it can have no place in bilious Fevers, unless the Patient abound with serous humours, otherwise the Serum being voided (which bridleth Choler) thirst, heat and drought are enraged.

VII. In an exquisite Tertian, a *Causus* and other raging Fevers, many, without any other consideration, give things that purge Choler, according to *Hippocrates* his Rule, *l. de Purgant.* Give to bilious persons things that purge bile; and to phlegmatick persons things that purge phlegm. But all bilious Diseases must not be treated with Purgatives, because many give way to Alteratives and other Medicines: For *Galen, 2. de Cris.* says, that Bile is violently moved in Tertians, and disseminated through all the parts of the body

body, and that it purges its self by the violence of its motion: Therefore we should not be so solicitous about the indication of evacuating, as of altering. And in such persons Hippocrates requires Gripping of the Belly and other signs, to adventure on purging: for, 3. de Morb. he says, *But if the mouth of the stomach be not affected, but the griping go down to the belly, give Physick that purges downwards.*

Mercatus.

VIII. The filthy humours contained in the Stomach, Mesentery, and hollow of the Liver, use to produce this sort of Agues, which is brought up sometimes by one Vomit, when it could not be carried off by many Purges, as *Fernelius* observes: And therefore if the Patient be troubled with Vomiting at the beginning of the fit, the Physician would doe well to follow the motion of Nature. Chymists ascend to *Aqua benedicta*, which as it happily evacuates the matter that is lodged in the first ways, so it requires a prudent Physician, who must see that there be no contumacious obstructions in the Bowels.

Rivierus.

IX. An opinion has prevailed among the Vulgar, that a Tertian ague can scarce be cured without a Vomit, wherefore some Medicafters use, under the pretext of necessity, to give a Vomit to all that are sick of this Disease (though they be weak and infirm, not without great peril of their lives) and such as they think unable to bear this Remedy, they leave to Nature. But (as to my own experience it has often sufficiently appeared on the contrary) this is an erroneous practice. And I rather think that, unless in a strong body and inclined to vomit, and when it happens that the Stomach is loaded with excrementitious matter, a Vomit is rarely or never required, but instead thereof a gentle Purge, whereby the humours are kindly carried off, will be of more use; for purging in this case does the same that vomiting, namely, it evacuates the cholechoal Vessels, that Bile being plentifully drawn out of the Blood, the febrile Dyfcrafie may be amended. But when the felleous humour, being pumped up into the Stomach, is voided upwards, great harm is done thereby to the Stomach, and a notable disturbance made in the whole Body; whereas, if the humour be carried downwards by a gentle Purge, it is voided without any trouble.

Willis, de Febr.

X. The facility of the matter to be carried off, and the inclination of Nature must immediately be considered: For if the matter putrefie about the *Viscera naturalia*, it must be carried off by vomit or stool; if in the ambit of the body, by sweat: But so mordacious a matter must never be carried off by vomit, because of the exquisite sense of the Stomach, unless when Nature tends that way, to wit, that it may the sooner be got out of the Stomach; and then we must use warm water; or an epicerastick Vomit may be made of Chicken-broth, altered with Malloes, adding Oil of sweet Almonds and *Julapium Acetosum*, letting alone antimonial and strong Vomits, proposed by Chymists and admitted by *Sennertus*.

Fortis.

XI. It appears to me from several experiments, that Tertian agues have been cured with Spirit of Sulphur and Water, given in the height of the fit and in extreme thirst, whereby plentiful sweat was procured, after which not onely the fit was stopt, but the Disease was perfectly cured. In a less quantity of Water, the quantity of the Spirit must be lessened, lest it be too sowe.

Rivierus.

XII. A Nobleman 25 years old fell into a bastard Tertian in Spring time, when May came on, he desired to drink *Schalwack*-waters, wherefore he went thither, evacuation premised, on his intermittent day; the next day he endured the fit for two hours in bed, when he was thirsty at length, he drank one pound and a half of the Waters by degrees, to quench his thirst, and then being well covered he began to sweat, and quickly the fit ended in a total

intermission. After, by continuing the use of Waters, and gradually ascending to a larger Dose, he once or twice perceived a little of his Ague at the time of the fit; and then he always provoked sweat by taking a convenient potion of the Waters, as his Ague declined, by which means, without using any other Remedies, the Ague totally intermitted, his languishing strength returned, and his former health was restored.

Horstius, l. 1. obs. 12.

XIII. They that have written of the Cure of Fevers, do prescribe in Tertians and other intermittent fevers (or agues) cooling and moistning Juleps, as if Coolers were of use in Agues at all times: For, on the contrary, they are often a cause of the Continuance and Contumacy of Agues, that is, when they are used after the seventh fit, the heat of the humour being repressed: because they fix the humour more, and weaken the innate heat, which is the onely cause of the concoction of the humours. When therefore it is grown old, the Constitution of the Bowels must be taken notice of from the face and habit of the whole Body. He that is of a firm habit of body, and has a vegete heat, does a long time bear the use of Coolers and Moistners without harm, and is helped thereby, if his Liver be hot and dry, and the humours be sharp and raging: But, on the contrary, if the innate heat be languid, and the humours be pituitous and melancholick, the Fever will be protracted a long time by too cooling and moist things. We must therefore distinguish in what Agues heat and thirst require to be quenched by Coolers and Moistners, and in what, to be wasted by an attenuating Diet, and by abstinence from Drink. Crude and gross humours, by a thin Diet, abstinence from Drink, and the use of Concofters, being conquered by the innate heat, are easily dispersed and vanish, or turn into the nutriment of the Body. But hot and sharp humours require to be asswaged by cooling and moistning things; yet so as neither violence may be offered to the bowels, nor to the innate heat.

Enchirid. Med. Præd.

XIV. Every morning I would give some clarified Juice of Plantain, with one ounce of Wine, not strong, but weak. For so not onely respect will be had to apertion, but strength will be added to the natural parts. How much the Stomach and Liver are spoiled by Aperients onely, if the use of them be continued too much, Experience abundantly testifies.

Ab. Seyller, Epist. 4. apud Schotzium.

XV. Drinking of Water is very good for Tertians, because it properly extinguishes the burning of Choler, if there be the Conditions which *Galen*, 9. & 11. *Metb.* and in other places, requires: But he forbids the giving of it before signs of Coction, because it hinders attenuation and digestion of tough humours, and causes difficulty of breathing, convulsion and trembling in some. But *Averroës* tarries not till that time, because the Patient in the mean time is in danger of having his innate heat extinguished by the febrile: and because the damage done by the cold Water is less than what would be done by the burning Heat: for by drinking cold Water there is onely danger of lengthning the Disease; by the violent Heat, of Death. Besides, Coction is a sign the Disease is overcome, and when the Heat is quenched, drinking of Water is useless: Therefore when Bile is raging, cold Water may safely be given. When it is cooled, and the state of the Disease is over, it will be useless, because the humours will grow crude again with the Water, and new occasion will be given to Obstructions, and lengthning out of the Fever, especially in Natures that are obnoxious to Obstructions, as the melancholick.

XVI. Because in the place of Putrefaction, in long Fevers, a certain Infection, like to a Ferment, is usually bred and left behind, whereby the humours, though not so very bad, are fermented and corrupted: Therefore to extinguish this ferment,

ment, and stop the humours, convenient Evacu-
tions premised, we may proceed to the use of the
Peruvian Bark, which must be given in the begin-
ning of the fit with Malmsey Wine, in manner and
quantity as is well known to all Physicians.

Fortis.

XVII. A Tertian ague is sometimes prolonged by
a hot and dry intemperature of the Liver, which
continually produces fewel for new fits. As I have
often observed in several, who were of a dry and
squalid habit of Body, and altogether cholerick,
and without any store of humours, they have had
a Tertian for three or four months, especially in a
hot season of the Year. Violent Purgatives, and
violent Aperients and Heaters are hurtfull to such:
But they must be treated with a cooling and moist-
ning Diet, and with Juleps and Broths of the same
quality: And the superfluous humours must be pur-
ged away by degrees with emollient and cooling
Clysters, *Cassa*, Tamarinds, *Catholicon*, and Syrup of
Roses, but in this case Baths of sweet water espe-
cially doe wonders, by extinguishing the hot and
dry intemperature impressed on the Bowels, which
the Patient may use without Sweating. Sometimes
also the length of a Tertian depends upon an indis-
position of some part, especially of the Liver or
Mesentery, which cannot be cured by Purgings ne-
ver so often repeated, because the ill quality re-
mains in the part, and daily gathers new humour,
which maintains the fits: And this ill quality is
removed by Diureticks, Sudorificks, and other dis-
solvents. Things endued with such qualities are,
Wormwood, lesser Centaury, *Carduus benedictus*, root
of Dittany, Burnet, Tormentil, &c. whereof deco-
ctions may be made, to be given several days be-
fore the fits.

Enchir. Med.
pract. &
Niverius.

XVIII. Many are ignorant what *Galen's* skill was
in giving of Wormwood in Tertian agues. In cu-
ring of them, this among many other is one Indica-
tion, to purge store of bilious humour by stool and
Urine: Another is, to strengthen the mouth of the
Stomach, much molested with bile. Wormwood
performs these things, of which *Galen* 6. simpl.
"Wormwood has an astringent and bitter, and also
"a sharp quality, both heating and cleansing, and
"drying and strengthening. Therefore it drives
"down the bilious humours of the Belly by stool,
"and purges by Urine: But it purges what is
"bilious in the Veins, most by Urine; therefore
"it does no good, when it is given for Phlegm con-
"tained in the belly. And *Dioscorides* lib. 3. cap. 23.
"It has an astringent and heating virtue, it purges
"bile which sticks to the Stomach and Belly, it pro-
"vokes Urine. Therefore Wormwood is given for
these two Reasons, to purge Bile, and to strengthen
the Stomach. It does no hurt because hot: for its
substance is not given, but its decoction or infusion
in Melicrate, as *Galen* said; besides, onely the leaves
are infused; that is, a small quantity to cause heat:
To say nothing, that if it doe a little harm, it need
not be valued in respect of the good it does. They
doe amiss who give the juice.

Augenius,
l. 7. tom. 1.
Epist. 8.

XIX. A Woman 45 Years old, after a disorder-
ly Diet, was taken in the latter end of May with a
Tertian ague. I neglecting the Ague, betook my
self to restrain the fierceness of the sharp Salt re-
dounding in the Patient, and not without success;
for when I had given her of the volatile Salt of Harts-
horn half a scruple, with 6 grains of Salt of *Carduus
benedictus*, and 5 grains of Salt of Wormwood, but
the first time, and that one hour before the fit, it
not onely came later by two hours, but held her
much more mildly. Wherefore insuing on this Me-
dicine, and when because of its nauseous taste she
began to loath it, I made it into Pills with a little
crum of Bread, and I cured her.

Georgius So-
gerus, Misc.
Cur. an. 72.
Obs. 244.

XX. A Gentlewoman was taken with an exqui-
site Tertian ague, she obstinately refused all that I
prescribed, in the mean time the Disease grew
worse, and for eight fits it grew stronger and

stronger every fit. I visited her a little before
her ninth fit, and when she refused to take
any thing inwardly, I order bottles filled with
hot water to be placed here and there about her,
to make her sweat against her Will. She on the
contrary commands the bottles to be taken away,
I being not at all moved with the clamour of my
Patient, order the Maids to observe my commands,
and to force her to sweat against her Will, remem-
bring that of *Hippocrates* 2 Epid. We must endeavour
that anger may be provoked in such as are pale.
Now (said I to my self) if anger must be provoked,
that the blood may be diffused through the habit
of the body, and dispell paleness, perhaps it may also
drive out the Ague, and open the inward obstruc-
tions, the cause of the present mischief. Nor did
my Augury deceive me, the Ague ceased forth-
with, and though she was outrageous angry, it
stopt, and never returned any more.

Borrichius,
Misc. Cure
ann. 72.
Obs. 234.

XXI. In the height of the fit, to allay the heat,
cooling Epithemes of water of Cichory, Roses,
Plantain, Vinegar of Roses, &c. may be applied
to the Liver. Yet we must have a care, that the
waters lie not upon the Liver, when Sweat is at
hand; for they might hinder its coming out.

Enchir. Me. l.
Pract.

XXII. Those Remedies, that use commonly to
be applied to the Wrists, are not to be rejected al-
together: for the opinion of the Vulgar is not
onely satisfied with them, because they think ma-
ny are cured with these remedies, but also they
may doe some good by communicating their virtue
to the heart by the large Arteries, which run to
the Wrists.

Riverius.

XXIII. The Diet in a Tertian ought to be thin
and spare. Wherefore it is commonly said, *That
we must starve an Ague*: and common Experience re-
futes, that by abstinence the fit is kept off beyond
the usual time. Two things especially should be
observed about Diet. 1. That the Aliment be thin,
and that nothing sulphureous or spirituous be given:
for so the Conflagration of the blood is lessened.
2. That when the fit is upon one, or coming, no
food be given, wherefore in abstinent persons the
fit is lighter and sooner ended.

XXIV. Not a few lusty young Men, in a fit of
a simple and exquisite Tertian, have been killed in
three hours space, with abundance of clothes laid
on them, by such as onely had respect to the Cause,
they being spent with thirst and sweat.

Fernelius.

XXV. If a Tertian ague, because of the ill con-
stitution of the Patient, or through some errors in
Diet or Physick be so settled, that after a long con-
tinuance the fits grow still worse; and if they be
very weak with a continual lowness of Spirits,
Thirst and Heat, with loss of Appetite, want of
Sleep, a weak Pulse, red Urine, and full of Con-
tents, a little different Method of cure must be in-
fisted on. In this case we must first endeavour to
take away the Dyscrasie of the Blood; wherefore
the Patients must be kept onely with a thin Diet, as
Barley or Oat-meal grewel, with opening roots boi-
led therein (wholly abstaining from broth of meat.)
Let the Belly (if need be) be kept loose with the use
of emollient Clysters, and (omitting Catharticks)
I judge we must principally insist on digestive Me-
dicines onely, which may thin the Blood, and gen-
tly carry off its ferous impurities by Urine, and
on strengthners, which may strengthen the Bowels,
and recruit the Spirits. To this purpose, Apozemes
well prepared of herbs and roots that are gen-
tly diuretick, also Elestuaries made of temperate
Conferves, with salt Nitre, or the fixt of herbs,
and testaceous Powders, and Spirit of Vitriol mixt
therewith, are very conducing. When the Crasis of
the blood is a little amended, as if the Urine be
yellow, and not so high coloured, if sleep be qui-
eter, and thirst and heat abate, then Remedies to
stop the Ague fit may very properly be used: where-
fore febrifuge Epithemes may be applied to the

H h

Wrists,

Wrists, and to the Soles of the Feet: Also the Je-
suits Powder, or its *succedaneum*, or Powder of bark
of Ash, Tamarisk or Gentian, may be given in
white Wine with Salts mixt with them. After the
fits are removed, and the Patients are come to
their strength, and begin to have a Stomach, and
to concoct their Viduals, gentle purges will be
proper: they must yet abstain from high feeding,
and from any thing that has flesh in it: And no
question, but they will recover every day without
either strong purging or bleeding.

Willis.

XXVI. The time of intermission: with *Avicenna* nine
hours before the fit, with us, if the Patient be apt
to faint, and if it be summer time, four hours be-
fore the coming of the fit, that by the presence of
the meat perhaps the ascent of the Bile may be stopt.

Fortis.

XXVII. I have seen several young people, and
of more adult age, cured of Tertians, by the fol-
lowing food, without any other Physick or Potion:
But we must diligently consider, whether there be
any obstruction of the Pores, or condensation or
constriction of Body: For in Continual fevers,
which have their rise from bile, wherein we are
solicitous for the opening of the Pores, it must
not be given before evacuation of the whole: Af-
ter bleeding in Continual fevers, it may safely be
given. Take a white Loaf, three days old, cut it
into thin slices, and infuse it in Endive water;
squeeze some juice of sowre Orange upon it, then
scrape some Sugar on it, so that you may onely per-
ceive it by your taste to be sweet and sowre. Let
the Patient eat bread in this manner, on his well
day twice or thrice, and in the farthest declination
of his fit, before he sup any thing. This food has
a great virtue in it of abating the sharpness of the
bilious humour, and besides it quenches the im-
moderate heat of the Stomach and Liver, and streng-
thens both these parts.

Brudus de
viciu Febr-
ci, l. 3. c. 11.

XXVIII. This food is much in use among the
Spaniards, it is cold and a little drying, *Boil Spanish
Lentils in water with Parsly, green Coriander, Oil, Salt
and Vinegar, with a little Saffron*; You may give broth
of Lentils to any in Fevers, except such as are sick
of Quartanes, whom though I think I cannot much
commend them, so I think they are in error, who
forbid Lentils to all Patients; taking it from *Galen*,
2. de r. v. who says, they are not meat for Man, where
he treats of a Pleurisie, in which he forbids Lentils:
But letting alone a Pleurisie, they will certainly
be proper in a Tertian ague from citrine Choler,
if you consider the efficient Cause of the Disease,
and the quality it leaves in the parts. Citrine
Choler is a hot humour, and of a thin substance,
the most penetrating of all humours: Broth of Len-
tils produces the contrary qualities, for it has a
cooling and thickning virtue. Moreover, citrine
Choler by its sharp penetration makes lean every
part it falls upon: Broth of Lentils not onely stiffens
the part, that it is not so easily pervious to the pe-
netration, but by its equal driness it takes away
what is moist: Besides, Lentils are no improper
food, for such as in this Ague do sweat, and are
not relieved thereby. And if you say that according
to *Dioscorides*, Lentils dull the sight of the Eyes, are
difficultly concocted, and cause troublesome dreams,
all these things are attributed to Lentils, not to their
decoction. We do not find these mischiefs in Spa-
nish Lentils; *Dioscorides* writes, that the Stomach is
ill after them, but Spanish Lentils strengthen the
Stomach, and do not make it windy; Italian Len-
tils are larger and whiter, the Spanish are less and
a little reddish, nor do they excite troublesome
dreams, as is delivered concerning them: But if
you will contend that the Spanish have any vicious
quality, it is corrected by the green Coriander.
Whenever therefore you have a mind to thicken
the humours of the Body, or stiffen the parts of
the Body with heating them, broth of Spanish Len-

tils may well be given in meat: And if you make
it with Parsly, green Coriander, Oil, Vinegar,
Salt and Saffron, you will make a food most agree-
able to the ends aforesaid, temperate in the passive
qualities, declining to coolness in the active. *Idem, ibid.*

XXIX. In a pure Tertian some of the Arabians
judge, Men must abstain from all meat, wherein there
is flesh, yea they forbid little birds till an univer-
sal declination of the Ague. Indeed if they forbid
flesh on the day of the fit, I should think they did
well: but if they hold it may not be eaten on
the intermission day, I do not grant it. From *Hip-
pocrates* they affirm that a pure Tertian is judged
within seven fits, that is, contains thirteen days,
but the fourteenth is the term of acute diseases:
And a thin diet is proper for all diseases that are
judged within fourteen days; therefore no flesh
must be given because it surpasses the limits of a
thin diet. Moreover in this ague, bile, as being
too sharp, uses to heat, dry and corrode the parts,
and it is certain, the Stomach and Liver are more
affected with these Symptoms than they should
be, and that their actions are therefore weakened,
wherefore we must feed them with food of easie
concoction, which is of a contrary quality. And
since flesh is not easie concocted, nor abounds with
a quality contrary to the humour, but with a mid-
dling one, it is ill prepared by the Stomach and Li-
ver, whence it comes to pass that a good share of it
is converted into the nature of the humour that
causes the disease. Things therefore must be given
which are easie of concoction, and which are strong
in qualities contrary to the humour: We cannot
find this in flesh, but in herbs, fruits and seeds.
But we use to allow a Chicken or two made ready
with Barley, Violets, Liverwort, Prunes and juice
of Pomegranate, we give this broth in the declen-
sion of the Ague, and at some distance of time, a
forbition of Bread infused one hour in Endive wa-
ter, and on the intermission day we indulge the Pa-
tient Chicken broth, and we suppose that they
who thus prescribe advise well. Indeed a man can-
not invent a more wholesome diet, and which streng-
thens Nature more, and reduces the Body more ef-
fectually to a temper, the morbifick quality being
destroyed. Which we demonstrate thus, In a pure
Tertian there comes a double driness upon the Body,
the one positive, whereby the bile, of a dry na-
ture, affects the Body; the other from the con-
sumption of the natural moisture, which has its rise
from the Blood. We must help either driness: But
that the Physician may sooner help the second with
chicken broth, tempered with cooling herbs, and for-
bitions of the same, than with any herbaceous food,
is manifest from hence, that a great share of this
food is converted into blood, and but a little of
herbs and fruits. And if you imagine that every
the least particle of the body has a faculty bestowed
on it, whereby it attracts, what is agreeable, and
ejects what is troublesome, you must understand,
that Chicken broth or forbition of it, because it is
more familiar to humane Nature, does much more
moisten the exterior and interior particles. Be-
sides, since very little of Meats made of herbs and
fruits, is converted into laudable blood, it either
passes by Urine, or vanishes by the habit of the Bo-
dy, wherefore it is but a little that can be conver-
ted into blood, and moisten all the particles of the
body. Wherefore if we would hinder each driness
of the body, we must not give meat of herbs or
fruits alone, but together with them, things that
afford good nourishment, supplying indigent Na-
ture; for hereby the virtues of the herbs will be
more efficacious, when they are carried to the least
particles of the body: And of how easie concoction
Chicken broth and a forbition of it are, is well
known. Besides, in the intermission of the fit, and
before the accession, I think aguish persons must not
be fed with cooling herbs and meats, because the
herbs

herbs force the febrile heat inwards, and the meats retard the expulsion by Nature, at which time things that cool and bind the body must not be administered, but rather things which drive from the Centre to the Circumference, that we may imitate Nature acting regularly. We learn this from *Galen 8. m. m.* who after bathing, gave the Patient water wherein Parsly was boiled, before his fit. On the Intermiffion day we can doe no harm by giving the flesh of a chicken; for between the past fit, and that which is coming, there are eighteen hours, in which, Nature resting from her by past labour, has gathered strength, so as to be able to concoct a young Chicken, rightly boiled: And there remains the same interval of time to the beginning of the next fit, at which time there is no fear, that the fit will find the meat then unconcocted: for by how much sooner the anticipation is, so much sooner will the Ague end in a pure Tertian. Besides, Meats of herbs and fruits quickly conceive putrefaction from the fervent humour: wherefore horary fruits are of right forbid by Physicians in Fevers. As for what is said concerning the number of days, wherein a Tertian is judged, it does not at all hinder; for we take the form of the Diet from the constitution of the Disease, and the strength of the Patient, and we say, that he whose weakness is a little urgent, must be fed with a grosser Diet, than the disposition of his Disease requires. We say moreover, that they, who are of a rare habit of body, and have thin humours, and are of a hot and dry Nature, must have a grosser Diet given them, by reason the strength of their bodies is sooner wasted. Whence it is manifest that Physicians, who in a pure Tertian feed their Patients both days with a thin Diet, do cast them, that are of a thin habit, and of a hot and dry Nature, into a Consumption: Or, if they be of another complexion, they do, by their giving of cooling herbs and worts, cast them out of a pure into a bastard Tertian: Both which things the Physician must avoid, lest he either make the Disease more dangerous, or prolong it. And if the sick Person be troubled with thirst, it will indeed be much more beneficial, if you give him cold water to drink, (if there be need of it) which will quench thirst far better than to feed him with cooling herbs.

XXX. Whether does a Tertian or a Quotidian require a grosser Diet? Some think a Quotidian requires a grosser Diet than a simple Tertian, because it is longer, and seeing the grossness of Diet, and its contrary, is taken from the distance of the state, it must be, that these Diseases which are sooner ended, require a thinner Diet, and on the contrary, 2. Greater sickness and Symptoms prohibit meat more than weaker ones. But I will shew by three reasons, that they are mistaken, two of them from the Ague, the third from the Cause of the Disease, conjunct and antecedent. Let us suppose for example, two Persons, alike in temperature, age, habit of body, &c. that one of them were ill of a phlegmatick, the other of a cholerick Ague; in all respects alike, but in their Agues, and in the Causes of them; the Diet is taken from the strength, the Disease not prohibiting, and the onely scope of Alimony is preservation of strength, where therefore strength is most wasted, more food is required to maintain it, than where less is wasted, if we may, for the Disease. But it is manifest, that the strength is more wasted in a Tertian than in a Phlegmatick Ague; therefore more nourishment must be given in it, if we may, for the Disease: but we may, for the Patients are free from the Disease, and at perfect ease for a whole day and a night. But it falls out quite contrary in a Phlegmatick ague, so that neither the strength waists so much, nor may we doe so much, because of the Disease, for they are taken every day with their Ague, and oftentimes there is a subentrance of the latter, before

the first be over: Or it is but a very little time that they are quiet, and that, as small as it is, is not without some intrinsick motion, beginning to dispose to the Paroxysm at hand; so that we must of necessity feed the aguish person in one fit before another be off; Or, if you regard that, you may feed him within the time of his disposition to the next fit; which because it is worse, it remains that the first time must be chosen: but when the Ague is not yet off, it is clear, that less, and a thinner Diet must be given, and more and thicker, when the body is free from it, whence it comes to pass, that we must use a thinner Diet in a Phlegmatick, and a thicker in a cholerick Ague. Again, the report is, that the pituitous humour by farther coction is converted into bloud, and may nourish, for in those that are taken with this Ague, the Stomach, Guts, and Mesaraick Veins abound with pituitous excrements, which hinder the dissolution of the antecedent and conjunct Cause. The Conjunct you can no way better waste than by a thin Diet. As to the Antecedent Cause, by reason of the inequality of the pituitous substance, and the diversity of its quality, Nature has much more here to separate, concoct and convert, than in a Cholerick ague, in which for contrary reasons putrefaction is equally conceived. Hence it is manifest, they must be kept with a thinner diet, who have a Fever from Phlegm, than from Choler. Moreover, because of the multitude of the matter, which is usually coincident with this Ague, Meat does much hinder its subtilization, incision and consumption. But in a Cholerick one, as for what concerns the disposition of sincere cholerick humour, Meat does not onely doe no harm, but helps both to repress the sharpness of the humour, and to give a due thickness to an over thin humour. As for the reason alleged from the distance and propinquity of the State, we must know, that the course of Diet must not be directed in all Fevers according to the distance of the State, but onely in such as either by their continuity, or because of their Symptoms, endanger Life within a few days. But a Tertian, especially an exquisite one, is without danger, according to *Hippocrates, 1 Epid.* and how much it degenerates from this, by a mixture of Phlegm with cholerick humour, so far the Ague is not without some danger; for a Quotidian, whether it be nocturnal or diurnal, is not without it, as we learn from him, wherefore upon account of the danger that is in a Phlegmatick Ague, we must keep them that have it with a thinner Diet, according to *Hippocrates, 1. de v. acut.* But if any pain or danger appear, &c. *Galen* consents, who allows one ill of a Tertian, Birds, Eggs, stony Fish, Cock's Stones, &c. But *1. ad Glauconem* in a Quotidian he orders the giving of an incisive Diet, but it is manifest that such an one nourishes less than the things aforesaid. From these things any man may gather, that in a Tertian not pure, where Phlegm is mixt with Bile, a thinner Diet is requisite than in one that is exquisite: The very thing which *Galen l. 1.* teaches. In uncertain Tertians we must take more care, as much as possible, that we neither increase the sickness, nor destroy the Patient's strength, that must be afflicted a longer time. We perceive this farther from him, when in such uncertain Tertians, he orders the aguish to doe it onely every other day, which he did not advise in a pure Tertian: Therefore they that have a phlegmatical Ague, must be kept with a thinner Diet than they that have a Tertian.

Dr. Sydenham's Method of curing Agues with the Jesuit's Bark.

AS for what concerns the cure; it has been now well known to me for many years, how dangerous a thing it is in Tertians and Quotidians (which when they are new, and have put on no type, are still next door to Continual fevers) to attempt one by Sudorifics: For though it be very well known, that as soon as Sweat breaks out, restlessness, and other Symptoms, vanish immediately, and an Apyrexia succeeds, and therefore of consequence it must be Indulged a little, at least not hindered, when the fit is going off, yet it is very evident, that if Sweat be forced more than it should, the Fever which intermitted will prove continual, and the Patient's Life is in a hazardous condition, this man is saved, and the other perishes. The reason is this, unless my conjecture fail me, namely, that this profuse Sweat, when it exceeds the measure of the febrile matter, exalted so far by the heat of the fit, that it may then be cast off by despumation, is the rest of it laid out in inflaming the blood. Therefore while I considered with myself the ineffectualness of this Method, and of other Evacuations, that is, of Bleeding and Purging (both of which by relaxing the tone of the blood protract the Disease,) the *Peruvian Bark* gave me the most certain hope, concerning which I can safely say, notwithstanding the prejudice as well of the vulgar, as of some of the Learned, I never saw, nor could rationally so much as suspect any mischief befall the sick from the use of it. And indeed if I were as well assured of the duration of its effects, as I am of its innocence, I should make no scruple to give it the first place among all Medicines that are yet extant, for it is not only found to be of excellent virtue in this Disease, but also in Diseases of the Womb and the Stomach: So little reason has any man to complain of the unwholesomeness of it.

But the said Bark has got an ill name, for these reasons especially, if I am not mistaken. First, Because all those horrible Symptoms that attend an Ague, when it has tormented a man a long time, are imputed to the Bark, when indeed he has not at all tasted it, or taken it but once. Secondly, Because many reckon, seeing it drives away the Disease by an occult virtue, and not by sensible evacuation, that the matter causing the Disease, which should have been driven out, does lie shut up by the astringent Virtue of the Bark, like an Enemy within the Walls, ready to give new disturbance, and that the Patient is not quite escaped, when he still drags his Chain. But these men do not consider that the Sweats which end the fit, have cast off all that was gathered in the lucid interval of the fit, and there remains only the Seminary of the Disease, to be ripened in time; and that the Bark pursuing the flying fit at the heels, when all Provisions, or the sustenance of the Disease, which should have been sent in, is intercepted, the Bark cannot be said to retain that in the blood, which cannot be found there, unless as in *Embryo*; and therefore must not be held guilty either of those Fits or Obstructions which are commonly objected.

But by what means do we find, that the Bark drives away Agues, by its astringent faculty? He that would prove this, must of necessity first produce other Astringents endued with the like virtue, certainly I have tried the strongest of them, and I could never as yet obtain my end. But what would he say, if it cure some, who after the taking of it, go as often to stool (which happens to several) as if they had taken a strong Purgé? This it is for

a man to be truly wise and to keep himself within due bounds. But if any will deceive himself, and think that he is endued with other faculties, than what are subservient either to *Natural Theology* (that is, that due veneration may be given to GOD the Architect and Moderator of all things, with the profoundest prostration of Mind, which of right he deserves) or to *Moral Philosophy*, (that he may exercise virtue, and accommodate his Manners both to the private and publick good of Humane Society) or lastly to the *Art Medical, Mathematical*, or to some *Mechanick Trade* (which are assitant to the life of all men.) Let this man first draw any *Hypothesis* from the *Natural Philosophy* School, by which he can explicate but only one specifick Difference of things in Nature; for example, let him render a reason, why all Grass is every where found to be green, and no where of any other colour, &c. If he can doe this, I will with all my heart subscribe to his judgment; But if not, I will not fear to say, that all a Physicians care and industry should be bestowed in pumping out the History of Diseases, and in using those Remedies, which Experience being his Guide and Mistress, are able to cure them, yet ever observing that Method in Cure, which right Reason (founded not on speculative Imaginations, but upon the trite and natural way of thinking) shall dictate. I will therefore briefly declare what I have learned by practice, concerning this method, wherein we must give the Bark.

The *Peruvian Bark* (which is vulgarly called the Jesuit's Bark) about five and Twenty Years agoe, (if I remember aright) first became famous among our *Londoners* for curing of Agues, especially Quartans. And indeed for very good reason. Seeing these Diseases were seldom cured before by any other Medicine or method, wherefore they were called *opprobria Medicorum*, and truly were a reproach to Physicians. But not very long after it was damned for two reasons, and those no small ones, and so was wholly disused. First, because it being given a few hours before the fit, according to the received custom of that time, sometimes killed the Patient: Thus I remember it happened to a Citizen of *London*, one Alderman Underwood, and to one Captain Potter an Apothecary in *Black-Friers*. This tragical effect of the Powder, although very rare, did yet deservedly withdraw the best Physicians from the use of it. Secondly, because the Patient being rid of his fit, which would otherwise have come, and it seldom failed, yet within fourteen days he relapsed, that is, when the Disease was new, and had not spent it self by length of Time. Most men being swayed by these reasons, did utterly cast off the hope they had conceived of this Powder formerly: Nor did these value the keeping off a fit for a few days at such a rate, that upon such a score they would endanger their Lives by taking the Powder. But for several years since seriously considering with myself, and revolving, that the virtue of this Bark was not common, I was confident Agues could better be cured by no other Medicine, than by this Herculean one, if what care and diligence was necessary were taken. Therefore I contrived a long time with myself, how I might prevent the danger impending from the Powder, and the relapse, which followed in a few days, (which were the two inconveniences to be avoided) and by the help of it to promote the Patient to a degree of perfect health.

First of all I supposed the danger that was threatened, did not so much proceed from the Bark, as from the unseasonable giving it to the Patient: for when great store of febrile matter is gathered in the body on the intermission days, the foresaid Powder, if it be taken immediately before the fit, hinders the morbid matter from being eliminated in Nature's Method, that is, by the violence of the fit, which therefore being contrary to all reason shut

up,

up, usually brings the Patient into danger of his Life. Now I reckoned I could keep off this Mischief, and also put a stop to the breeding of febrile matter anew, if as soon as one fit was off, I should presently give the Powder, that the following might be stopt, and if on the intermission days, at set times now and then, I repeated the same, till a new fit were coming, and so I might gradually, and therefore safely, thoroughly tinge the mass of blood with the salubrious virtue of the Bark.

Secondly, since the Relapse (which usually happened within fourteen days) did appear to me to arise from thence, that the Blood was not sufficiently saturated with the Virtue of the Febrifuge, which how efficacious soever, yet was not sufficient at one time, utterly to exterminate the Disease, therefore I guessed nothing would be so good for preventing the fit, as a method of repeating the Powder, even when the Disease was conquered for the present, always at just intervals, that is, before the virtue of the preceding dose were wholly spent.

My Mind therefore, swayed with the weight of these Reasons, dictated to me the Method, that I now use. Being called to one ill of a Quartane-Ague, (suppose on Monday) if the Fit were to come on the same day, I meddle not, but onely put him in hopes that he shall be freed from the next. And therefore the two intermission days, (that is, Tuesday and Wednesday) I give morning and evening two drachms of the Bark, finely powdered, in Wine, or in form of an Electuary, with *Syrupus de Rosæ siccis*, what is sufficient, drinking upon it a draught of Wine. On Thursday at which time the fit is feared, I order nothing, because usually none comes, the reliques of the febrile matter being despumated, and ejected the blood by the usual sweats which completed the preceding fit, and the gathering of a new *minera*, *fomes*, or matter, being prevented by the repeated use of the Powder on the days between the fits.

And however, lest the Disease should return (which was one of the foresaid inconveniences) on the seventh day, after the Patient had taken his last Dose, I certainly give him the same quantity of the said Powder, (that is, one ounce divided into four parts) in the same method that I gave the former. But though the cure once in this manner repeated often make an end of the Disease, yet the Patient is not wholly out of harms way, unless he vouchsafe to observe his Physician, when he prescribes him the same Method at the same distance of time a third or a fourth time; especially when the Blood has been weakened with some preceding Evacuation, or the Patient has unadvisedly exposed himself to the cold Air.

But though this Medicine have no purgative virtue in it, yet through the peculiar temper, and Idiosyncrasie of some Bodies, it sometime happens that the Patient is violently purged after the taking of it, as if he had taken a strong Cathartick. In this case it is altogether necessary to give *Laudanum* with it, that it may not be able to perform this operation, so plainly contrary both to its own Nature, and to the Disease.

I take the same method in other Agues, whether Tertians or Quotidians; for upon the ending of the fit I immediately fall upon both, and I follow and press them (as much, that is, as their Nature will bear) by the repetition of the Medicine in the but now mentioned interstices of the fit; yet with this difference, that whereas a Quartane can very rarely be got off under an ounce, divided into Doses, the others may be so subdued with six drachms, that they will give some truce at least.

But Tertians and Quotidians, though after a fit or two they may seem to intermit, yet oftentimes they afterwards turn into a kind of Continual Fevers, and come onely to a Remission, even on those

days they promised an Intermission: especially when the Patient has been kept too hot in Bed, or has been punished with Medicines to carry off his Ague by Sweat. In this case taking an opportunity from the remission, be it never so little (for that is all I have left me to doe) I give the Powder just after the fit (as near as I can guess) giving a drachm and a half every sixth hour for four times, making no matter of the fit, because otherwise in too short an interval the Alexiterick virtue of the Bark cannot be communicated to the Blood.

And though the Agues which are now rise among us, after one or two fits incline to Continual Fevers, yet since they must be referred to the Intermitent (or Agues) I make no scruple to give the Bark, even in those that are most Continual of this kind, which being repeated in the manner aforesaid, will certainly bring the Patient to an Apyrexia, if the constant heat of the Bed, and the unseasonable use of Cordials, have not made it a Continual Fever; in which case I have more than once observed, the Bark would doe no good. Nor was it ever yet my hap to observe, that Wine, in which the Bark is given (which one might well suspect) did any harm to one in an Ague; but on the contrary, Heat, Thirst and other Symptoms of the Ague, did presently vanish, after taking 6 drachms, or to the value of them in another form, notwithstanding the Wine.

And whereas there are some that cannot bear this Bark in form neither of a Powder, nor of an Electuary, nor yet of Pills, I give them an Infusion made in the cold; that is, I infuse for some while two ounces of the Bark grossly powdered in a quart of Rhenish Wine. This Liqueur being several times passed through *Hippocrates* his Sleeve, and of a clear colour, is not so offensive, but that it may please the most delicate Palate; four ounces of the said Infusion having stood several days, seem to contain the virtue of one drachm of the Bark given in Powder. Which because it is neither ingratefull, nor burthens the Stomach, it may be taken twice as often as any other forms of that Medicine, namely, till the fits are gone.

For Children, whose tender age might be endangered by such a quantity either of the Powder or of the Infusion, as will conquer the Disease, I order 2 or 3 drachms of the Bark to be boiled in a pint of French Claret, to a consumption of a third part, and one spoonfull or two of the Colature to be given twice or thrice a day, according to their age, till the Fits come no more.

It must be observed moreover, that because the short interstices between the Fits in Tertians and Quotidians, do not allow time sufficient, fully for to saturate the Blood with the febrifuge virtue of the Bark, it cannot be expected, that the Patient should certainly miss the next fit after his taking it, as it usually happens in a Quartane: for in those the Medicine often will not perform the promised cure under two days.

And we must take notice, that if the Patient, notwithstanding the abundant caution, given before, do nevertheless fall into a relapse (which seldom happens in a Quartane, than in Tertians or Quotidians) yet it will be the part of a prudent Physician, not to insist too pertinaciously upon the method of giving the Bark at the said Intervals; but according to his judgment, to attempt the cure by some other means, to which, above all other things, the *Decoctum Amarum*, as they call it, is generally held greatly to conduce.

As to Diet and Regiment, the Patient must neither be kept from meat nor drink, which gratifie his Stomach; Horary Fruits notwithstanding, and cold Liqueurs (as very much helping to weaken the blood, and to bring the Ague again afterwards) ever excepted. Let him eat therefore Flesh, ease of Concoction, and of good juice, and let him use a little

a little Wine for his ordinary drink; by which thing alone I have sometimes restored sick persons, even them, whose bodies being weakened with the frequent recourse of the Ague, have eluded the virtue of the Bark, which was salutiferous to others. Nor ought the Patient unadvisedly to commit himself to the cold Air, till the Blood have obtained its pristine vigour anew. But above all things all manner of Evacuations whatever must be avoided, since even the most gentle purge, nay, a Clyster of Milk and Sugar, does most certainly bring the Patient into danger of the Disease, and perhaps into the Disease it self again. This is what I had in brief to say concerning the use of the *Peruvian Bark*: Nor had I a mind to indulge the pomp of Medicines: Since indeed they that add any thing to the Bark besides a Vehicle, necessary to transmit it to the Stomach, do offend either out of Ignorance, in my opinion, or out of Knavery, which a good man abhors from his Soul, who as being part of the same common Nature, can never be induced by any private profit of his own to put a Cheat upon those of his own Tribe.

Sydenham,
Epist. Re-
sponfor. 1.
Pag. 22.

Medicines especially made use of by Eminent Physicians in various Fevers and Agues.

In Fevers, properly so called.

Agricola.

Augustin.

Borellus.

Crato.

Crugner.

Faber.

Van Hel-
mont.

1. **OIL** of Antimony is good almost for all Fevers. ¶ And Spirit of Sal Ammoniack.
2. This is a most excellent food in a Colliquative Fever; Take the finest flower of Spelt, put it in an earthen Vessel, with which and Sugar make a *stratum super stratum*, till the Vessel be full. The proportion must be 4 ounces of Sugar to a pound of Flower. Bake this in an Oven till it be dry. Take 3 ounces of this meal, mix it with broth of flesh, and a fourth part Rose-water, and white Saunders half a drachm. Make a Ptisan. Of which let the Patient take as often as he pleases.
3. Take a piece of Cyprian Vitriol, infuse it in 5 pounds of water, drink 6 ounces of this blew water every morning for 6 days, if the Patient vomit, he will be cured within ten days.
4. The Sengreen, called *Vermicularis*, bruised with Vinegar and Barley-flower, and applied to the right *hypochondrium* in a Fever, that is not excessive burning, does much good. Believe the experienced. ¶ If the Fever be not very burning, make two bags of Barley flower, as big as ones back, and apply one to the whole back, when it grows hot, expose it to the Air, and apply the other.
5. Oil, Salt, or Magistery of Mother of Pearl, first made with distilled Vinegar, or precipitated with Spirit of Vitriol, is an excellent Sudorifick and Antifebrile, if it be mixt with Essence of Antimony, made of *Antimonium Diaphoreticum*. I call it *Mixtura Antifebrilis Diaphoretica*.
6. Butter of Pearl is a stupendous and very effectual remedy for the cure of a Hectick.
7. Take clear Aloes, the best Myrrh, and the best Saffron, each 1 ounce and an half. Let the two former be powdered fine. Put them in a capacious and strong Glass, seal it by melting the neck of the Glass, distill it in a moderate heat, lest the Glass break, till you see the whole mass concrete at the bottom, and the clear Oil to circulate with the water on the sides of the Glass, then open the neck of the Glass, and pour in some Cinamon Water, and distill them in wet Sand, upon which scalding water must gradually be poured, till nothing more will

come over the Alimbeck; and with this Medicine I have cured both Quartans and Continual Fevers.

8. It is found by experience that Burnet infused in warm Water presently cures a continual Fever. ¶ Water distilled off Water Melon is a great Medicine with some, for it presently quenches the heat of the blood. ¶ The water of Gourd is excellent in burning Fevers. A fresh Gourd is coated with fresh Paste, it is baked in a hot Oven with bread, and the water which is found within it is kept; or a whole Gourd is cut in pieces, put in a new earthen Pot, is baked and strained out, and a little Sugar is added.

9. In burning Fevers *Bezoardicum Solare, Martiale, Lunare, Joviale* or *Antibellicum Poterii* are very good, to stop the ebullition of the blood, and they are good in periodical continual Fevers. Hofmannus.

10. This is a certain experiment in burning Fevers; Take Speedwell, Mouseear each half an ounce. Make a Powder, infuse it in Wine, let it stand a Month. Let him drink often of it; it expells heat and cures any Fever. Kornthave.

11. *Nitrum Vitriolatum* (that is the coagulated Spirit of Vitriol) is good in all Fevers. Mynsh. ht.

12. Take of Spirit of Vitriol, Urine, each one pound. Mix them, distill them by retort, and a Crystalline Butter will ascend. Of which give one scruple, mixt with 3 ounces of water or phlegm of Vitriol, to the sick party. It is so excellent a Medicine that it has saved many mens lives; for it extinguishes the internal preternatural heat. Poppius.

13. *Sal Prunelle*, from half a scruple to half a drachm, is an excellent alterative, and much exceeds others, if it be dissolved in *Cardus Benedictus* water, and drunk, it cools powerfully, and quenches thirst. ¶ *Acidum Tartari Aluminatum* has a secret virtue in opening obstructions, and especially in curing Tertian agues. Rolinccius.

14. Take of choice Manna, as much as you please, distill it by a Cucurbit with a gentle fire, you will have an insipid Spirit; an excellent Sudorifick in all Fevers. Schroderus.

15. The Water or Phlegm of Alume is much esteemed by some in all sorts of Fevers, where, if it were mixt with its Spirit, it is like, it would be more effectual. Angelus Sala.

16. Take of Mucilage of Quince seeds, Fleawort seeds, Oil of Violets, fresh butter washt, each 1 ounce, white Wax what is sufficient, anoint the *Spina dorsa*. It is admirable good in Fevers of such persons as cannot take Medicines. Ben. Vict. Faventinus.

In a Malignant, Spotted, Pestilential Fever, and the Plague.

1. In the Plague, and after taking of Poison, the Essence of Antimony is very good. ¶ *Mercurius viræ fixatus* is very good in Pestilential Fevers. ¶ Also the flowers of *Antimonium diaphoreticum* are an excellent remedy in Pestilential Fevers. ¶ An excellent Bezoardick Vinegar; Take of the root of the greater Fern, Butterbur, *Angelica*, Tormentil, Elecampane, each 1 ounce, Powder of Serpents, red Myrrh, shavings of Hartshorn, each 1 ounce, flowers of Marigold, *Tunica*, each 2 pugils, seeds of Sorrel, Citron, *Cardus Benedictus* each 1 drachm and an half, Saffron 1 drachm, *Terra Sigillata*, Venice Treacle, each 1 ounce and an half. The best Vinegar 4 pounds. Mix them, set them in the Sun, You will make a Vinegar, than which nothing is more effectual, 1 spoonfull whereof taken in the morning, will preserve you safe from the Plague that day. ¶ Vinegar of Antimony. The dose 1 scruple, that day you take it, it preserves you from the Plague. ¶ Spirit of Nitre is of great use in Malignant Fevers. ¶ This diaphoretick mixture is of great efficacy in Malignant Fevers; Take of Spirit of *Terra Sigillata* 1 drachm, Tartar, half a drachm, Treacle 1 drachm, Magistery of Coral,

J. Agricola. Coral, Pearl, each half a scruple, Water of *Carduus Benedictus*, Citron, each half an ounce. Mix them. Make a draught for 2 doses.

Bartholinus. 2. Our Country people, in the Plague time, defended themselves onely with Vinegar of Marigolds, and they escaped without danger.

Boellus. 3. A certain Man cured several of the Plague, onely by applying a piece of the Monocerot's horn, and with an infusion of it in common water for their ordinary drink; and he gave this for prevention, for they that used such water, were not infected with the Plague.

Champegius. 4. Some say, who have tried it, that if in the beginning of a Pestilential fever, one drink 2 or three ounces of Juice of Marigold, and cover himself with Clothes, he will be free from that infection.

5. This powder was used with great success in the Plague, and is given by many (but erroneously) as a common cure for Fevers; Take Sugar-Candy 3 drachms, Ginger 2 drachms, Camphire 1 drachm. Mix them. The dose 1 drachm in Water and Vinegar, in which Tansie has been boiled, especially when the season is not hot. ¶ I could also prove the efficacy of this Eleatuary by good witnesses; it is made also of Camphire; Take of *Scordium* 3 drachms, Tormentil, White Dittany, Zedoary, Gentian, *Angelica*, Cloves, each 1 drachm, Saffron, Camphire, each 2 scruples. Mix them. Make a powder, sprinkle it with Water of *Carduus*, in which are dissolved of Treacle 2 drachms, and with Syrup of Juice of *Carduus*, and of *Scordium*, make an Eleatuary. The dose 1 drachm, or more, in *Carduus*-water.

¶ Nothing is better, to preserve children from the Plague, than Bole-Armenick, with a little Tormentil and Citron-pill powdered, which may be strewn on their Meat. ¶ In a Pestilential fever the following Water is a truly royal Medicine, and is highly commended; Take spirit of Malmsey-wine, eight times distilled, 8 Measures; put to it of root of Tormentil, *Serpentaria*, each 1 ounce, *Angelica*, Zedoary, each half an ounce, Citron-peel, Cinamon, each 1 drachm; let them stand 3 days in a glass stopt, and in a warm place, then these things being cast away, and strained out first, pour this Elixir again into a glass, and let these things, tied up in Linen, be put into it; Take of fresh *Sperma Ceti*, Ambergrise, best Rheubarb, each 2 drachms, Musk half a drachm, let the Vessel be well stopt, keep it. One drop of it, in Summer time, is taken with Sugar of Roses, for preservation; to those that are infected, one ounce may be given, with Water of *Carduus Benedictus*, Scabious, or *Scordium*, adding 1 drachm of this Powder; Take of Hartshorn, Unicorns-horn, each 1 scruple, *Terra sigillata* half a drachm, Pearl, Emerald, each half a scruple, Camphire 7 grains; 5 grains of Bezoar-stone may be added; and every 3 hours 1 scruple of this powder may be given with Water of Water-lily, Sorel, &c. and when the Patient has taken it, let him Sweat. ¶ I have learned by certain experience, that to pour some Spirit of Malmsey-wine upon Amber, and keep the Glass close stopt, and every morning to take a few drops with Bread, is an excellent preservative from the Plague.

Crito. 5. Elixir Alliatum is reckoned a great Preservative from the Plague; it is made thus; Take twenty heads of Garlick cleaned, bruise them, put them in an Alembick, pour to them rectified Spirit of Wine, till it stand four inches above, distill it in *Balneo* by cohobations, always putting in new Garlick; in the last distillation add of Camphire, tied in a rag and hung in the nose of the Alembick, 1 drachm, distill it as before. ¶ There is a most secret virtue against the Plague in the herb Milfoil whole, with its Flowers, with which onely the Buriers use to guard themselves in the greatest Plagues.

Deodatus. 6. A compound Oil is made of Scorpions, and is much celebrated amongst Chymists, it is commonly called *Oleum Clementis*, it shews wonderfull effects in

Poison, and in all Pestilential Diseases, reviving them that are half dead; which Oil I highly commend in this case, if the Arteries, and the region of the heart be anointed onely with it.

Pet. Salius
Diverfus.

7. A Salt is made of the ashes of a burnt Toad, with Water of *Carduus Benedictus*, or Meadow-sweet. The dose half a drachm in *Carduus Benedictus* Water, for a Sweat in the Plague, which it powerfully promotes, and it is very good to cast the Plague out thereby.

Faber.

8. I take Earth-Toads, and hang them up; and dry them in the Air, then I lay them on a hot Tile, to make them dry, I powder them; but first I anoint the Pestil and Mortar with Oil of Scorpions, that the Powder may not get into my Nose, and hurt my brain with its poisonous quality; I take of this Powder 1 ounce, sowre Leven 4 ounces, the best Treacle 1 ounce, leaves of green Rue 1 handfull. I mix all these things well with Honey, and apply it to the Bubo twice or thrice a day. This Plaster draws the Poison out of the body wonderfully to it self; a whole Toad dried, and applied to a Bubo does the same.

Guilh. Frz.
bricus.

9. This is a most noble Bezoardick Tincture; Take of *Mistura simplex* 3 ounces, Berries of the herb One berry 3 drachms, *Scorzonera*-Root 4 scruples. Make an Infusion and digest them. The Dose 1 scruple to 2 scruples.

J. Mich. Pehr.

10. I especially commend *Flammula Jovis* to be applied to a Bubo, because it draws much, and raises blisters, by which the Poison is purged out.

Hier. Fabri.
cias.

11. This Plaster is commended above all others for Swellings and Pestilential Buboes; Take a Frog and a Toad dried, powder them, add thereto of Gum *Opoponax*, Frankincense, each 2 ounces, *Galbanum* 1 ounce, *Serapinum* 4 ounces, *Bdellium* 3 drachms; pour to them Rose-vinegar what is sufficient, boil and dissolve the Gums, add of Camphire, Oil of Sulphur each 1 ounce. Fry them in a Frying-pan into the form of a Pultes, and apply it hot to the Swelling, repeating it every six hours. ¶ This is very good to anoint Carbuncles; Take of *Unguentum Basilicon* 1 ounce, fat of Vipers 1 ounce, extract of *Scordium* 2 drachms, Treacle 2 drachms, Juice of Lemons, Oil of Scorpions, each half an ounce. Mix them. Make an Unguent. Anoint the Carbuncles, ¶ Above all other things, which by experience are found good to preserve from the Plague, Vitriol is the thing: To the stronger sort it may be given to 1 drachm dissolved with Honey and Water; for the weak it is prepared with Rose-water, and ground very fine, at least four times, and so half a drachm of it may be given with Wine or Honey. ¶ In a Malignant Spotted Fever this Cordial-water of mine is most excellent; Take of Juice of Goat's Rue, Sorrel, *Scordium*, Citron, each 1 pound. Mix them. Add 1 ounce of Treacle: Infuse them in warm Water, then distill them in *Balneo*. The dose half an ounce morning and evening. ¶ This is a most excellent Powder, which preserves from, and cures the Plague; Take of White Vitriol (it is first powdered, and infused in water, then it is dried, and this is done three or four times, adding a little Camphire) of White Dittany, Tormentil-root, each 2 drachms. Make a Powder. The Dose is 1 drachm in Water of Plantain, or Roses, or Sorrel.

Rod. à Fons.
seca.

12. This Powder of mine was very good; Take of Root of Dittany, Tormentil, Bole Armenick prepared, *Terra sigillata*, each 3 drachms, Roots of Gentian, Butter-bur, *Tunica*, each 2 drachms, red Sanders 1 drachm, shavings of Ivory, Citron-Pill, red Coral, Bone of a Stag's heart, Root of Zedoary, each half a drachm, prepared Pearl, both the *Bebens*, each 2 drachms, Amber, Unicorn, each half a scruple, leaves of Gold and Silver, each No 3. Make a Powder. The Dose in preservation 1 drachm, in the cure 4 Scruples.

Forestus

13. This is an excellent preservative against the Plague; Take of Sugar-Candy powdered 4 ounces, imbibe

imbibe it with dulcified Spirit of Salt, (which is thus made; Take Spirit of Salt, and Spirit of Wine, each equal parts, sublime them three or four times by a retort, and they will unite inseparably, and grow sweet) to the form of an Electuary, of which take one drachm in the morning fasting; it will keep off all Putrefaction.

14. In a Malignant Fever, this is a great secret. Nitre steeped in Vinegar of Roses, and Juice of Prick-madame, applied to the Pulsæ, asswages heat and pain.

15. *Heinissus* his Pestilential Oil, which is made of rectified Oil of Amber, Citron, and Camphire, the dose, from five drops to half a scruple, does wonders in Pestilential Fevers.

16. I have observed, that *Bezoardicum minerale*, is not onely of use in Malignant and Spotted Fevers, and the Pleurisie; but is also a present remedy in the Plague.

17. *Contrayerva*-Root is a most excellent Sudorifick in Spotted Fevers.

18. Take the Rinds and Seeds of Twelve Lemons, Juice of *Scordium* three pounds, Juice of Sorrel, Galangal, Scabious, *Carduus benedictus*, each 1 pound, shavings of Hartshorn four ounces, old Treacle 6 ounces, being cut and bruised mix them together: distill them in *Balneo*. The dose 1 ounce, by it self, or mixt with other Liqueurs.

19. The Volatile Salt of Hartshorn has an excellent diaphoretick virtue in burning Malignant and Pestilential Fevers.

20. A Liqueur against the Plague, Take of the burning Spirit of Juniper-berries 8 ounces, rectified Spirit of Tartar, Spirit of Stag's blood, each four ounces, Spirit of Vitriol 20 drops, Cinamon, *Angelica*, Myrrhe, each half an ounce, *Laudanum opiatum* 2 drachms; infuse them in *Balneo* for twenty hours, then let the thin be poured off the thick by inclination, and keep it. This liqueur wonderfully resists the Plague, and other sorts of Poisons. The dose from 15 drops to 20.

21. This Powder is highly commended for cleansing infected houses, yea, and for preserving them from the Plague, if it be used for a fume morning and evening; Take of Juniper-berries four handfulls, Rue, Elecampane root, outer rind of Birch, Savine, Goats-horn rasped, each two handfulls, leaves of Oak, Myrrhe, each 1 ounce. Mix them. Make a powder. ¶ I have formerly given this powder in the Plague with good success; Take of Bezoar-stone twelve grains, Bone of a Stag's heart 1 scruple, prepared Emerald, prepared Jacinth each 7 grains. Make a Powder for two doses in some convenient water.

22. They say, that Scabious, with Nitre and fresh Hog's lard, is a divine remedy, to discuss a pestilential Carbuncle.

23. The Air must be corrected with a fume of Rams, or Goat's-horn: for there is a great and a peculiar safeguard in this, and it defends ones clothes. ¶ The Place where people sick of the Plague have lain, and are taken out, is cleansed from the contagion by nothing better, than crude Sulphur; if it be burnt in the room close shut, and the fume be kept in some time, and then the Windows set open, to let it out.

In Tertian Agues and Quotidians.

1. This hath been experienced in Tertian Agues; Take of Juice of Gentian condensed 1 drachm, or of the liquid 1 drachm and an half, Chicken broth 3 ounces, *Spec. Diarrhodon Abbatis*, and *Aromat. Rosat.* each 1 Scruple. Drink it.

2. For Tertians; Take a draught of the best White-wine, boil it half away, and then drink it, it will cause one to Vomit much Water. I have cured many so.

3. This is experienced for a Bastard-Tertian;

Take Spiders Webs cleansed, mix them with *Unguentum Populeum*, and make them into six Pills, two of which must be applied to the Pulsæ of the Temples, two to the Pulsæ of the Arms, and two to the Pulsæ of the Feet, laying Vine-leaves upon them, and binding them on three hours before the Fit.

4. One may very well purge on the Fit-day. I have often tried it, and in most the event always answered; In Tertians I doe this after the third or fourth Fit, in Quotidians later.

5. Chamæmil-water, drawn off the Juice, is an excellent remedy for long and pertinacious Agues, if one ounce be given in the morning fasting for two or three days. I have often experienced it.

6. I have not found a better remedy, as well for preservation as cure of Tertian Agues, than *Oxy-saccharum simplex*, which resists putrefaction, because of the Vinegar, and Juice of Pomegranate, or Syrup of Lemons. For by taking some of it every day, I preserved my self from an Ague; and others have cured themselves of Agues by it. ¶ I have found by long experience, that *Carduus benedictus* is good in a Quotidian Ague, though most use it a-miss in all Fevers.

7. Juice of Water-Cresses, Vinegar, each what is sufficient, with a little Salt. Give two or three Spoonfulls before the Fit in all Agues.

8. The fixt Salt of Wormwood becomes a more generous Medicine, if, when it is dissolved in Cichory Water, as much *Sal Prunelle* be added, and then they be coagulated together according to Art. Half a drachm, or a drachm-weight given them that are sick of a Tertian, in warm Beer, sweetned with a little Sugar, to make them sweat stoutly, is a Medicine much to be preferred before the *Antifebrile Crollii*, made of Shells.

In Quartane Agues.

1. Spirit of Sal Ammoniack is an excellent Secret in a Quartane Ague. The dose is from 5 drops to 10 in Cichory-water.

2. The powder of a Man's Skull given in drink Agricola. to one when he knows not of it, has been experienced to cure Quartane Agues.

3. Sal Ammoniack seven times sublimed, and *Benedictus*, made quite spiritual, taken in a draught of Wine or Beer warm, let him Sweat 8 days in the morning. This is excellent good for Quartans.

4. This is an experiment against a Quartane; Take of Seed of St. John's-wort 2 drachms, Ashes of Man's Skull 1 drachm. Mix them for 3 doses, 3 hours before dinner.

5. Some reckon this for a great secret; They take 2 drachms of Leaves of Betony powdered in an Egg, four hours before the Fit, and they repeat it three or four times on other days. And certainly it is admirable good in an inveterate Quartane.

6. After Universals, I anoint the Chine with Oil of Chamæmil and Dill, each alike mixt and hot, beginning at the Neck, down to the Buttocks; and after anointing I wrap him in warm Linen, and when I have done this thrice, not onely the cold Fit, but the Ague ceased.

7. A scruple, or half a drachm of crude Alume in the water or decoction of lesser Centaury, if it be given 5 hours before the Fit, and Sweat, if possible, provoked, I cannot sufficiently commend it in a Quartane.

8. I use to drive away Quartane Agues with a Plaster of a few dissolving and absterfive things, and it never failed me.

9. In a Quartane Ague the following Plaster was the Secret of the Prince of Anhalt, which sometimes so extracts the febrile Infection, that now and then it raises blisters; Take of Pepper, Salt, Saffron, Garlick, which is covered with earth, of each alike, what is sufficient. Beat them in a Mortar to the form of a Cataplasin, put a little in a Rag, and

and apply it to the out-side of the Ring-finger, of the left hand, take it off the same hour it is applied, and repeat it before the Fit.

Hartod.

10. Flowers of Sal Ammoniack are excellent in a Quartane. ¶ Roots of crude *Asarum*, though crude, they provoke Vomit, with great perturbation, yet boiled in Water, and not in Wine, they are changed into a deopillative Diuretick, which the Spiciness that lies in it, does shew. *D. Oheimius* fled to this, as to his last refuge, in tedious Fevers, depending on inveterate Obstructions of the *Hypochondria*.

Hofmannus.

11. Against a Quartane, as a famous thing, I recommend distilled Oil of Pepper 4 drops, given with extract of Gentian. Also Flowers of Sal Ammoniack, or the Salt thrice sublimed, with extract of Spleenwort, or lesser Centaury. Also Spirit of Nitre prepared with Sulphur. Also Spirit of Vitriol of Mars and Venus, given in Gentian or Treacle-water. And outwardly I must highly commend Sage, Rue, and Shepherds-purse with Vinegar, applied to the Pulfes.

Christ. Lan-
gius.

12. I was in fear of the Fourth Fit of a Quartane, and before it came I drank a little Spirit of Wine, or *Aqua vitæ*, sweetened with sugar, and I saw no Fit, but had an end of my Ague, to my great joy.

Lotichius.

13. One that was ill of a double Quartane, was cured with 3 doses of an infusion of *Senna* in *Aqua Riverii febrifuga*, which is nothing else, but Spring-water with Salt of Tartar, whose wonderfull effects we experience continually in all long Fevers, and in diseases coming from Obstructions. ¶ Extract of Germander, with Salt of Tamarisk, made into Pills, is commended as a most excellent Medicine for a Quartane.

Riverius.

14. I have often tried the following Medicine with success; Take of Leaves of Elder, Sage, Dovesfoot, Rue, each half an handfull, Marigold 2 handfulls, Salt and Wine alike, a third part. Beat them together, apply it to the Writs before the Fit. Remove them when there is occasion.

Rondeletius.

15. I can say from my own experience, that if Seed of St. John's wort be bruised, and given in Wine before the Fit, it does much good.

Medicines.

I. THE Daughter of N. after a grievous pain in her Loins, fell into a troublesome *Fistula* in her Groin, which, by continual running, walt-

ed her body, so that in a short time she departed this life. The cutting of her up shewed an evident *Caries*, in a bastard rib, which continually sent out a sharp *ichor* into the flesh below, which being eroded, there came a long and anfractuous *Fistula*, which was beyond the Skill of Medicine. You may see the defect of the same Art in *Fistula's* of the *Anus*, whose beginning sometimes runs very high, either to the Loins, or the *Vertebrae* of the Breast, or sometimes to the Shoulders; whose inaccessible *Caries* the tortuous winding of the *fistula* does hinder from being searched with a probe, which also hinders injections, designed to cleanse the Ulcer, and does exclude the Hand, which might take out the vitiated Bone. Which nevertheless not being timely taken away, the Patient dies before his time, and the *fistula*, deriving its original from a remote *Caries*, does obstinately resist the Physicians cure. Whose lips though you clip open, and amplate (which yet is very good in cutaneous *fistula's*) nevertheless you will lose your labour, and you can never come to the farthest end of these sinuous windings; from whence so many branches, and so frequent rivulets descend by muscles and tendons, which lie deep, that though a Probe be never so dextrously put into such a tortuous *fistula*, yet it can never reach or remove the *Caries*, that is the cause of a continual *fistula*. *Tulpius, obs. 28. l. 3.*

II. The cure of *fistula's* is two-fold, one fictitious, false and palliative, the other true. Of the Palliative, *Galen* makes mention, *lib. de Tum. p. n. c. 4.* and *Avicenna 4. 4. tr. 4. c. 2.* When the *fistula* is dried up within, and healed on the outside, a *sinus* (or hollow place) remaining within; which is performed by putting drying Medicines into it, by keeping a good Diet, and by purging of the superfluous humours. By this means the *Sinus* is closed for a time, the orifice healing up: But afterwards, when any moisture is gathered in it, an Abscess is formed again, and the *fistula* returns. I do not deny, I sometimes use this false cure for the Patient's consolation. For having purged the body, and ordered a spare diet, I leave off Tents (which I had a long time put in such incurable *fistula's*) and apply a new Sponge, wet in some Mineral water, and wrung out; or in some *lixivium*, or Lime-water. By this means, the whole was closed outwardly, so that the *fistula* seemed to be cured, the Patients being dismissed. This sort of cure sometimes wanted success, sometimes not: for the integrity and soundness of the Skin conduces much to the cure of external Diseases, because the natural Heat expires by the Aperture, and the natural functions of the part are not performed. But when the orifice is stopt, the natural heat is kept in, then it performs aright the work of concoction, it digests and discusses excrements; so that sometimes the *sinus* fills up, which it would not have done, if the *fistula* had remained open. Therefore the palliative cure of *fistula's* must not be rejected.

III. A *fistula* in the *Perineum*, if it come from an internal cause, is never perfectly cured, it is indeed sometimes skinned over, but it quickly returns, upon the least internal cause, yea, and sometimes if it be stopt up for a while, grievous Symptoms do follow. Once, when I had scarce cicatrized a *fistula* in a Man of Threescore, which followed a caruncle and retention of Urine, and the Patient after the cure was continually tormented again with difficulty of Urine, and other Symptoms; I was forced to open the *fistula* again, upon which he not only recovered, but lived to above Threescore and seventeen. Hence Patients may learn, not to be so solicitous for the cure of such *fistula's*; for they are a proper passage for the excretion of much excrements, which, by the benefit of Nature, are cast off thither, from the Liver, Kidneys, Bladder, and the Spermatick Vessels: For I have observed, that they who have had such *fistula's*, are usually free from other

Aqua pē-
dens.

other worse Diseases. I reckon Ulcers in the *Peritonæum*, when they come to the Urinary passage, almost incurable, because of abundance of Excrements, wherewith old men abound, and the weakness of the excretive faculty, arising from *Venus*, or from some other cause, so great, that it cannot discharge the Urine, full of excrementitious humours, by the anfractuons passage of the *penis*. We need not despair of a cure in Children and young Men.

Hildanus.
cent. 5. tit. 75.

IV. Some must not be cured, according to *Hippocrates* 6. *Epid.* 3. 39. & *lib. de Humor.* 3. that is, such as discharge the body of superfluous humours, and preserve from other Diseases: Such are in the lower parts, old ones, and remote from the principal parts. They must not be closed, yea rather, they should be opened, if they chance to heal up. I have known people, who have had a *fistula in ano*, without any mischief, for 25 years, yea, it has done them good. Besides, some *fistula's*, in their own nature, refuse a cure, according to *Albucasis*, *lib. 2. cap. 28.* such as reach to the great Veins, Arteries, or Nerves, the *Peritonæum*, Guts, Bladder, *Vertebra's* of the Back, and Ribs, such as are in any joint of the hand, or foot: For they do not admit convenient Medicines.

Fo: ab A.
q: apend-
te.

¶ I have often seen *fistula's* near the Eyes and the *Anus* cured, and pernicious Symptoms, and death have followed thereupon. I have also seen *fistula's* cured outwardly, and a *Sinus* left within, especially about the *podex*, out of which, sharp *Ichores* coming, by transumption, to the neck of the bladder, use to raise such Symptoms, as are ordinary in the Stone of the Bladder.

Sanctorius.

V. In one, who 27 years since broke his Leg, the wound could not be so healed, but that an *Ichor* would always be ouzing out of it, the Sore at last ending in a *fistula*. A few years after he was sent to *Madrid*, the care of his body being neglected, because of his business; yet he found, after a few Months, that the troublesome *Serum* stopt, and ran not again for 3 years. When he returned to *Copenhagen*, the *fistula* opened by little and little, and after the old manner ran a Serous matter daily for several years. He is sent again into *Spain*, upon some affairs, the wound closed up again, and did not run any thing for six years, while he abode at *Madrid*. Then returning to his Country, he found the hole opened again in a few Months time, which is not yet healed up, the moist Air in the North opening what the dry Spanish Air had shut.

Borrichius
in Adh. D-
nich.

VI. One had two deep *fistula's* under the Arm-pit, all that I had tried being in vain, I cured him thus: I burnt both the *fistula's* to the very bottom (they reached to the very ribs) with a red-hot Iron, without a Case, several times, till the *Callus* was wholly and equally taken off the *Sinus* of the *fistula's*. To deterge the *Eschar*, I used Tents, first of all long and thick, anointed with Butter, afterwards with a digestive: When laudable *Pus* appeared, I put in others anointed with *Unguentum ex betonica*, which I made every day shorter and shorter. These things being removed, I applied a Bolster of Linen under the Arm-pit, compressing it with a strait Ligature, I perfectly cured the Patient in 20 days time.

Marchetti,
lib. 3.

VII. We must never proceed to burning of the *Os Sternum*, because it does not scale off, as others do, which when they are not altogether corrupted, but only in part, if they be burnt, only what is perished falls off, the laudable part remaining: Which does not so fall out in the *Os Sternum*; because it being tough, does not so easily scale off: but rather, when the burning reaches to the internal part of it, the whole corrupt part must of necessity abscede, not indeed in 30 or 40 days time, as other bones do; but sometimes in three years; wherefore I advise you, never to burn the *Os Sternum*: For I have observed it to abscede in many not under 2 or 3 years: So that the cure is easier and safer by Abrosion.

Idem, lib. 39.

VIII. One had a Swelling with a *fistula*, above the left side of his Collar-bone, whose orifice was so narrow, that it would scarce admit a pin's point. About six months before, he had been ill of a Fever, which ended in an Abscess in that place. The Ulcer, after it had remained open for four weeks, closed up, a swelling and hardness remaining behind. When he told me this, I prescribed things to evacuate bilious humours, wherewith he abounded, for the matter was yellow, which the *fistula* voided. Then I dilated this very narrow *fistula*, not with any cutting instruments (whereby not only the pectoral Muscle, which had been sufficiently hurt by former incisions, might be more hurt, but also there was fear, that if this were not used dextrously, the Jugulars being dissected, or but a little hurt, might bleed the Man to death) but with a tent of dried Gentian-root, tied to a thread: The next day I took it out swelled with a bilious ichor, and black at the end, and searching the quality of the *Sinus*, and cause of the colour, with a Probe, I found some part of the clavicle rough and moveable: Then I put in a root thicker than the former, anointing the adjoining parts, to hinder imminent inflammation; The third day I put in a bigger piece of Gentian-root, and so consequently, till the hole seemed wide enough: The sixth day I filled the *fistula* with round pieces of prepared Sponge tied to a Thread: The seventh day I took them out, and the *fistula* was wide enough for taking out of the Bone, which I took out: The eighth day the blood stopping, I strewed this powder on the found bone, uncovered; Take of Root of Florentine Orice, *Aristolochia rotunda*, *Peucedanum*, each 1 scruple and an half, *Euphorbium* half a scruple, Myrrhe 1 scruple: I applied dry Lint, till it was healed up with firm flesh: I deterged the Ulcer every day, by strowing on some powder of white Sugar (which mitigates Bile) every day, and I cicatrized it with *Diapalma* Plaster. For the hardness remaining, *Emplastrum Oxaleum* was applied, with a Linen-cloth three double, strained out of a decoction of strengthening things in Wine, making convenient ligature, that the relicks might be dissolved, and a new afflux of humours might be hindered. Thus within a month and 14 days the Patient was cured.

Scultetus,
Anatom. obs.
51.

IX. A young Man 18 years old, had a hard Swelling in his right side, which came to suppuration: Being ill treated, it turned into a callous *Sinus*, or *fistula*: Universals premised, to search the quantity and quality of it, I dilated the extreme narrow orifice, with the pith of Elder very much writhen, so that it would admit a round Probe, with which gently put in through the corruption, I touched a rough edge of the rib. To consume the *Callus*, I put in a tent of lint writhen, anointed with this Ointment; Take of powder of Henbane Seed 1 scruple, burnt Alum, burnt Vitriol each 1 scruple and an half; Butter waht in Plantain water what is sufficient. Mix them. When the *Callus* was extirpated, I put in a tent of Lint, the top whereof, wet in *Decoctum divinum*, I strewed with powder of *Euphorbium*, to correct the Caries of the rib: but the rest of the tent, that I might prevent the regeneration of *callus*, I anointed with this Unguent; Take of *Unguentum de Betonica* 1 ounce, *Unguentum Egyptiacum* 2 drachms, I put it in every day, till the corrupted rib, after 2 months, cast off some scales, which being taken out, I applied every day a less tent, dipt in Ointment of Betony, till the Ulcer being filled up with solid flesh, was cicatrized by benefit of *Ceratum divinum*.

Idem, obs. 42.

X. When an Ulcer is old and fistulous, we must have recourse to that admirable magisterial Syrup, described by the most excellent Fallopius, *lib. de Venerib.* c. 38. which does good with the greatest success, in any inveterate *fistula's* of the breast, whereof this is a description, to which we also add China. Take of Root of Marshmallow, Leaves of Millefoil, Horehound,

Horehound, Mugwort, Dock, Coleworts very green, Burnet, Bramble tops, Roots of Madder, with Leaves of *Aristolochia rotunda*, Feverfew, lesser Centaury, Honey-suckle, each half an handful; *Olibanum*, half a drachm; *Sarcocolla*, 1 ounce; Seeds of Anise, Plantain, Fenil, Hemp, each half an ounce; Saffron, Rheubarb, greater Centaury, each 2 ounces; odoriferous White-wine what is sufficient, China 6 drachms. Bruise the Ingredients, infuse them in the Wine for 24 hours, boil them without Water, and strain them, add of the best Honey 4 pounds. Let this Decoction boil up one ebullition with the Honey. The Dose is 5 ounces in the morning.

Epiphanius.
Ferdinandus,
Hist. 32.

XI. Some order the *Fistula* to be filled with Hellebore, and that it must be done for three days; but when I did it once in a *Fistula* of the *Spina dors*i, near the region of the Heart, the Patient fell into frequent Swoonings. Therefore I think it no safe Remedy, especially if the *Fistula* be in any part of the Breast.

Chalmetus.

XII. A Matron had been long troubled with a Defluxion upon her Teeth in her nether Jaw, and when she had not taken care to get the Tooth pulled out, upon which the Defluxion fell, at length, after an Inflammation and great Pain had risen about the roots of it, an Abscess gathered, which breaking outwardly, the Pain abated. The Ulcer degenerated into a *Fistula*, which remained even for fourteen years. Having undertaken the Cure, I found the upper part of the Tooth, at the Root whereof the *Fistula* was, eaten away almost to the *Alveolus*. I drew out the Root of the Tooth, afterwards I applied a Tent anointed with my Ointment, to waste the Callosity; when the Callosity was eroded, I srewed every day some Powder of precipitate upon it, and applied *Diapalma* Plaster, nor did I alter the Medicines before the Ulcer was perfectly cured, which was within a month. And the Root of the Tooth was eroded, unequal, and covered with a stony matter lying on it in manner of Scales.

Hillanus,
cent. 3.
obs. 33.

XIII. A Lying-in Woman had an Inflammation in her right Breast from concretion of Milk, which being too much hardened with Dissolvents, turned to an Abscess, then into a deep *Fistula*, with a *Callus* of a narrow orifice. Her Body being purged, I sufficiently dilated the narrow orifice of the *Fistula* with tents of Gentian; afterwards I wasted the *Callus*, by once putting in a tent of Lint, smeared with the following Ointment; Take of Mercury precipitate, burnt Alum, Verdigrisee, salt Nitre, each equal parts; Mix them with Whites of Eggs beaten, as much as is sufficient. It quickly extirpates the *Callus* of *Fistula*'s (but in the nervous parts especially, and such as are endued with an exquisite sense, not so pleasantly and safely) When the *Callus* was consumed, the Ulcer was cleansed with *Unguentum Aegyptiacum*, incarnated with *Unguentum de Betonica*, consolidated with *Ceratum divinum*, and the reliques of the hard tumour were dissolved with *Ceratum oxaleon*. *Emplastrum ex spermate Ceti Mynsichti* cures hard Swellings from curdled Milk.

Scultetus,
Armanus,
obs. 43.

XIV. When a *Fistula in ano* reaches to the Gut, the finger anointed with Oil of Roses must be put into the anus, and also a *falceolus* (or a crooked Incision-knife) with it, and when the finger is thus put in, the *falceolus* must be so guided, that it do not err in cutting into the callous substance, that it may also cut the hæmorrhoid Veins. I approve rather of Incision, than of Detraction of the *Callus*, which is made by ligature. But we must take notice, that the *Callus* must not reach above four inches lengthways into the Gut: Otherwise we must use only a palliative Cure; or when it reaches to the bladder or the os sacrum, proceeding beyond the sphincter, because the sphincter would be cut, and an involuntary excretion of the *feces* would follow. Then therefore it must be twice every day fomented with a Decoction of Mullein, and the Decoction must be injected.

Chalmetus.

XV. *Celsus*, l. 7. c. 4. and his Followers do cut a *Fistula in ano* which does not penetrate, by breaking through the bottom of it, they gather both ends of it with a twisted silken thread (yet red silk single, because of its tenuity and tincture, cuts and eats in sooner) and so straining it very hard with a little piece of a stick transverse, they cut the whole sinus, or the Interstice of both holes. But *Aquapendent* deservedly rejects this Incision of *Fistula in ano* by a thread, because it is too slow, and puts a Man to continual pain: And, he says, it must never be used, but when People are afraid of the Knife. *Scultetus*, Fab. 45. propounds a new way of Cure by the edge of a *Syringotomus* and a thread, which joins the opinions of *Celsus* and of the later Chirurgeons.

XVI. Yet *Fistula in ano* in old Men, deriving their original from some old Fluxion, as from the Hæmorrhoids of long continuance, cannot safely be cured, unless, before the Wound be healed, an Issue be made in the Thigh three or four inches above the Knee, for evacuation of the matter daily gathered, which used to be evacuated by the old *Fistula*.

Scultetus.

XVII. Penetrating *Fistule* are very easily and safely cured without an actual Cautey, which some commend, to consume the *Callus* in *Fistula*, if when the *Syringotomus* is passed through, the Blood be stoppt, and Hæmorrhagie prevented, and the *Callus* washed with this Medicine; Take of Mercury precipitate half a drachm, Honey of Roses half an ounce. For the sphincter, according to *Hippocrates*, lib. de Hæmorrh. may safely be cut any way, without prejudicing its office, if but an eighth part of it be left untouched; otherwise an involuntary excretion of the *feces* would follow, and then most certain Death.

Idem.

Medicines especially made use of by eminent Physicians.

1. I have seen *Fistule* of the Feet often cured with this Remedy: First wash them with a Lye of Vineashes; then use an Unguent made of Sugar, Olive, Mercury and Wine, each equal parts.

Borellus.

2. This wonderfully cures *Fistule*; if they be often washed, and the hollow of them filled with an Arcanum mixt with Tincture of *Aristolochia rotunda* drawn with Spirit of Wine.

Faber.

3. The Bulb of Cornflag mixt with Starch, Vinegar and Foxes grease, cures *Fistule* and running Sores most effectually.

Laurentius.
Gius.

4. This is highly commended by many Authours, especially for drying up and healing a *Fistula*; Take of Water of the Vine 2 ounces, Malmsey wine 1 ounce, Honey of Roses 10 drachms, Myrrh, root of *Peucedanum*, each 2 drachms; *Sarcocolla*, *Aloe Epatiza*, each 1 ounce and an half; Mix them. Let them boil up onely once moderately, and let it be injected by a Syringe into the *Fistula*.

Pocettus.

5. A wonderful Water for *Fistule*; Take of green Shells of Wall-nuts, let them stand in the shade, distill them; Take of the distilled Water 7 pounds, distill it again, add of Honey 2 pounds, distill it again and keep it for use.

Pravotius.

6. After Universals are used, some commend this Potion; Take of Sanicle, Mugwort, Speedwell, *Saracene's* Confound, Winter-green, each 1 ounce; Savine 1 ounce and an half, Horse-tail half a drachm; Boil them in White-wine; Make a Potion, which if you would have more effectual, in every Dose mix of prepared Crabs-eyes half a scruple. For Savine and Crabs-eyes are very good to expell Bones, Pus, broken Veins and the like.

Schnier.

7. This is a most secret Medicine; Take of Tops of lesser Centaury 3 handfuls, Roots of greater Plantain fresh 1 pugil, Leaves of Germander, Scabious, each 1 handful; New-wine 3 pounds and an half. Boil them to half. Let the Herbs and Roots be well pounded and strained out hard; then boil them on a gentle Fire, to the consistency of Honey, and keep it.

Stokkerus.

8. This is an approved Medicine for a *Fistula*; Take of Leaves of red Cabbage, and the Seeds of the same, Roots of Madder, each equal parts: Bruise them in some Wine, and boil them to a third; strain out the Liqueur, and boil them to the consistency of Honey. Give two spoonfulls morning and evening every day. ¶ *Filipendula*, and the Grains found at the end of its Root are good for the same.

Tulpius.

Medicines.

I. Some Women that are ill of a virulent *Gonorrhœa*, hiding their fault under an innocent name, pretend they are ill of the Whites, because in both cases abundance of filth is voided. But the Chirurgeon may easily distinguish the Whites from a *Gonorrhœa*, and he may satisfy himself, a *Gonorrhœa* will never be cured without Salivation.

Parvus.

II. The cause, which continually breeds the corrupt humour is sometimes in the Womb, sometimes in other principal parts. They are therefore grievously mistaken, who ascribe the cause of all that comes from the Womb, and of the suppression of the *Menses*, to the Womb alone. For in what Women cold Bowels, or obstructed, or scirrhus, have caused Crudities, an ill Habit or Dropsie, the corrupted humour being poured into several parts of the body, often falls upon the Womb, and tending that way purges the Body, which is done in some others by urine or stool.

Fernelius.

III. Seeing the Whites depend upon a *Cacochymie*, and it being drawn to the Veins by Phlebotomy, may infect the mass of Blood, there seems no room for Phlebotomy. Besides, since in this chronical Disease strength decays much, and the Body is often brought to a consumption, it appears, it ought not to be farther wasted by Bleeding, and be deprived of its Aliment. Yet it is thus determined, that if this Flux be not solitary and pure, but be mixt with a little blood, and look red, then blood may be let: As also if there be any great heat in the Liver, or acrimony of the bilious juice joined with this Flux. But in other cases, especially when the case is grown inveterate, it is better to abstain from Bleeding.

Riv. rius.

IV. A Woman of forty had been long troubled with the Whites; after many Medicines tried in vain, she was perfectly cured with taking a laxative Ptisane every day for a month; The Composition was this; Take of cleansed *Senna* 1 drachm, Coriander-seed prepared and scraped Liquorice each 1 drachm and an half, Spring-water wherein three drachms of Tamarinds and 1 drachm of Mastichwood have been boiled, one glass. Infuse them cold for one night, and let her take the colature two hours in the morning before she eat.

Idem.

V. There is no small difficulty to tell, whether Diureticks be proper? for they do not only pro-

voke urine, but the *menstrua* by heating and attenuating the humours contained in the Veins. Yet they are approved by all Authours, and by *Galen* himself, who used them in *Boethius* his Wife. The reason is, because Diureticks provoke urine primarily, and the *menses* secondarily and as it were by accident: then, the Kidneys draw the ferous matter continually, the Womb onely receives it. Wherefore it is likely, that the greatest part of these humours will go to the urinary passages.

Idem.

VI. There are some that maintain, all manner of Womens Whites may be cured by diuretick Medicines; but they are in a manifest error. The causes must be distinguished, and according to the various nature of them, different methods of cure must be insisted on. This Disease comes sometimes from the fault of the whole body, and sometimes of the womb. When the whole body is full of an ill habit or *cacochymie*, or the Liver is obstructed, or the Spleen or Stomach is weak, or the Head supplies excrements, then the womb may be thus troubled. We must consider, what humours abound, hot or cold, and how they are affected. For it shews they are hot, when this excrement is sharp and scalding, so as it eats whatever part it touches, and sometimes causes itching and Ulcers, or chaps with a sense of heat, besides, when it is stinking and yellow. It will doe well to consider here the temperament natural and acquisitious, the preceding causes, the habit of the body, and season of the year. Contrary signs will indicate contrary humours. When therefore the flux in the womb comes from these causes, when hot and bilious humours abound, I most suspect this method of cure by Diureticks: For who can think that a hot Disease can be removed by very hot and drying Medicines? for suppose, that evacuation made by Diureticks may doe some good, certainly greater damage will ensue from increase of the quality. Indeed it is my custome to reduce such bodies to a good state, Universals premised, with a Ptisane well prepared, adding the greater cold Seeds: And, I do profess, I have often cured with Asles and Goats milk uterine fluxes, that have been given over by other Physicians, in thin bodies, with sharp humours. This is my peculiar method; The first four days I give a quart of Milk, that the whole Body may be well purged, and to two quarts for fifteen days, but boiled; and the days following to forty one (in which time I generally found they were cured) I give Milk chalybeate. A most certain and rare Remedy. But if the humours be cold, and there be obstructions in the Bowels, if there be a cold intemperature of the whole, or of the principal parts, who will deny Diureticks given according to art? Does any one doubt, but they have a deobstruent, heating, cutting and cleaning faculty?

Augensius.

VII. *Hippocrates*, 2. de morb. Mul. vers. 116. among divers sorts of Uterine fluxes, propounds the yellow flux, in which what is voided is like a rotten Egg, when the white and yelk are mixt together, from a mixture of which a yellow colour arises, which indicates vitelline Bile. *Hippocrates* cures this Flux thus: First, he purges upwards with Hellebore, and then downwards, that the whole body may be rid of the *Cacochymie*. Secondly, he orders a moistning and temperate Diet, which may cool and qualifie the hot and sharp humours: Then he gives astringent Medicines, which may stop the flux, and he changes the Diet into a contrary course. If the Disease do not give way to these things, he returns to the former Diet, which he orders to be continued so long, till the acrimony of the humours abate, which the heating of the Ulcers, the abating of the Inflammation, and what is voided, will shew: for then he finishes the Cure by Exsicants and Astringents. Let the Moderns consider this method of cure, who go the contrary

contrary way to work; for they order a drying Diet first, and give a decoction of the same faculty to drink: And after they have by this their way of Cure brought the sharp, fretting humours to the height of acrimony, they betake them to a contrary method, and turn their whole intention to cooling and moistning: For they do not observe, that by giving Medicines in the beginning which are actually moist and potentially dry, they commit a double error, because they increase the humours by actual humidity, which should rather be diminished by evacuations; and by the drying and hot quality, the hot and sharp quality of the same humours is intended, and the hot intemperature of the Bowels, if there be any, is increased, and by this means they give assistance to the Disease and its Cause. And whenas afterwards they betake themselves to coolers and moistners, they commit other two faults; for by coolers they clog the body full of sharp humours, and by moistners, they dissolve the humours, which had formerly been dried by the preceding exsiccation; whereby they make the Patient every day worse.

VIII. Astringents must never be used, till the antecedent matter be well evacuated and derived, otherwise those humours retained run to the more noble parts, and cause grievous symptoms: As *Galen* writes it befell *Boethius* his Wife, whose Belly swelled with the preposterous use of Astringents, the serous humours being retained, which used before to be evacuated. This also must be observed, that while we use Astringents, the antecedent matter may be diverted another way, and the breeding of it hindered.

IX. They do not advise ill who in the Whites order Issues in the Hips and in the inside of the Legs; for so they affirm the Whites are amended, while the serous matter is averted to the crural Veins: They are good, especially if the Disease be inveterate. From *Galen*, 5. *Aph.* 36. it is evident, that among the causes which hinder monthly purgation, this is not the least, when the humours incline some other way than to the womb: like as he said, that some excretions, whether natural, or made by Art, as Ulcers, do make revulsion of and derive the blood from the womb, and transfer it to other parts. The same judgment may be given of vitious humours falling upon the womb. Do not we also know from *Hippocrates*, that making much water in the night signifies that one goes but little to stool?

X. I have observed, in Women that were never before troubled with the Whites, they have followed the taking of a Purge, when Nature by taking one has been excited to other excretions; and that many Women, when they have been bathing, have contracted this Disease, not by Contagion, but because by the constant use of the Bath, as Nature discharges the excrements by Sweat, so also the same by this excretion expels especially what is too thick to be carried off by Sweat.

XI. The Arteries of the Nose, and partly also the Veins, discharge their excrementitious humidities, into the spongy parts about the Nose and Jaws: for these Vessels are divaricated in the flesh of the Nostrils and Jaws, like Spiders-webs, and sweat out a kind of dew, just as water sweats through earthen ware before it is glazed. But how comes it to pass, that many void little or nothing at the Nose? I answer, that very few are found, who are of so happy a temper, as to be void of excrements. This Driness of the Nose and Palate is not so much a sign of a temperate Brain, as of a temperament *ad justitiam*. But they that have a foul blood, and are destitute of this evacuation by Nose and Palate, are not so without damage, but are liable to many inconveniences. *Francis*, King of France, had a dry Nose, but had Ulcers in his Ears. I have known Dames who have been deprived of this ac-

ceptable benefit of the Arteries carrying Phlegm to the Nose, and they have been continually troubled with the Whites.

XII. Some corroboration and exsiccation must be used to the womb at last; for although in the Whites it be not hurt in it self, yet in progress of time it contracts so much harm that the Whites come with the *Menses*, and can scarce be distinguished from them.

XIII. If the Whites be malignant, and the sharp humour exulcerate, be of an ill colour and dangerous, sometimes it proceeds from a virulent, external and contagious cause. And therefore Women must be prudently interrogated about the matter, that they may acknowledge the Disease, and not impose on the Physician under a pretence of the ordinary flux, to their own damage indeed; unless they acknowledge their fault, or lay it upon the Husband, whom we should rather blame, if there be some small suspicion, than blemish the Woman's Chastity.

Medicines especially made use of by eminent Physicians.

1. Twelve Citrull-seeds eaten every morning, and then a draught after them, is a good Medicine for the Whites.

2. The Fume of a Decoction of Shells of Pine-nuts in Vinegar, wherein burnt Marcasites are often quenched, is good.

3. This is daily experienced; A drachm of green *Filipendula* root given in Black-wine. ¶ A Woman cured several in this manner; Take bruised Clary, let it putrefie in Butter; then boil it a little, and keep it. With this Ointment she anointed the Woman's belly from the navel to the *pubes*, putting some of it into the *vulva*, and she ate some of the Herb. ¶ The Ashes of Kernels of Wall-nuts with Wine injected into the womb, stops this flux-wonderfully. ¶ They say this is a Secret; A Fume of Sage stops immoderate *menses* and all Womens fluxes.

4. Tincture of Corals, taken inwardly, is of great virtue, and *Crocus Martis*, if 4 or 6 grains be taken in Plain-water. ¶ Mastic-wood-wine, made by infusion and gentle ebullition, is a singular Remedy for the Whites, drank at meals for several days.

5. This is a very good Powder, wherewith many Noble Women have been cured; Take of the Jaws of a Pike, a Capon's head dried in an Oven, each half an ounce; Date-stones 2 drachms, Coriander-seed prepared, Aniseed toasted, each 1 drachm. Root of Water-lily, half a drachm. Sugar of Roses, 4 ounces. Make a Powder. Take some of it in Red-wine.

6. To discuss the reliques, and dry an oedematous body, nothing is better than a Decoction of *Guaiacum* drunk every day in the morning.

7. I have cured inveterate Whites with a Decoction of 4 or 6 ounces of Oak-leaves, with a drachm of Hares-venet, taken for 8 or 10 days.

8. The distilled Oil of *Daucus creticus* anointed on the *vulva*, after bathing, wonderfully cures the Whites, and heats it again.

 Medicines.

I. I Have seen many accidents from over-late loosening of the Bandage. One in Summer time broke his Arm in the Cubit: The Fracture being loosened, and the Plaster taken off, they found the Arm not onely ulcerated in three places, but so stinking, that there were Maggots, such as are in putrid flesh. The Bandage was taken off the thirteenth day. A decrepit Man broke his Leg a little above the Ankle by a fall from an Horse. The fifth day, when the Fracture was unbound, many livid Pustules, threatening a Gangrene, were observed. A Countrey Man had broke his Foot so, that it separated in the Joint, and was wonderfully contracted; the Bandage and Medicines, through the negligence of them to whom it was committed, not being changed, an Inflammation and Stench arising, the poor Man died. I also, when I had not been so carefull as I should in loosening a certain Noble-man's Fracture, and had not changed the Medicine from the fourteenth till the one and twentieth day, so great a Callus was bred, that a great deformity in the Leg had followed, had I not presently repressed the Callus.

Hildanus, cent. 2. obs. 91.

II. I disapprove of Barks of Trees, made use of now instead of Ferulæ in Fractures of Bones. The Lord N. had a Fracture with a Wound in his Leg by a Fall from his Horse: While I was setting of his Leg, at the persuasion or command of the Patient, instead of ferulæ I applied Green-willow-bark. When the Swathes were loosened, there appeared an impression in the musculous part, not far from the Ham, which imposed on an Emperick, as if there had been another Fracture. I, knowing the Impression and Pitting was occasioned by the Bark, anointed all the Leg and Thigh with Oil of Roses and Myrtles adding a few drops of Vinegar of Roses for Penetration sake, that the humours which were fallen down might be repelled; I rolled also the Leg from the Foot to the Knee with a roller wet in an astringent Decoction. When the rollers were unbound, the next day no inequality, nor any depression appeared. From that time I would never apply Bark of Trees, especially green, instead of ferulæ, for when they dry, they shrink about the Fracture, and sometimes put the Bones out of their place.

Idem, cent. 4. obs. 98.

III. One had the Whirle-bone of his Knee broken a-thwart, so that the parts of it wore drawn upwards and downwards by the Tendons. When the Chirurgion thought it had been well cured, the Patient no sooner stood up, and began to walk, but it parted again into two pieces. For in Luxations and Fractures I have seen Ligaments made shorter, and Tendons contracted, so that the motion has several ways been hurt.

Vellichio.

IV. Vulgar Chirurgions in Fractures, without distinction, do at the very beginning, or within a few days usually apply Emplastrum Oxycroceum to the Fracture, which sometimes is done not without great hazard. A young Man, having broke his Leg, fell into the hands of a Barber-chirurgion; he, having set the Bone, at the first dressing applied a Plaster of Bole Armenick, Barley-flower and the White of an Egg; when he had opened the Leg, the third day, he applied Oxycroceum: The same day it itched, and then grew very painfull. When I was called, some days after, I found the Leg inflamed, full of livid spots, and some infested with a Gangrene. The use therefore of such a Plaster is dangerous, especially in the beginning of Fractures and Dislocations; and so much more dangerous by how much more choleric, hot and full of Cacoehymie the body is. Hereby the part affected is heated, and the humours are drawn to it. Therefore it might very well be called Diabolicum by Vigo, l. 8. c. 16.

Hildanus, cent. 4. obs. 92.

V. I knew a Man forty years old, of a good complexion, to whom for a Fracture of his left Leg a Diet was prescribed of viscous things, as feet, heads and tripes of Cows, Sheep, &c. The Fracture indeed was cured in forty days, but by degrees he fell into a Cachexy; then he had a Jaundice and pains in his Kidneys and other parts, till at last he died of a Dropsie.

Idem, cent. 1. obs. 92.

VI. It is certain, that the Stone Osteocolla is endued with a singular virtue of breeding Callus: Wherefore I dare give it to all People in Fractures. But we must be carefull, how we use it in old Men, or extenuated persons, or such as have their innate heat but weak. A Nobleman, fourteen years of Age, who was lusty and sanguine, had both the Bones broken at the Ankle: I set the Fracture very well, I gave Osteocolla inward and applied it outwardly, the third, seventh, eleventh and fourteenth day; when I opened it, no excrecence or deformity of a Callus appeared, but on the twentieth, when I opened it, I found a Callus, especially upon the ridge of the Tibia, so great and high, that a perpetual deformity had followed, had I not immediately left off the use of Osteocolla.

Idem, cent. 1. obs. 90.

VII. That which is found out of the Earth is of no worth, but that which is found in the bowels of the Earth is very good; though, whether you look on the colour or shape, you will scarce find any difference: And therefore many that are sold about, though they be not adulterated, yet they are of no virtue. As soon as it is digged up, it is softer, friable, and of a brown colour when it has been exposed onely a day or two to the Air, it grows hard and white by degrees.

Idem, cent. 3. obs. 90.

VIII. A Woman thirty years old, seven months gone with Child, had her Leg broke in the middle by a Kick of a Horse. The Fracture was well set, but we had much difficulty to breed a Callus, so that in twenty three weeks the Bones were not firm. We gave her Osteocolla inwardly (a thing so famous for broken Bones) and applied it to the Fracture, but to no purpose; at length between the three and twentieth and the thirtieth week a Callus was bred, and the Fracture was knit. The reason why Callus breeds so slowly is, in my opinion, the Child, which draws to its nourishment what should go to the breeding of Callus. Besides, the innate heat being deficient in the part affected, Nature was not able to bring Osteocolla and other Medicines out of power into act.

Idem, cent. 5. obs. 87.

IX. Some foolishly advise, that Fractures which were not well set, and are already knit with a Callus, should be broken again, where the Callus is, it being first mollified with Fomentations and Laxatives. But if some space of time has past, and if it be confirmed and grown hard, the Bone near the Callus will break sooner than the Callus itself.

X. The Knee-pan broken or displaced brings no small inconvenience, without the Fastness whereof, the

the Knee flies out, like a door when the hinges are broken. At least the Knee-pan serves instead of a stay, to help one in going up-hill, or down-hill; of which N. complained, being hurt by a fall, wherein he broke his Knee-pan, and when in several Months it would not knit, and he came to me for help, I told him there was no other way, but to open the Skin, and rub the edges of the broken pieces of bone, and then to bind them up fast, to knit, and let them be kept bound a sufficient time. Which way of cure I found successfull in N. whose cheek-bone had been broken by a shot, and had grown on a lump.

Severinus.

XI. Some Chirurgeons commit no small error in curing broken Legs, when they will have a Man keep his Leg upright on his Heel, whereby, in process of time, more pain is felt in the Heel, than in the fracture it self, and that because of great and nervous tendons, which are inserted in the Heel: And this pain draws much humours to it, which are retained in the joint, and among the broken bones and ligaments of the foot. And because by this site the Veins and Arteries are compressed, and therefore the part affected, is, in some measure deprived of its heat, these humours must of necessity be condensed, and grow cool in the joint, and spaces between the bones of the Feet. Therefore, when the fracture is cured, the Foot is affected with a new trouble; for the joint can scarce be stirred without much difficulty, and sometimes other very bad Symptoms do follow. When therefore the Leg is rolled up with Rollers, *Splenis* and Stupes, and placed in a *Capsula*, or Case, fit for the purpose, such a posture must be chosen, as is least painfull. Wherefore the Leg must be laid sometimes this way, sometimes that, so that the Patient may lay himself sometimes on one side, sometimes on the other: For so, many accidents will be avoided.

Hildanus, cent. 1. obs. 93.

XII. We must have a care in the use of Plasters against a Fracture, that they be not so tenacious and sticking altogether in Children, and Women, as in others. Certainly, upon this score, *Emplastrum contra Fracturam Wirtzii*, of Root of Meadow-sweet is very commendable.

Wedelius.

XIII. But we must have a care in these very strong things, lest they, or bandage upon them, should gird the limb too strait, and so bring an universal Gangrene, as I have often observed. Therefore carefull Chirurgeons advise, the leaving some room free in binding of these fractures; the reason is, that the Vessels, Veins and Arteries, which could not chuse but be wrested in the confusion, may not be straitened together, and hereby the way being stoppt to the Blood and Spirits, be forced to conspire to the destruction of the part.

Idem.

Medicines especially made use of by eminent Physicians.

1. Take of Root of Comfrey, Leaves of Flixweed, bruise them and boil them. Apply them, they cure any fracture.

Paracelsus.

2. I do solemnly protest, that Meadow-sweet mixt in Plasters has wrought admirable effects in a

Simon Pauli.

fracture of the Arm, which was almost incurable.

3. For breeding a *Callus* many do commend the Stone *Osteocolla* in powder, a drachm whereof is often given in Comfrey water: But it is better in Sennert grown than in young people, because in these it increases *Callus* too much.

Fulmen, or Thunder.

The Contents.

The Cure of one that is Thunder-struck. I.

If there be a fracture of the bones, What must be done? II.

How the Eschar may be removed? III.

I. IN June, Anno 1671. A Maid 15 years old was struck down with Thunder in the house, as it were stoned, they in the house treated her as if she had been dead. She was laid upon a bed and stript, and first of all, all one Breast was red, intermixt with some blackness, as if she had been burnt with Gunpowder. Under her breast there were brownish streaks pointing transverse her Belly to the Pubes, which was deprived of hair; and excoriated; and there were some streaks on her left thigh. There was at hand some Apoplectick water, two spoonfulls whereof I poured into her, upon which she presently came to her self, and answered well to what was asked her. She complained of a great heat in her Throat, and of a pain in the part that was hurt. Half a drachm of *Pulvis Bezoarticus Anglicus* was presently given her in Chervil-water; after which she sweat well, and the heat in her Throat abated. Then an Ointment of Cream and White-lead was applied to the hurt place, whereby she found much ease: But because she continued something feverish, eight ounces of an Emulsion was given her, made of Seeds of White-popy, Columbine, Miller, and *Cardus Benedictus*, with 2 drachms of *Pulvis Bezoarticus Anglicus*, after which she was well, and the Fever ceased. The Cuticle was restored to the excoriated Breast by my *Emplastrum Diasaturni*.

Ab Herman. nus, mis. cur. an. 72. obs. 182.

II. If any bones be broke, the vulgar astringent Cataplasms must not be used, lest the evaporation of the venome be hindred, but another of Bean-flower, Lupines, Root of *Angelica*, Swallow-wort, Leaves of Rue, *Scordium*, Treacle; and it must be renewed every day, till the strength of the venome be conquered and dissipated. But a defensive must be applied above the place, lest the venomous vapours ascend by the Vessels to the Heart.

Sennertus

III. If an Eschar be made, it must be timely taken off with a Pen-knife, and such an Unguent applied; Take of powder of the Root of Swallow-wort, *Angelica*, each half an ounce, Leaves of Rue, *Scordium*, each 1 drachm, Treacle 2 drachms, Spirit of Treacle 3 drachms, Honey of Roses 2 drachms. Mix them. When the Ulcer is cleansed, this Sarcotick powder must be srowed on it; Take of Root of *Angelica*, Swallow-wort, each 1 ounce, Myrrhe, Mastich, Frankincense, Leaves of *Scordium*, each half an ounce, *Aloe Socotrina* 2 drachms; make a Powder, which must be wet with juice of true Tabacco and Sanicle. Make *Trochiscs*.

Herb.

A GUIDE TO The Practical Physician.

BOOK VII.

Of Diseases beginning with the Letter G.

Gangraena, Sphacelus, or, Gangrene, Mortification.

The Contents.

Defensatives are not proper in every one. I.
The prevention of one imminent, according to Hippocrates. II.
Narcoticks must be cautiously applied to parts, where it is imminent. III.
Oily and fat things suspected. IV.
Arsenic is not proper. V.
An Actual Caustery, though safer than a Potential one, cannot always be used. VI.
When it arises from an internal cause, it scarce admits of a Cure. VII.
The Cure of one imminent from a Puncture. VIII.
Of one bred of a malignant Inflammation. IX.
There is no curing of a Gangrene after a Fever. X.
The taking away of a Gangrene by Causticks. XI.
Mortified places require not only the taking away of the skin, but of the flesh also. XII.
If the strength will not bear Amputation, what must be done? XIII.
The Leg must be cut off near the Knee. XIV.
We must not be too hasty in Amputation. XV.
Sometimes it is useless. XVI.
Whether it may be made in a Joint? XVII.
By a Knife, and Botallus his way, not to be allowed of. XVIII.
Whether it must be made in the dead or live part? XIX.
The Body must be first prepared. XX.
Whether Narcoticks may be given? XXI.
After the operation, the Patient must be carefully looked after. XXII.
How a Hemorrhagy following may be stopt? XXIII.
The Bandage on the upper part, when Amputation is made, must be removed. XXIV.

The part must not be wrapt up too warm. XXV.
How abscission of the middle and ring finger may be performed? XXVI.
Cautions about cutting off a hand, affected with a Cancer, not ulcerous. XXVII.
Medicines.

I. IN a Gangrene from afflux of blood and humours, as long as the fluxion continues, Defensatives are good. When it ceases, they may be omitted; that the innate heat may reach to the part affected. But if any beginning of corruption shew it self, we must proceed in the use of them, that the way may be stopt to Vapours, that are raised from putrefaction, and which go to the noble parts. In a Gangrene bred of a cold and moist intemperature, where no fluxion is, they are not proper, unless a mortification be at hand, to stop the Vapours. A Gangrene that is the product of a dry intemperature, and want of aliment, plainly excludes Defensatives; for they, by their astringion, straiten and stop the ways of the Spirits and of Nutrition. But if a mortification be at hand, they should not be rejected, that the coming of Vapours to the principal parts may be prevented. However, if it owe its original to a malignant matter bred in the body, and driven outwards, there is no room for them.

II. Whatever parts are taken with a Sphacelus, we must intercept the Vein, exulcerate and heal, Hipp. sect. 5. l. 2. Epid. That is, It can no otherwise be cured, than by intercepting a Vein and exulcerating a part. And he says, a Vein is intercepted, when that or those Veins, which carry blood to the gangrened part, are cut off in their way by cutting, burning or tying. By exulcerating he means deep scarification of the part. Therefore, when signs of a Gangrene begin to appear in a part, we must quickly make

make provision for the whole; and if any Vein seem swelled and black, it must be intercepted with a Cautey; and we must ulcerate the parts, that are then dying, with deep scarifications, or burn them; or partly exulcerate them, and apply eating Medicines to them, and partly burn them: But any thing less than these is useless in this Disease.

III. Narcoticks must not be applied, except in a little quantity and something corrected with hot things, to parts that are indisposed, swelled, and that are of an ill habit, or ready to gangrene, because of Incision made in them, or for any other reason, through excessive pain with Inflammation: For by violating the heat, that is but weak in the part affected, they promote a Gangrene, and at length an Inflammation.

IV. *De Vigo* adds Oil of Roses, Chamæmil and Spike to Plasters. But oily and fat things doe harm, by obstructing the Pores and hindring Perspiration.

¶ Abstain from Digestives, that *Pus* and Putrefaction may be resisted; though *Hildanus* uses his digestive Ointment, made with Oil of Roses, in a Gangrene speedily spreading all over the body.

V. Arsenick neither alone in Powder, as *Fallopian* teaches, nor mixt with *Unguentum Egyptiacum*, can safely be applied in a Gangrene: For *Galen* reckons it among things septicke, and such as have a burning faculty. Hear what *Avicenna* says, "It is a putrefactive Medicine, whose property it is, to corrupt the complexion of the spirit, which comes to the part, and the complexion of the moisture of that part with resolution, so as they are not proper to assimilate to the part. Indeed it proceeds not so far, as to burn it, and corrode and waste its moisture; but it leaves a corrupt moisture in it, in which it acts contrary to the natural moisture, wherefore it putrefies." And this is an instance for Arsenick. Now because a Gangrene is the beginning of Putrefaction, in the heat and moisture, things that act by such a quality, cannot be a Remedy. But if we must come to potential Cauteyries, use such as are made of a strong Lixivium of Vine ashes, and quick Lime. These ruptorie Medicines operate safely and quickly, and with little pain, scarce continuing for an hour: On the contrary, Arsenick torments a Man twenty four hours, yea, two days, with most grievous Symptoms.

VI. An actual Cautey, that is, a red hot Iron, is preferred in dignity to a potential one: 1. Because the action of the Fire is simple, void of all aliene quality, leaving onely an *Empyreuma* behind: In a potential one, especially in Arsenick, &c. there is a malignant quality. 2. The action of Fire is determined: but not of a potential Cautey. 3. Because of the efficacy of the Fire, it operates in a moment: A potential one slowly, wherefore in a Gangrene, which is an acute Disease, it is not proper. 4. In a Gangrene there is plenty of excrementitious humours, requiring a Medicine hot in the highest degree, such as a red hot Iron: But Arsenick, though it be hot, leaves a corruptive humidity after it, as *Avicenna* says. 5. The part labouring of a Gangrene, being weak and lax, requires a Strengthner and Dryer, wherein an actual Cautey excels. But not a potential one. 6. The operation of a potential one is slow and painfull, hence comes an afflux of humours: The pain caused by an actual one is momentary. It is condemned by *Vitruvius*, for this onely reason, because the Nerves are hurt and contracted by an actual Cautey: But an experienced Chirurgion will not commit such an error, who knows the difference between Nerves, Veins and Arteries: for these lye near the Skin, the Nerves lye deep. But though there were danger of some contraction, yet this should be preferred before certain Death. Yet in bilious Inflammations, which are hot and dry by

nature we must use an actual Cautey carefully, and never but on urgent occasions, for by an actual Cautey they are made more dry, and grow more malignant: But if Putrefaction come to such a height, and if the plenty of humours be drawn by the violence of the Pain, actual Cauteyries may be made use of. They are condemned also in a Gangrene, from an hot intemperature without fluxion, and in one that comes from drinels and want of Aliment; for great extenuation and drinels admits not of a drying Medicine, nor must it be used, unless Amputation of the Limb be necessary.

VII. Gangrenes, produced by an outward Inflammation or Refrigeration, are far more easily extinguished and cured, than when some venom bred in the body has been the spontaneous cause of them: For in these the humour never lies so much on the out parts either of it self, or forced thither by the strength of Nature, but it always leaves some root and infection of its malignity in the Vessels. The Knife will doe little good in them; for although after Amputation you strive to extinguish the reliques of the venom with Alexipharmacks, yet perhaps you may doe it to no purpose; because there is such a kind and individual propriety of venom latent in these cases. I think Fire ought to be preferred before the Knife in such a case. Yet if it happen, that the venomous matter be driven out by a strong Nature to any particular part, in this case Amputation is a safe Remedy. A thing, which I once observed at *Newenburgh*, in a young Maid, who, upon the coming out of the Small Pox, being sent by her hard-hearted Mistress to gather something in a Vineyard, in a cold season, her little finger of her right hand was gangrened the same day, and happily cut off, without any Symptome supervening. The event was far different, *An. 1675.* in the month of *August*, in a Boy eight years old, the Son of a Garrison Souldier, who being ill cured of the Small-pox, the venomous matter fell upon his Mouth, that is, his Tongue, Jaw and left Cheek; and a Mortification arising, his Teeth on that side fell out, and he died the fourth day.

VIII. As a Bridegroom and Bride were playing one with the other, she threw a Handkerchief with a Pin in it at her Husband, who was lean, and had very broad Veins, and she hit him so, that the Handkerchief hung by the Pin, which stuck into his hand. Within a few hours not onely a great pain arose, but his left hand was so much swelled, that the next day he went to a Chirurgion, who being affrighted at the violence of the dangerous and unusual Symptoms, desired that he might have me for his Adviser, and that I would join with him. I feel the Patient's hand, there was no mark of the prick of any Pin, all his hand to his very wrist being stiff and inflexible. I ask him, if he remembered in what part of his hand particularly he was prickt, and with his forefinger of his right hand he shewed me the place or region where the third bone of the *Metacarpium* bears up or sustains the ring-finger; which being very much swelled, when I tried to bend or extend it, good God, how he roared! In the mean time methought I saw a little mark of a Pin, like one of *Democritus* his Atoms, and indeed in that part of the hand where the ring-finger and the said bone of the *Metacarpium* are articulated; yet not in the very joint, but a little below it, whereabouts the bone and its *epiphysis* are joined together. All this time there was no sign of extravasated blood, but some discolouring, livid or rather a strange fugacious colour. Here was need of Advice and of present Remedy against an evil that threatened a Gangrene. Wherefore my Advice was this, that it was not convenient in this case to use Oil of Scorpions and such things, which some who were by did urge, but after large Bleeding (for the Patient was feverish and had large Veins) having forbid him all fat things, I ordered him a

lib. 32.

Decoction partly anodyne, partly discutient, partly gratefull to the nervous parts, made of equal parts of French-wine and Wine-vinegar, of Flowers of Elder, and common odoriferous Chamæmil, with equal parts of Castor and Myrrhe, and a little Camphire, in which, being well strained and squeezed out, linen Cloths were wet and wrapt warm about the hand: After the use of which Fomentation, in the night following, all the Symptoms abated; and thus was an imminent Gangrene kept off.

Vallesius,
5. Epist.

IX. In malignant Inflammations and Gangrenes we must not expect late help onely from Remedies called Universals, although these ought to go before Topicks: but we must proceed immediately to cutting, burning and the greatest drying. Besides, we must consider, whether the matter be poisonous, for then we must abstain from purging, which might draw towards the Heart, unless it abound much in the body. And we must use Bleeding, which they that are so affected may endure, and Diaphoreticks, which must also be alexipharmack, and then we must endeavour to extirpate the Putrefaction in the part with the Knife, Fire and drying Medicines. For by this means, in time of Pestilence, many are saved.

Tulpius,
l. 3. obs. 48.

X. A. about seventy years old, was violently parched by a burning Fever, and the pestilential humour of the Disease poured it self with such violence into her left Arm, that in one night it was cast into an incurable Sphacelus from the setting of it on at the shoulder to the fingers ends. Do not therefore, O Chirurgion! inconsiderately cut such Arms, endeavouring either to recall the heat into the skin, or to make way for Medicines; for what is once mortified, can never be brought to life again. And although the Disease may sometimes seem to be at a stand, and to require the Pen-knife, yet the Strength being spent by the malignant Fever, and the part wholly spoiled, do not permit either the cutting or the cutting off a Limb infected in this manner. You might indeed hasten Death, but in the mean time you can doe the Patient no good. It were better therefore circumspectly to preface Death, and to prorogue it as long as you can, than to endeavour the saving of Life, when you are not able to doe it.

Fallopianus

XI. Some scarifie the dead flesh near the sound to the very bone, afterwards they strew Powder of Arsenick or Sublimate on the Wound: Or they put in Unguentum Egyptiacum fortified with Arsenick, that the dead part may be separated from the sound. But it is well known, what dire, and oftentimes dangerous Symptoms, Arsenick and Sublimate do sometimes cause, and therefore not to be used in the Cure of this Disease. Others burn what is corrupt with an actual Caustery till the Part feel pain: but how dangerous also this Caustization is, Fallopianus does shew. Others make Amputation of what is corrupt by Section, and that either with a Razor or a Saw, or a Modiolus, or a Hatchet: But how violent and cruel this operation is, (and therefore unbecoming a rational Chirurgion) and how destructive to the Sick, because of the great Symptoms which follow it, Hildanus, de Gan. & Sphacel. cap. 17. does shew. Instead hereof, ruptory Medicines, made of Vine-ashes and Quick-lime, do please me better. Butter of Antimony and Oil of Quick-lime are also as good: for they make a deep Eschar presently, and almost without any pain; and because they are endued with no malignant quality, they do not at all hurt the principal parts, as Arsenick does. And these must be applied near the sound part of the flesh, nor is scarification of the flesh necessary, for they are strong enough, and penetrate deep enough of themselves. But when the Eschar is made, we must not tarry for the falling of it, by the help of Nature or Medicines, but it must be removed or separated with a Razor, or some other proper Instrument.

Frid. Hofmannus, m.
m. l. 2. c. 2.

XII. Some now-a-days use to treat mortified Places slightly, as if they were simple Gatherings or Abscesses; which if they prick but in one place, so that the humour runs out a little, it serves their turns, and they will have this prevent all dangers, so that they engage, the Man will doe well. But I would have Mortifications treated with Excision, to the sound parts, which some either neglect or do not take notice of.

Severinus,
Med. off.
p. 112.

XIII. One broke both the bones of his right Leg in the middle, with a Wound, bleeding till he fainted, a Sphacelus supervening. The most Excellent Petrus de Marchettis, because of his weakness through excessive bleeding, would not cut it off; but by often applying red hot Irons he hindered the Putrefaction from spreading farther; in the mean time he took care of the Heart. At length, the Patient not knowing of it, he cut the dead part with a Razor, near the live part round about, which falling off, he consumed the rest of the Putrefaction with actual Causteries. To remove the Eschar he applied Unguentum Egyptiacum simplex. The Chirurgion, on the third day after he had cut his Patient, when he was complaining of a great Pain in the great Toe of his right Foot, smiled upon him, and told him, he wondred he should complain of a Pain in his great Toe; that had been buried three days. At which words the Patient was so terrified, that he fell into a Swoon. The Eschar being taken away, and the Muscles, after the usual manner, retracted upwards, the broken bones stood out four inches, which being every day covered with dry thread and a catagmatick Powder, were separated in two months time from the sound. Hence we may gather, that if the Patient's strength be so low, by reason of putrid Vapours, and an antecedent Flux of blood, that we are certain he would dye in the very Operation, then we must abstain from Cutting, because it is more excusable to leave the Patient, than knowingly to kill him. But if there be no hope of life, unless the part be separated, it is the Chirurgion's duty every day to touch the mortified part morning and evening with red hot Irons, that the putrid humours may be dried up, lest the Gangrene creep upwards, and he must give Cordials.

Scultetus,
Tab. 54.

XIV. If the Gangrene be above the Ankles, the Leg must be taken off near the Knee, for what is left is of no use; yea, it brings much inconvenience to the Patient, when he must use a wooden Leg, for the part hangs idle behind; besides, when it is cut in the tendinous part of the Muscles and fleshless part of the Leg, it makes the healing far more difficult. ¶ Section must be made in the sound flesh, yet near the mortified, about an inch from it, because we are not certain, that what is left will not multiply it self; yea, we must not trust the bone it self, which is under the flesh, that it is not corrupted in an higher place.

Van Horne,

XV. Yeast, which is taken off Beer five or six hours after it is warm, stops a Gangrene, according to the experiment of a Dutch Woman, who restored the natural colour to a Baker's Leg, which should have been cut off the next day, by applying Yeast on a Cloth to it, to the admiration of the Chirurgions; and by continuing the use of it for some days, she preserved the poor Man from all danger. I saw a Gangrene imminent from cold cured in our own Maid by Yeast of strong Beer. One had a Gangrene a whole night, and Amputation was resolved on. An Emperick coming in, fomented the part all night till the next day in Water, wherein Lime and white Chalk had been boiled. The next morning the Gangrene appeared quite taken away. ¶ Another Man was to have his Leg cut off for a Gangrene, after violent Pain and Inflammation. At the Persuasion of a Country-man he covered his whole Leg in wet Sand, it was often renewed, and the Patient was so relieved, that when the

T. Bartholinus, cent. 5.
hist. 41.

Riverius.

the Chirurgeons came, they found him cured. ¶ One had most grievous pains in his Leg, and it came to that pass, that the Skin grew black, so that it began to be gangrened, and the Physicians were considering about cutting it off: at length a Priest came in, and bathed the whole Leg, especially the place where it was black, with *Elizir*, or *Aqua vite Juliani*, and strewed upon it an equal part of powder of Myrrh and Aloes; and applied a Linen cloth wet in the said *Elizir* and powders, binding it with a broad Rowler. The Pain ceased, and in the part that was black, an Ulcer grew, out of which many pieces of bones were taken, and it was cured with these Medicines, though he drank Wine all the time of his cure. ¶ A Woman, after a tedious Disease, had a Gangrene in her Leg, which while it was yet beginning, was wholly taken away by a long fomentation with a vulnerary decoction of *Aristolochia rotunda*, *Rhaponticum*, Zedoary, Myrrh, Aloes and white Wine, adding to the colature *Aqua vite*, wherein Camphire was dissolved.

XVI. I have seen some, whose whole Limbs were corrupted in a Malignant Fever, whose condition was deplorable. If they were not cut, corruption quickly seized the other parts: If they were cut, it was Butchery, and they died afterwards. It is better to leave such uncured.

XVII. In this sort of *Aphæresis* we must take care, above all things, of the place of amputation. Many of the Moderns determine, this is convenient enough in the very joint, although in common practice almost every where the contrary is observed; both for the difficulty which occurs in the very section; for the place of the conjunction of two Bones cannot so readily be found; and because it cicatrizes very slowly, and with much difficulty.

XVIII. I would advise rational and faithfull Chirurgeons, in cutting off Hands and Fingers not to follow them (unless upon urgent necessity, as shall be said hereafter,) who place the Limb on a Bench, and applying a Knife or Ax, with the blow of a Hammer chop off flesh and Bones both at once. This operation is violent and cruel, unworthy of a Chirurgeon, and destructive to the Patient: For not onely the nervous and muscular parts are confused and mangled above measure in this operation, but also the Bones themselves are usually cloven to the very next articulation. Hence, though Bones have no sense, yet by reason of the *Periosteum*, most grievous pains, and other Symptoms, yea, and a new Gangrene will arise. Which things though all of them do not supervene; yet the Ulcer is not brought to a Cicatrice without extreme difficulty, because of the shivering and great contrition of the bones, which remain here and there in the muscular flesh, and stick for a time to the *Periosteum*: yet at length they are cast out by Nature by degrees. From these things it is manifest, how inept and dangerous the way of cutting off Limbs is, which *Leonardus Botallus l. de vulneribus Scelopetorum* propounds. Make two wooden Columns, says he, fix them in a ponderous joint, and let them be made hollow on the inside lengthway, each of them; in the lower side fix a broad Knife firmly, with its edge upwards; and let the moveable part have a Knife fastned in it with the edge the contrary way: When a Limb is to be cut off, the upper part loaden with Lead must be let fall from on high, or forced with a heavy blow, and it cuts off the Limb, flesh and bone at once. I saw an instance of ill success in a young man, who, when his hand was shattered with a Gunshot, committed himself to a Chirurgeon. The Chirurgeon laid his hand on a Bench, and set an Ax, wherewith Country men cleave wood, upon the part where the hand was to be cut off. Then he commanded the head of the Ax to be struck with a violent blow of a wooden Maul. The Hand indeed was cut off at one blow, and there came no grievous Symptoms at the beginning; but it was a long time, and

he was put to much pain before he was well: It was very difficult to close the Ulcer with a Cicatrice, because of abundance of broken and shattered bones, which created monthly troubles and new Symptoms to the Patient.

XIX. *G. Fabricius Hildanus* in his most learned tract *de Gangrena & Sphacelo*, c. 17. endeavours to prove by many reasons and authorities, that the dead part cannot quickly, safely and pleasantly be cut off, if any of the putrid part be left, to be washed with red hot Irons: Yet these reasons in my judgment do not convince, that amputation of a gangrened Limb, *Aquapendent's* way, does never succeed well, much less do they demonstrate that this way of *Aquapendent's* is worse than that which according to the Ancients is made in the live parts, considering that amputation of a gangrened Member cannot be pleasantly made in a sound place, whether the parts softer than the bone be cut with a Razor, or with a cauterizing Knife. Nor can it be done safely, because the sound and live part tied very strait, may easily dye. Yea, Section cannot be made in a sound part so carefully, but that sometimes the parts that are deeper and farther corrupted (than the external parts visible to the Eye) will be left. Which if it be done, either new Section must be made (which were horrible) or the reliques must be burnt with red hot Irons, *Aquapendent's* way. Not quickly, because a longer time is required to draw out the Arteries with Pliers, and tie them with thread, (and if the swathes be removed, sometimes such a Flux of blood follows, that unless the rest of the vessels be touched with an actual Cautery, it cannot be stoppt) than to burn the wound presently with actual Cauteries. Not to say, that the Operation is farther protracted, if after resection *Hildanus* and the Ancients way, any putrefaction remain, to be consumed with the said Cauteries. Wherefore being persuaded with these Reasons, and having had good experience of it, I reckon the cutting off of a mortified part according to *Padua* and *Aquapendent's* way (which is approved by *P. Salmuth. cent. 1. obs. 80.*) does not onely not come behind the old way of cutting, but should rather be preferred before the old.

XX. One was to have his Leg cut off, and the Chirurgeon was ready to doe his work; I dissuaded it, because the Body had not been prepared before. I would not be present at the operation, lest I should have seemed to have consented. Therefore I absent my self, and they cut off the Limb, and, as they think, doe the business well. Some Students came to me, who were there, and tell me the operation succeeded well. I bid them mark the third or fourth day. The third day in the morning the bands, through the violent force of the blood, were broken, and the vessels opened: And before the Chirurgeon could stop the bleeding, the Patient poured out his Life with his Blood.

XXI. Some before the operation give the Patient some Narcotick, that he may be less sensible of the pain. But we, according to *Guido's* Opinion, will abstain, because of the dangers that attend Narcotics. ¶ Some before the Amputation of a Limb, always give *Philonium Persicum*, for fear of an hæmorrhagy; and with success indeed, because it is a Narcotick: But it is known that *Philonium* does good onely for one day. Therefore it should be taken every day, which would be very detrimental. But it is best, according to *Hippocrates* his advice, to breathe a vein the third or fourth day.

XXII. Here I would advise young Chirurgeons, that while the Patient sleeps, a servant should watch with him continually, lest the Patient through false Imaginations, which sometimes come into his head, should move his Stump, and the Blood should burst out again. Which happened to one whose Arm I had cut off at the Elbow: He on the third day, in my absence, would reach out his Arm (which he thought

Hildanus de Gang. & Sphac. c. 17.

Salmuth. Cent. 1. obs. 80.

Hildanus de Gang. c. 19.

Salmuth. ibid.

Hildanus. was not cut off) to take something; a vein opened, and a violent Hæmorrhage followed, which killed him within a few days.

XXIII. After amputation is made, if the Hæmorrhage be great, (which yet, if a strong ligature be made, rarely happens; so that sometimes only a few spoonfulls come, or not above three or four ounces at most) some use an actual Caustery, to burn the vessels, and to make a crust on the Flesh. But it is to be feared, that when the crust falls off, a new Flux of blood may come, and before the Chirurgion can be called to stop it, the Patient may depart. Besides, *Paræus, lib. 12. cap. 35.* affirms, that great Pain and Convulsions are raised in this manner. Wherefore *cap. 31, and 33.* he advises to take hold of the vessels with Pliers to run a needle through them, and tie them fast with a thread. But *Gourmelinus, Syntagm. Artis Chirurg. p. 125.* for very good reason disapproves of this way: As we also do, with *Hildanus*, reject the method described by *Paræus, c. 32.* When he draws the flaps of the Skin together by running a needle and thread in 4 places, and drawing them together, and thus endeavours to cover the bone, that it may not be injured by the external Air. For what need is there to torment the Patient with such injuries, which will do no good? The cure is far more happily performed, if we make use of the fuz-ball, called *Crepitus Lupi*. That is, in the space betwixt the two bones we must apply pieces of it, full of Powders that stop blood, wet in Whites of Eggs; Yea, we may make of it scouped out, a kind of dish, and fill it with a stegnotick Powder, whereinto we may put the end of the Stump. Which dressing may be kept on by a defensive and glutinant Plaster, over all which a Beef's bladder may be applied (till the fear of Hæmorrhage be over) and at length a cruciate swathing may be made. ¶ In the mean time the heat of the blood must be stopt by *Laudanum Opiatum*. ¶ One was condemned to die, and when the Hangman, before he cut him into quarters, had cut off both his hands in the street where the House stood, in which he had done the villany, lest he should die of the large bleeding, he was by this means preserved from sudden Death. The Hangman's Wife took a live Cock, and opened it from the vent to the Breast-bone, and immediately thrust the stump into it, and then folding the Wings, tied it fast with a cord, and thus the violence of the Blood was stopt, so that it bled not for above an hour; and till he was executed, the Malefactor was no weaker for his dismembring. ¶ When a Horse had bit a Man's Finger off, and the blood, after several ways had been tried, could not be stopt, I ordered him to thrust the wound into a Chicken cut open near the vent, and to hold it there till it was cold; and the bleeding immediately stopt.

XXIV. Some Chirurgions use to leave the bandage on the upper part of the amputation till the second dressing, that the mouths of the vessels may be stopt, but they doe very ill: for it causes grievous and continual pain: Hence come Inflammations, Fevers, want of sleep, &c. For Pain draws the blood and humours violently to the part. For this reason, the first dressing, if it can any way be done, must be removed within two or three days at farthest. For the Swathes and Bladders, when they grow hard, cause pain.

XXV. Some at the beginning do so wrap up the stump in linen and flanel, that thereby to the Patient's great damage, it grows hot, and so draws the blood and humours thither.

XXVI. In abscission of the middle or ring Finger, if the corruption or Caries go so far, that abscission must necessarily be made at the third articulation or the *Os postbrachiale*, no small difficulty has hitherto arisen; and that because of the *Septum Digitorum*, (that is, that fleshy part, which lies between the

third and last joint of the Finger, towards the second joint (as you may see in *Fig. 2. c. 25. l. 1. Vesalii*, from the letter R. to D.) for the cutting of the Knife or Razor must be thrice repeated: The first Cut separates the finger in the last joint from the *metacarpus*; the second and third takes off the *Septum Digitorum* on either side of the finger. In this operation thrice repeated something carnosus or membranous may remain untouched by the Knife, and may render the operation more difficult and tedious. Now I, considering these things, contrived an Instrument whereby the finger may be cut off in the last joint, together with the *Septum* on either side, at one blow; and it is a very sharp and winged Knife, whose hind part is semicircular, and of a bigness proportionable to the finger to be cut off. And though before I disapproved of this way of chopping off Limbs, yet in this case, because it cannot otherwise be well done, of two evils we must chuse the less.

XXVII. A Hand affected with a Cancer not exulcerated is cut off in a sound place, that is, at the heads of the *radius* and *ulna* towards the Wrist. But we must take notice, to the end the blood yet infected, which the adjoining Vessels contain, may run out (for being retained it might affect the Arm) that neither the Arm must be tied with a rowler, above the place of Incision, nor must the foster parts be cut with a red hot Knife, which *Barbari. Scultetus.* call *Cauterium cultellare*.

Medicines especially made use of by eminent Physicians.

1. I have often seen this Cataplasim used with desired success in stopping of a Gangrene; Take of Meal of Beans, Lupines, each 4 ounces, Juice of Rue 2 ounces, or Powder of Rue 3 ounces. *Ozymel simplex* 6 ounces, Lie what is sufficient. Sometimes he adds powder of *Scordium*. Mix them. Make a Crato. Cataplasim.

2. Spirit of Salt, rightly prepared, applied to outward Gangrenes and Ulcers, is a high Narcotick Remedy without any pain. ¶ All the care consists in the efficacy and virtue of Spirit of Salt; for the Salt being saturated with this Liqueur, and dried, is reduced to its natural temper, which every one may see by experience; for every sharp and biting Salt, if it be dissolved in Spirit of Salt, is reduced to a wonderfull sweetness.

3. *Unguentum Egyptiacum* is a most excellent and principal Remedy for a Gangrene; it separates the dead flesh from the live, and breeds a laudable Eschar. *Gul. Fabri. cius.*

4. In the cure of a Gangrene, after the Eschar is removed, if not only Medicines, but the very Air, cause intolerable pain, this following is very familiar with me. I take Ointment of Betony made of the juice, to which I either add Oil of Sweet Almonds, if there be no inflammation, or if there be one, as there often is, I mix Oil of Roses or Yelks of Eggs, and I have never yet found any thing better. ¶ *Scordium* bruised, or the juice of it, is excellent: For experience shews, that dead bodies are preserved from putrefaction, if they either be stuffed with it, or wrapt in it. *Hieron. Fabricius.*

5. Take of Colts-foot 1 handfull and an half, Melilot, Mullein, Dwarf-Elder, each half an handfull. Frankincense, Litharge, each 2 drachms and an half, Mastick, Myrrh, each 1 drachm and an half, crude Alume 2 drachms. Mix them for a Decoction. When a Gangrene is feared in a Drop-Grembs, sic.

6. Let the part affected be washed with Spirit of Wine Camphorate, than which I think nothing is more proper for hindring the mortification of any Part.

7. I re-

7. I remember one was perfectly cured of a Gangrene in his thigh, after rotten Apples bruised had been applied in form of a Cataplasm, without the liquor, once or twice.

S. Pauli.

8. To bring a place to its natural colour again, Unguentum Egyptiacum, dissolved in Aqua vitæ, is most excellent.

Ranchinus.

9. I order the scarified places to be moistened with Spirit of Sulphur, where the flesh was mortified, then I order all the Arm to be fomented with Spirit of Wine hot, wherein Powder of Aloes and Myrrh were infused; then Powder of Aloes and Myrrh were strewed on the Arm in great quantity, and upon the Powder linen cloths, wet in Spirit of Wine, were applied, which Remedy being used a few hours, the Arm returned to its colour, to a miracle; the swelling abated, and the Gangrene was stopt.

Riverius.

10. Take of Cow's dung 1 pound, Oil of Roses 4 ounces, Vinegar 3 ounces, Saffron half a scruple. Mix them. Make a Plaster, which must be applied hot every three hours, I know by experience, it certainly cleanses and cures a Gangrene.

J. Dav. Ru-landus.

11. To prevent a Gangrene Sir Theodore de Mayerne of England used this following successfully, applied warm with cloths dipt in it: Take of the strongest Vinegar, red Wine, Spring-water, each a like quantity, Litharge of Gold well beaten 8 ounces, Roche Alum, Sea Salt, each 2 ounces, Gum Arabick, Myrrh, each 1 ounce, Olibanum, Mastick, each two ounces. When the Liquours are mixt, put in the Litharge, let them boil, stirring them continually, then add the Salt and Alum, then the Gum Arabick, and last of all the Powders, boil them to a consumption of a fourth part.

Phil. Jac. Sackius.

12. If it will not give way to gentle Medicines, we must use strong ones: Take of Mercury what you please, dissolve it in Aqua fortis, when it is dissolved, add to it of Sal Saturni, and Unguentum Rosatum Camphoratum, what is sufficient. Make an Unguent. ¶ This Liquour is very good, if cloths be dipt in it and applied: It was successfully used in a Gangrene of the Scrotum: Take of Vitriol 1 ounce, tops of Oak 1 handfull, Frankincense 1 ounce, Camphire two drachms, Wine 2 pounds and an half. Boil about a third away.

Sennertus.

Turnheuse-rius.

13. The Juice of the Herb Alexanders in Unguents stops Gangrenes wonderfully. It is a Secret.

14. Salt of Soot is made thus: Let Soot be powdered as fine as flower, dissolve it in Vinegar, let it settle to the bottom of the Vessel, separate the Vinegar, and dissolve it in other Vinegar, continuing it so five times, and you will find a Salt, which, if it be put in a moist place, will melt, and make a most excellent Oil for Gangrenes and malignant Ulcers.

Joh. Vigorius.

II. A Ganglion sometimes, when it is deeply radiated, hinders the motion of some joint; therefore some course must be taken with it betimes, which we do by premising convenient Evacuations, and applying emollients and digestives. But we must have a care, as much as may be, that no suppuration do follow here, because when it arises of it self, or is caused through carelessness, it brings with it perverse, and oftentimes incurable Ulcers, by which these nervous places are sometimes so corrupted, that the motion of that joint is oftentimes either lost or depraved.

Platerus.

III. In some places Ganglia are cured with the Knife, in others, as in the Feet and Hands, it is very dangerous to wound them with a Knife. Therefore Ammoniack, or some other Malackick, must be applied, that it may cover the whole Ganglion, a plate of Lead must be laid over it, and it must be tied on very strait, and so as that the Ganglion can slip no way. Some onely tie on a plate; and when in a few days they find it softened, when the Lead and Plaster is taken off, they set the right Thumb upon the Ganglion, and set their Fingers round about, and press it as hard as they are able, till they break it in pieces: This indeed was the old way, but now it is out of use. The present age does better, Men observe the membranaceous Stalk, the Glands and Branchings of the Veins, where the Ganglion rises, and whereby it is increased, they open a way by the Knife, they lay all bare, they tie the vessels with a thread, they turn aside the Nerves, they bind, dry, consume, burn and cut off the Stalk, Glands and Veins, whereby the Disease is sed, and that way as it were extirpate the root of the Disease, that new matter may not breed afterwards, and no new Ganglion may grow again. Although this way of cure is not without danger, if the Ganglion be great, and in a place where many great vessels and Nerves meet. Sometimes also the vessels underneath are corrupt and putrefied, great veins and arteries, which being laid bare, bleed excessively, so that no man can stop them, whereby the Patient is killed in a short time. Turpentine, quick Lime and Goose-grease, well tempered together, dissolve a Ganglion.

We must have a care how we cut a Ganglion or Lupia. I.
It must not be brought to Suppuration. II.
The old and new way of Cure. III.

I. IF a Ganglion will not yield to Medicines, it must be cut out with a Knife, unless it be in the hands or in the feet, or there be danger of Nerves, Veins or Arteries, wherewith sometimes it is implicated. A Lupia also must be cut out, as a Gland, like as we did a few days ago, near the Jugulars, with good success.

Chalmers.

I. Gibbosity has its original from the Spine, when the vertebrae start outwards, or on one side, out of their natural place, to which sometimes an external cause, but most of all an internal cause gives occasion, especially when some pituitous humour is gathered thereabout. This humour must be removed by Oils and Plasters, that have a dissipating virtue, before the prominent part be reduced to its natural place, by an Iron Instrument fitted to any man's body. This reduction is performed not so much by pression, as by the emollient virtue of the Iron. This is the reason, why when the Patient is already cured, he must use a Stay for a year or two longer, that the soft Bones may not start out again.

II. Mr.

II. Mr. Ranchinus cured a luxation in the *Spina dorsi* in the Noble Lady N, which came from a Catarrh falling from her brain upon the Spine, whereby two *vertebrae* in the middle of the Spine were displaced. After Universals she used a Barbers Press, where he presses his Linen with a screw, she applied one board to her back, and another to her breast, but she left off the use of it, because the compression of her breast hindered her breathing. At length she used that Instrument, whereby they use to heave up Coaches, when they stick in some hollow place, (in French *un Grig*) on whose circular end they laid a piece of wood, to be fitted to the displaced *vertebra*, putting a linen cloth between: The other end of the Instrument was set against the Wall, then the Patient was held fast about her Shoulders; afterwards the instrument was forced gently, till she could bear the pain no longer, at which time she desisted. This was done twice a day, and so the Luxation was cured by degrees.

Riverius.

III. A Nobleman of a tall stature, about 40 years old, was so crooked, that all who met him, might well have taken him for one of Ninety, rather than one of that age. He went to several, who make it their profession, either to restore dislocated parts, or to reduce such as are misshapen to a due figure, but all to no purpose. The man was very much troubled, and as he was curious to get a remedy for his indisposition, among others he came to me. This evil conformation of his Body seemed to arise not so much from any fault in the bones, as from his Muscles being loaden with ill humours. While therefore I was preparing and purging the humours, and applied such fomentations, as I thought proper for his Disease, he began, not beyond some hopes, but far sooner than I expected, in six weeks time, to be so well, that he could carry his tall body upright. This observation may serve for admonition, that Anatomy do not deceive the unwary, while they think that all external deformity takes its original from some bone distorted inwardly.

Kerckerlingus, Obs. Anat. 45.

IV. In the year 1668. I saw a bending and a distortion of the whole Spine, from top to bottom, in a Boy and a Girl, caused by humours settling there after a Fever. Chirurgeons were sent for, they attempted restitution by Machines and Steel Stays. I, contrary to the Chirurgeons mind, restored them perfectly by dissolvents and Strengtheners, the humour being dissolved, that filled the Muscles and Ligaments, and driven back by *Metathesis*, it not as yet being fully settled there.

V. I shewed the way for a certain Nobleman's Child, that was crooked in his back, whose Spine stood very much out, how in his Infancy they might make Iron Stays, such as armed Men wear, made of thin plates, and covered inside and outside with Cloth, for him to wear. Which being done, when he had worn it about a years time, night and day, and was so used to it, that he found no trouble in it, by degrees his crookedness was pressed in, and the Spine came to its natural straightness: So that afterwards he always went upright, and grew a very tall man.

Medicines.

I. *Rondeletius*, cap. 57. writes, that it is difficult to cure a *Gonorrhœa*, unless the cause be known; and he adds, that he knew a Nobleman, who after a cold Imposthume in his Kidneys, was long ill of this Disease, and was always much worse, when he used things to extinguish seed, whether cold or hot: That he ordered him a quite contrary course of Diet, and bid him drink generous Wine, and eat good drying Food, which was not windy, by which means he was cured. And the Cause of such *Gonorrhœa*'s is not always wholly in the Genitals, but sometimes in other parts, or in the whole body: Wherefore he also advises, to give such things as correct the crudity of the Stomach.

Sennertus.

II. There is a threefold division of a *Gonorrhœa* not sufficiently considered by *Galen* nor by other Physicians. There are men, who through the heat of the Kidneys, Liver and seminal Vessels, breed abundance of hot Seed, whom it often provokes to excretion in a dream. This kind (to which both Sexes are obnoxious) if it be excessive, does pine away the Body to a Consumption. Another sort of *Gonorrhœa* is produced by putrefaction of abundance of Phlegm, either salt or crude, which is often mixt with a little Seed, and especially from the Brain, by the *Spina dorsi*, Loins and Kidneys, and also from the Liver by the Veins, and by the Nerves which come to the *pubenda* from all parts of the Body, and by the seminal Vessels and *Cremasteres* joined with the Stones, to the *uterus* and *Penis*, from whence it drops by degrees, not without excoriation of the parts: The matter of this is crude bloud mixt with impure humours, the sink whereof does not, as some think, run to the Bladder, but to the Womb and *Penis*, and by the passage of the sperm is voided into the *Penis*. The running of these humours both before and after the *Menfes*, (for in the beginning, the ebullition in the bloud then being high, they run plentifully, though in the middle of the time they do not stop in some.) The Greeks call it a *Gonorrhœa* in both

both Sexes, but the Latins, in Women call it *Menstrua pituitosa*, of which *Hippocrates*, 1 de M. Mul. speaks. But I would have you well remember what he tells us, 2 de morbis. "Unless, saith he, after the defluxion of a Catarrh and Seed from the head by the *Spina dors*, which some feel to creep down like Ants, you purge the Head and whole Body well, the Patient will pine away, and die of a Consumption, which they call the Back Consumption. They that would cure both kinds of Gonorrhœa with the same Remedies, are mistaken: For cooling and astringent things, by reason of the weakness of the Vessels, and because they dry up Seed, are good for the first, which are plainly hurtfull for this second: For it stands not in need of things that astringe and thicken with cold; but because of Crudity and Putrefaction of Humours, it indicates its removal by vomit or stool; by which method I have cured several with purging and a spare Diet. The third sort of Gonorrhœa comes from the venereal Disease, and is called virulent; in which at the beginning a sort of white and yellowish matter dribbles away insensibly, waking as well as sleeping, from the seminal Vessels. And this sort cannot better be cured than by a decoction of *Guaiaicum*, or anointing with Quick-silver.

J. Langius, Ep. 5. lib. 2.

III. Let young Physicians observe what is taken notice of by few Practitioners, that Seed, Pus and Phlegm, although they shew all alike white in the Urine, yet by a skilfull man they may thus easily be discerned. The Seed, when it is separated from the rest, swims constantly at the top, nor will it sink, though it be shaken, no not in a Gonorrhœa. Pus and Phlegm do both sink to the bottom: but at the least shake Pus flies in funder, so as it cannot be discerned, onely it makes the Urine white as Milk. Phlegm rolls about. Purulent matter parts a little, and rolls about a little, but both of them, when the Urine stands still, presently sink to the bottom, the Seed always swimming, unless it have contracted a great putrefaction from its virulence: For when it putrefies, the Air being evaporated and consumed by extraneous heat, it must of necessity grow heavier, and therefore sink to the bottom, and when it is shaken, stick to it.

Ab. Heers, Obs. 18.

IV. A Gonorrhœa is commonly reckoned by all men, a Disease caused by some fault in the spermatick Vessels. But *Veslingius* his judgment is truer, who reckons it rather an Ulcer of the Prostate, voiding not so much Seed, as *Sanies* and affluent, corrupt humours: Which the plenty of matter sufficiently shews, oftentimes exceeding a Quart; and the smell and colour shew it to be something else than Seed, especially when it has continued any time. There lived a Man at Padua, who was ill of such a Gonorrhœa for thirty years. Besides, the very substance of the matter, that is mixt with the Urine, represents something different from Seed, because it sinks to the bottom: but it is the Nature of Seed to swim at the top, and when the Urine is shaken, not to part asunder. Yea the cutting open of dead bodies often proves it, whereby such Ulcers are found in the Prostate that we can scarce doubt any farther of the matter. See *Rondeletius Pract. l. 2. c. 9.* and *Palmarius 2. de Lue c. 9.* *Camillus Thomajus, Meth. Cur. c. 57.* thought that a Flux which lasted Months and Years in a Woman without weakning the body, ought not to be called a Gonorrhœa, but a catarrhal Flux. Nor did *Veslingius* much differ, when he often commended to us, as the onely scope of a right cure, to absterge and dry rather than to bind. Therefore he, to the benefit of many, did successfully use Conserve of Mallows, and a decoction of Marshmallows with Turpentine and Powder of Rhabarb. I saw such a Gonorrhœa cured at Padua by giving *Bolus*'s of Cassia with Turpentine and *Mercurius dulcis*, prepared according to art:

as also Emulsions of Hemp seed, and other cooling things, with Spirit of Turpentine: With cleansing injections of Whey with white precipitate, continued for four days: Lastly, an Electuary made of old Treacle, extract of Juniper, *Confectio Hyacinthi* and *Crocus Martis*. Nor did *G. Harduynus de S. Jacobi*, commend the decoction of the root of *Statice* (it is a kind of Mountain Giliflower) for any one intention more than for that of drying.

Veslingius, Obs. 67.

V. We must not stop a Gonorrhœa rashly, nor presently, or at a venture; for it has been often seen, that they who have endeavoured to stop such Gonorrhœa's unseasonably and violently, especially before the Body has been purged of its filth, have had Buboës, Inflammations of their Stones, and have been troubled with pains in their Kidneys and Loins, and with a thousand other afflictions. Wherefore before we put our helping hand to the part affected, we must provide for the whole Body, lest some such thing, or worse, befall us. The best way therefore of cure is that which cuts off every Cause, beginning with the most prevalent.

Mercator.

VI. Concerning the cure of that which is said to be caused by watry and thin Seed, we must carefully observe, whether it be true Seed that comes away, although it be watry, thin and crude, or whether, as *Langius, lib. 2. ep. 5.* takes notice, it be corrupt and vitious humours, which being gathered in the Body, flow to the Genital parts, and are voided by the passage, whereby Seed is usually cast out: as sometimes vitious humours, gathered in the Body, use to be evacuated by the Womb, which they call the Whites. In the first case we must use such things as incrassate Seed, make it firm, and detain it. In the second we must not use incrassating and astringent things, but evacuators, correcters of Cacoehymy, and a good Diet. Therefore *Langius, l. c.* says, "I can safely swear, I have cured several onely by purging *Sennerthus*, and a spare Diet."

VII. Sometimes it is caused through abundance of Wind, gathering of crudities, want of sleep, or eating windy things: If you endeavour to stop this with Medicines that extinguish Seed, you will make it much worse, because such sort of Medicines are exceeding cold, whereby the intemperature, which is the cause of the Gonorrhœa, is increased.

Rondeletius.

VIII. The Seat of a virulent Gonorrhœa is in the Prostate and the *Vesiculae seminales*, which if it be unseasonably stoppt, the virulence is communicated to the whole Body, or it flows back to the Stones, and there causes a Tumour, or if it extend to the perineum, unless it be timely repelled, it causes an Abscess, and erodes the Urethra. It is not safe to let blood in the Arm, if the heat in these parts be gentle, and without a Fever: Blood must rather be let in the Foot, because the *Saphena* arises near the Groin, and imparts two branches to these parts, and therefore large blood-letting does make powerfull revulsion, when Buboës break out. Few or none besides *Palmarius* and *Fallopianus*, let blood in the Arm, which is suspected, for fear of the Venereal Disease, through a reflux of the virulence into the bowels and habit of the Body.

Riolanus.

IX. Now a days some reckon the matter must be purged from the whole, yea, and diverted to the ways of Urine, perhaps after *Galen*'s example, who a long time after Hydragogues, used Diureticks with success; and therefore some give Turpentine washed in Mallow water, with Powder of Liquorice. But in my practice I never found any good from Diureticks: Nor do I give Turpentine, except in Contractions and Convulsions of the Vessels and the Penis. Wherefore I have seen the cure succeed happily, by deriving the matter to the Ambit of the Body by Diureticks and Sweats, with the help of some proper decoction.

Fortis.

X. Im-

X. Immoderate *Venus* is commended, as indeed it has done good to some, the venomous infection being poured out with the Seed, while it has not as yet penetrated deep into the substance of the similar parts, yet because it draws the humours from all places into the parts affected, and causes an Inflammation, it must be omitted.

Enchir. Med.
Pract.

XI. If a Woman's Womb by continual coition be full of Seed, she does not conceive, till the Womb unburthen it self, which stagnating there a long time, hence sometimes *mola* arise, the Drophe, Wind and Flux of the Womb, like Women's Whites, which yet it is not. Nor is it a *Gonorrhœa*, which if Women once suffer, they are ever afterwards barren, all remedies proving to no purpose. This excretion is known, for a cold matter comes away without pain and emaciation of the body. Moreover this Flux must not be suppressed, but rather provoked.

Panarolus.

XII. One came to *Spaw* to get a Remedy for his impotency, because he let go his Seed at the first touch of the *Labia*; but it was watrish and very like Whey. Because this happened in a sound body, and I could imagine no other cause, I told him, I thought he had an Ulcer in his *intestinum rectum*, therefore the vessels necessary for the preparation and ejaculation of Seed, being affected with a putrid vapour, did breed Seed which was insufficient for a long tension of the *Penis*, and for a brisk coition. Then I ordered a suppository onely of Honey, and it was drawn out again besmeared with much thick Pus. Then a Chirurgion was called, who with his middle Finger found a great and deep Ulcer. To whom when Medicines were applied, that manifestly did him good, he went his way, and neglected the cure.

Feers, Obs.
Med. 10.

XIII. Things that abate Seed, or Antivenereals, either diminish the product of Seed, not so much by subtracting the quantity of Aliment (which indeed makes much for the diminution of *Venus*), as by hindring the gathering of Seed, or by constriction, wherefore Saturnines inwardly have the first place, especially *Saccharum Saturni* made by Evaporation, which by its intense sweetness stimulates the Tongue, but in truth by the parts of the distilled Vinegar, joined with the metallick ones, it does as it were centre the *Serum* (for in my judgment Seed is the finest cream of the *Serum*) so that it cannot grow turgid, or reach to the genital parts, but weakly, wherefore given in plenty it emasculates and binds: And for this reason *Tinctura Saturnina*, vulgarly called *Antiphthisica*, may by better right be called *Styptica* and *Antivenerea*. And by dissipating and destroying the Semiform consistency, procuring a diffusion of the Spirits, such especially are Camphorates, and bitter things, as Absynthiacks and Aloeticks, have partly some respect hither, so *Vitex* and leaves of Rue, &c. Or they take off the Stimulation, Orgasm and Acrimony: Such especially are watry things, Coolers, as Water Lily, Lettuce, Purslain, Emulsions, &c. For as the heat of the Kidneys, or of the blood rather, and the vigour of the *Serum* make much for the separation of the Seed in the Pampiniform passages and Pores, so things which dilute and temper the heat, breed a less vigorous Seed: Therefore Drunkards, who drown their Bodies with too much drink, are unfit for Generation. And earthy things, which precipitate, and abate the motion of the Blood, and consequently of the Seed, so among Vegetables, Strawberry and Agrimony, &c. *Terra sigillata*, Coral, Bole Armenick, *Os Sepie*, which, and its Magistery, is not amiss made use of for curing a *Gonorrhœa*, all the Saunders, &c. And acids, which obtund the vivid Sulphur of the Blood, and are also apt to hinder the glutinous consistency of the Seed. Therefore all acids are commended. So I have observed that *Hepaticum rubrum*, or *Crystalli tartari vitriolati* and *Santalati*, have

done much good in abating nocturnal pollutions. One by the constant use of Spirit of Vitriol, whereby he endeavoured to correct the weakness of his Stomach, had his *puendum* and *testes* shrunk up and extenuated. And Nitrous and Mercurial things, in as much as they make the Seed fluid, so nitrous things in general, which also invert the Sulphur. Thus one in *Timew*, who was extreme libidinous, at length by taking a large dose of Nitre, ceased to be such. But beside this, Mercurials intimately possess an acid Salt, rendering the *Serum* and Seed fluid, exhaust the Nerves for business, and are apt to weaken the muscous and nervous parts; therefore *Mercurius dulcis* is highly commended in a *Gonorrhœa* simple and virulent. Or finally, Middling things, which are apt to correct the motion of the *Serum* and Fluxions, and so they moderate the Afflux, mitigate the Acrimony, by their balsamick virtue keep the consistence entire, and strengthen the feminal Vessels, cleanse them when ulcerate, lax and virose, and divert them another way, such indeed as are proper for Catarrhs in general, or for any known Fluxions of the *Serum*, to wit, Succinates; wherefore I have observed that such diverting things, for Example, Essence of Amber, joined with the Bezardick Anodyne, has very happily cured a *Gonorrhœa*. Whither pertain also Sudorificks of the Woods, &c. For we must take notice that the class of such things as abate Seed, has a great latitude, they cause chastity, they are proper for the Faults, Fluxions and Ichorefcency of the Seed; wherefore they are convenient, chosen with judgment, in all *Gonorrhœa's*, nocturnal Pollution, simple and virulent, in rampant Lust, yea, and for Women troubled with the Whites.

Wedelius,
de f. m. fac.
p. 225.

XIV. Of the aforesaid things many applied outwardly conduce to temper the heat; so leaves of Vine, Willows, *Agnus Castus* use to be applied outwardly, leaves of Water-Lily, which yet are of the lowest rank. Saturnines deserve to be remembered here before all others, which as inwardly they are adverse to *Venus*, so outwardly they contribute much to the same end; hence plates of Lead are usual, not onely by reason of their native Coldness, whereby they repell and allay, but also because they extract the saline Acrimony as it were magnetically, which we may gather from hence, because every part affected under this leaden cover, uses to be moist, in which sweat the sharp Salt increasing, the heat goes out continually, and by its Acrimony endeavouring to dissolve the *Saturn*, it visibly sticks thereto; which plentiful attraction of Salt is made by benefit of the *Mercury*, wherewith *Saturn* abounds. Now *Mercury* does entirely love the company of the Salt, and so it procures Exhalation, and having first made an actual refrigeration, it causes a potential one.

XV. A certain Doctor of this City cures a virulent *Gonorrhœa* successfully with *Cantharides*, which he steeps in Rhenish Wine, giving the infusion tempered with some other Liqueur: but because in the beginning he could not go on with the cure, without great torment and exulceration of the Bladder, at length he mixt it with Oil of sweet Almonds, *Syrupus Fernelii*, and juice of Mullen, and so in three days sweetly removes the Disease by plentifull Urine. ¶ I have in another place commended an Infusion of *Cantharides* for a virulent *Gonorrhœa* and difficulty of Urine, the happy success whereof I have tried more than once. But we must observe, that the *Cantharides*, lest they do hurt, must be used whole. And when we make a Veficatory, the extremities may be taken off, wherein there is a more gentle faculty, which may be kept for this infusion, to purge by Urine. If this infusion be ordered in due manner, it pro-

M. J. Mat-
thial ad
T. Barth.
Cent. 4.
Ep. 55.

T. Barth.
Ep. 54.
out

out exulceration or torment, so that there is no need of fat things.

XVI. The virtue of things that diminish Seed varies according to the different Constitutions; for as every Agent in general acts according to the manner of its reception, so when Contraries occur in Authours, for example, that *Agnus Castus*, Rue, Mint, do diminish *Venus*, and provoke it, do abate Seed and produce it, these Effects must be ascribed to the difference of Bodies. So green Mint increaseth *Venus*, dry abates it.

Wedelius.

XVII. This same virtue of theirs is different according to the state of the Seed, and as simple wasting of it, or astriction is indicated, for all things are not convenient for all Persons. Thus in nocturnal Pollutions cooling acids, watry and gentle styptick things are proper. In a simple *Gonorrhœa* acid and nitrous things; for lixivals, whatever Practitioners deliver to the contrary, must rather be avoided. In a virulent one Mercurial ones in the beginning; but acids and nitrous things are not so good: Nitrous things are potent in abating Lust, but they must not be made use of in the Flux. The middling things are better for the Flux, than when it is stop.

Idem.

XVIII. In diminishing of Seed we must have a care we run not into the other extreme or contrary. Therefore in general Absynthiacks, Saturnines, and other things which we have reckoned up, are not so proper for new married Persons, that is, in a large quantity; and in young People we must have a care how we meddle with them, especially for such as are troubled with nocturnal Pollutions. Nocturnal Pollution is a Disease of that age, wherefore the Seed and its Organ should be checkt, and its acrimony may be abated, but it ought not to be extinguished. I knew an old Man of Seventy, of a hot Constitution, who had been troubled with nocturnal Pollutions from his Youth to his extreme Old age, and nevertheless he was blest with a numerous Issue.

Idem.

XIX. Mercurials rather increase the Flux of Seed than check it, that is, of themselves they make the Seed more fluid; wherefore we observe, that after the use of them, and giving of Purges, the flux of Seed is always as it were increased. How proper therefore however it be in the beginning for a *Gonorrhœa*, either virulent or simple, given with a Purgative, that is, *Mercurius dulcis*, yet this is done for the sake of absterfion, mundification and diversion, rather than for astriction. Wherefore it is conveniently given in such a manner, as that the Ulcer of the *vesicæ seminales*, which arises of acrimony contracted from impure Coition, may be cleansed, and fitted for consolidation, so that he who would proceed with these things alone, and exhaust the matter, would labour in vain. For then, that is, when these things have been already used, strengtheners, of Agrimony, Strawberry, Succinates, and the like, which makes the lax parts firm, mitigate the acrimony, and stop the fluidity, may commodiously be subjoined.

XX. We must not rely on external Oils and Unguents, for wasting and checking of Seed: For these very things make the tone of the genital parts more lax, and so rather promote than stop the Flux. Wherefore *Unguentum Ros. Mesues*, *refrigerans*, *Galeui*, Oil of Henbane, and other Oils which are usually commended, have indeed sometimes their place, especially anointed on the Loins; but it is better to insist on internals than these. Nor will you doe any good by anointing the Stones therewith; to say nothing that Oils heat the Parts.

Idem.

XXI. *Tinctura vitrioli Martis Saturnifata* commonly called *Antiphthisica*, according to my experience, succeeds well, if, in a moist way *Acetum stillatum Saturnifatum*, or that which has contracted a saturated sweetness from the *Minium*, be poured upon *vitriolum Martis*, either powdered or whole: Or, in a dry way, if Vinegar and Spirit of Wine be poured on *vitriolum Martis* and *Saccharum Saturni*, each a like quantity, and mixt together. Patients that are ill of nocturnal Pollutions, do usually, after taking of this Tincture, especially in a large and continued dose, lose their Appetite.

XXII. When onely a virulent *Gonorrhœa* afflicts a Patient, and the mass of blood is not as yet infected, the Cure must be applied onely to the *Gonorrhœa*. But when the mischief has crept farther, and has infected the whole mass of blood, then the universal cure must be premised, at least joined with it. And a rational cure of a *Gonorrhœa* will be insisted on, if we consider, that it follows an Ulcer in the *Prostate* and *vesicula seminalis*. For although I do not deny, that onely a debility in those parts, does often remain after too much coition, and breeds a *Gonorrhœa*, of many years continuance; yet no *Gonorrhœa* will ever be virulent, unless beside the Seed, the blood also, that comes for the nutrition of those parts, do corrupt into a sharp and virulent humour, such as is usually voided in a Venereal *Gonorrhœa*, therefore called virulent. And that which so corrupts both the Seed and Blood, will more or less corrupt the containing part also; and therefore will at length raise some sort of Ulcer in it: Since therefore there can be no other part that contains the virous matter, besides the *Prostate*, and the *vesicula seminalis*, they may deservedly be said, either one or both of them, to labour of an Ulcer. A thing that must never be passed by, when we insist upon the cure of this Symptome, which will never be happily performed, unless the Ulcer be removed, and the Disease which this Symptome follows. Therefore in the dogmatical cure of a virulent *Gonorrhœa*, we must think of cleansing and healing again of the Ulcer, and of correcting or removing its cause. The cause of this Ulcer is a sharp and virulent humour, communicated in Coition, sticking about these spermatick Vessels, corrupting the Blood and Seed, and after the Afflux of it when corrupted, remaining in part in the solid and containing parts, and by the corruption of the new affluent matter perpetuating both the Ulcer and the virulent Flux. He therefore will, according to art, and successfully, cure a virulent *Gonorrhœa*, who first corrects that virulent and sharp Ferment, which caused and maintains the Ulcer, and corrupts the Seed and Blood; or, who wholly discharges the Body of it. Secondly, who cleanses and heals the Ulcer produced by it. And all the Medicines that are vulgarly commended in the cure of a virulent *Gonorrhœa*, do answer these few indications, as he will easily observe, that considers all these things with an attentive mind; although few, when they are about the Cure, do sufficiently observe all these things, wherefore no wonder, if so often the cure succeeds either not at all, or but very slowly. Divers Emulsions, which are commonly used in this case, correct the sharp and virulent Humour, and Decoctions, which they call emollient and lenient, being made of *Liquorilli*, Barley, &c. Turpentine it self, and its Oil, Balsam of Peru, *Oleum de Copiva*, &c. 2. The same Decoctions, in a manner, Emulsions, Oils and *Cantharides*, &c. do void the same sharp and virulent humour by the way of Urine, while being endued with a Diuretick faculty, they discharge

charge that virulent ferment together with the Urine. And if any Man will but with an attentive mind consider all these things, he will easily find, they are good to temper and expell an acid and sharp humour, and therefore that a virulent *Gonorrhœa* depends upon, and is produced by such a humour, as we have proved it from all the Symptoms of the Pox, and now do confirm it by Medicines that are proper for the Cure of this *Gonorrhœa*, and such as are found so onely by Experience. Certainly all things which powerfully alter or correct the humour in a virulent *Gonorrhœa*, are either Aromatics, or at least do more or less temper an Acid, among which, Crabs Eyes do not come in the last place, very necessary and usefull in curing of this Disease. The method therefore of Cure consists partly in alteration and tempering of a sharp humour, that breeds and maintains the Ulcer in the Spermatick Vessels and Glands, and partly in the Expulsion of the same with the Urine, when it is more or less contempered, as by the next and commodious way: For which purpose also sudorifick Decoctions, commended in the general Cure of the Pox, may be used, because they do not onely expell the peccant humours by Urine, but they also temper the sharp and acid. Partly in cleansing the Ulcer, and then in consolidation of it, both by Turpentine wash, and by it boiled, and by its Oil, and by Balsam of Peru, *Oleum de Copiva*, several sorts of Balsam of Sulphur, &c. Partly in strengthening of the same Glands, *Prostate* and *vesicula seminales*, that are weakened with this malignant Flux, by gentle Astringents and Aromatics, things endowed at least with a fixt Salt, which destroys an Acid, Castor, Amber, Myrrh, Mastick, Coral, Bloud-Stone, *Lacca*, &c. to be taken inwardly: and such like things, to wit, Oil of Mastick, and other things to be applied outwardly to the *Perinaeum*. And in such a Method a virulent *Gonorrhœa* will be cured successfully, which, if neglected, or not well observed, sometimes it is rendred in a manner incurable, and especially by reason of the part extremely weakened with a long Flux.

Sylvius de
le Boë, App.
Tr. 3. Sect.
332, seq.

Medicines especially made use of by eminent Physicians.

1. This is very famous both for them that lose their Seed walking, and in their sleep; Take of Seed of Willow seven drachms, Calamint six drachms; Seed of white *Vitex* five drachms, Rue half an ounce, Hemlock Seed two drachms. Make it with water into Trochisks. Give the quantity of a Hazle-nut in five ounces of *Posca*.

Ætius.

2. Among noble Confections this is reckoned most effectual; Take of Pine Nuts, first washed in water, Pistachio Nuts, Seed of Cucurbit, Cucurbit, Raisins, each half an ounce, Cinamon, Mace, Seed of Anise, *Agnus Castus*, each one ounce, Camphire one drachm. Make it with Sugar.

Alex. Benedictus.

3. This Confection wonderfully helps a *Gonorrhœa*; Take of Seeds of Melon two ounces, Cucurbit one ounce, *Agnus Castus* half an ounce, *Acacia*, Coral, each one drachm, *Been*, white and red, each two scruples. With Sugar make a Confection, the dose half an ounce, with three ounces of Plantain-water.

Rod. à Castro.

4. This is singular good for a *Gonorrhœa*; Take of Gum-arabick, Tragacanth, Carabe, Mummy,

Bole Armenick, the mandible of a Pike, each what is sufficient, and with Syrup of dried Roses, or Myrtle. Make Pills of one scruple in weight. At the first time let him take three Pills, and then Crato. one for several days.

5. I commend this for strengthening of the parts; Take of the whole Mastick Tree, with the Bark, cut very small, one ounce and an half. Infuse it in six pounds of Water, add of juice of Lemons depurated three ounces. Digest them in *Balneo* twenty four hours. The Dose is Rod. à Font. six ounces in the morning for several days together.

6. One was cured of a *Gonorrhœa* onely with this Apozeme; Take of Root of Comfrey half an ounce, Plantain, Horse-tail, Daisie, Knot-grass, each one handfull, Sorel one handfull and an half, Seed of Plantain one drachm, Sorel, Mallow, each half an ounce, red Rose Flowers one pugil, Raisins half an ounce, scraped Liquorice three drachms. Boil them in a sufficient quantity of Water. To the Colature add of Syrup of Purflain, Myrtle, each one ounce and an half. Forestus. Mix them. Make an Apozeme for three doses in the morning.

7. If in a virulent *Gonorrhœa* the parts be inflamed and pained, a Cataplasim of Leaves of Rue and Dwarf Elder, boiled in Vinegar and applied is a present Remedy.

8. Powder of Ivory presently cures a *Gonorrhœa*, whether Gallick, or Legitimate, and other Women's Diseases. C. C. de Heredia.

9. Natural Bathes, which have an astringent Sennertus. faculty, are here very good; or artificial ones, which have the same virtue.

10. I frequently use juice of Citron and Lemon with great success, because it conduces much to extinguish Seed. Oil of Henbane, if a Woman's Loins and her *Loci* be anointed therewith, is commended outwardly, and has often been experienced by me. Mercurialis.

11. Purging premised; Take of Wall-Rue one handfull, bruise it, and with a little Flower and one Egg bake it on a Tile into a Cake, yet without Oil and Butter, let the Woman eat this Cake in the morning two days, and her *Gonorrhœa* will presently be stopt.

12. This is an approved Remedy; Take of dried Mint three drachms, Seed of *Agnus Castus*, Root of *Iris*, Seed of Rue, each one drachm, Seed of Lettuce two drachms and an half, white Sugar one ounce. Mix them. Make a Powder. Joh. Zechias. The Dose half an ounce with Chalybeate water, for a Woman's *Gonorrhœa*.

Gurgulionis Affectus, or, Diseases of the Uvula.

The applying of Powders to it, when swelled, sometimes does harm. I.
When it does good? II.
When it is grown long, we must not hasten to cut it out. III.
It must be cautiously cut out. IV.
Imprudently cut off, the Cause of Death. V.
Powders are to be preferred before Gargarisms. VI.
Medicines.

I. We

I. WE must have a care, when the Body is impure, or the part affected is troubled with an Inflammation and Afflux of Humours, that we do not use hot and eroding Medicines; as also if there be any Malignant Quality, bred of an atrabilious humour, or which favours of a Cancer: For Cancrous Ulcers are exasperated and irritated by eroding Medicines. In such I shall rather apply a Medicine made of albes of Crabs with their *Menstruum*. The Wife of N. after riding in the hot Sun, was taken with a defluxion upon her Uvula and Jaws. A Barber Chirurgion was called, who, when he found the Uvula swollen, he blew in a very sharp, hot Powder, three or four times a day. Hereupon an Inflammation and a very dangerous abscess arising, not onely the Uvula, but also the Cartilages of the Nose were eroded, and Ulcers broke out here and there in the Face. When the Matron's Uvula, by reason of the Catarrh, was relaxed and inflamed, and *Aqua Regia* had been indelicately applied, a great Inflammation there followed, with danger of Life: A most dangerous Quinsy followed upon applying Powder of long Pepper and Saffron to the Throat and Jaws.

II. But if it degenerate into the form of a Grape, and you see the Uvula grow narrow upwards, then you must not use Coolers and Restrictants any more, but you must endeavour with moderate Dissolvents, as with a Gargarism onely of hot water, or wherein a little Fennigreek and Fenil has been boiled, and it must be touched with a *Spatula*, strewed with fine Powder of Pepper, Cummin and Fenil. Nor need we fear Pepper in this place, for it is often used alone with good success, when the Uvula is inflamed. For which reason, the vulgar dare say, relying on this Argument, that Pepper is potentially cold, supposing that hot things are onely expelled by cold, not knowing that the chief Cure of Inflammations is to be performed by hot things, dissolving that which sticks to the Part.

III. It must not immediately be cut off, as the stalk begins to grow pale and small; but scarifications must be tried first, which usually give present relief to parts that are almost dead, for a Gangrene will never mortify any part, if they be applied in time. But in this case the Uvula is falling, or already fallen, into a Gangrene, and why should you fear to scarify that, in hopes of restitution, which you are resolved to cut off?

IV. Abscession must not be made over precipitately, if the cure can be performed by any other means, because sometimes by taking it away, either the Voice is hurt, or a Consumption follows, or a bleeding is raised, which cannot easily be stopt. But before it be cut off, we must see what the figure and colour of it is. For it must not be touched, if it be round in its lower part, and slender above, hanging as it were by a stalk: Or, if it be very red, and as it were bloody, that is, speckled with drops of blood, or if it cause pain: For if such an one be touched, it easily turns to a *Carcinoma*. On the contrary, if it be small and long, and not very red, but whitish, in the lower part, it may safely be cut off; yet so, as that onely what is preternaturally eminent may be cut off. Not long since I saw a Chirurgion press the *Columella* with an Instrument, called a Crow's Bill, the Patient's Mouth being opened very wide, then with the other hand he clipped off that part of the *Columella* which was below the Instrument, and no pain, no Inflammation or Hemorrhage followed upon it.

V. A Priest had an Imposthume in his Uvula; another Priest clipped off his whole Uvula with a pair of Scissors, which being cut off, and the Patient's Body being very plethorick, the blood and humours fell in such a quantity on the Breast, and so great a straitness of Breast and Lungs followed, that the Patient could scarce breathe, and finally he could neither spit, nor raise from his Breast, and the third day he was choaked and died.

VI. Although Gargarisms ought to be the same in the relaxation of the Uvula, as in Ulcers of the Gums and Jaws, in the beginning astringent and repellent, afterwards resolvent and exsiccant; yet where no inflammation is, the use of Powders is more effectual, for so the astringent and drying is more powerfull.

Medicines especially made use of by eminent Physicians.

I. For falling down of the Uvula.

1. Take green Nuts and Date-stones, and when you have a mind burn them sufficiently, and take equal parts of them, and powder them dry. You may use them so: They are very discutient.

2. This is an excellent Plaster, if Bayberries, Penniroyal, wild Marjoram, Horse-mint and Savine be bruised and boiled in Honey, and applied to the Head shaven.

3. I have often tried this Powder does excell most Medicines: Take of Pepper, Cinnamon, each half a scruple, Bark of Frankincense-Tree, Galls, each 1 scruple, red Roses 2 drachms. Make a Powder, wherewith the Uvula must be touched.

4. Let the Kernels of Walnuts be beaten with Spirit of Wine, and applied to the Coronal Suture.

5. For Children, a clean Paper four times double, wet in equal parts of the Mother's Milk and Rue water, applied to the Crown of the Head, is good.

6. For a loose Uvula to dry up the humidity, this is a certain experiment, if a little Saffron be put in Man's Urine, and one gargle with it.

7. If the matter be small, and the Head not very full of Excrements, it is cured onely by touching it with long Pepper. It is beaten very fine, and the end of the Uvula is touched with it, which being touched twice or thrice, they spit Phlegm, and it is quickly contracted and made shorter.

8. For the falling of the Uvula. Take long Pepper, Ginger, each half a drachm, Granes of Paradise 1 drachm, Pellitory of Spain, Alume, each half a drachm, *Album Græcum* 2 drachms. Mix them. Make a Powder which raises the Uvula.

9. Hemp-seed boiled a little in *Possa*, strained and used for a Gargarism, scarce ever fails.

10. Water of Spleenwort is admirable in a sore Throat.

11. An excellent Powder is made of *Album Græcum* dried, mixt with other things, if it be applied to a lax *Columella*.

II. For Exulceration and Inflammation.

1. This is an excellent Medicine for an Inflammation of the Uvula, both in the beginning and in the height: Take of *Rhus Culinarium* 1 ounce, Flowers of Roses half an ounce, Saffron half a drachm,

Æcius.

drachm, bruise them and powder them. Take half a Spoonfull of this, and dissolve it in three ounces of Water and Honey, and make a Gargarism.

Cortilio.

2. Some reckon this as a secret, and believe me, in Ulcers of the Tongue, Mouth and *uvula*, it does wonders: Take of common water two ounces and an half, Powder of Sublimate half a drachm. Let them boil till the Sublimate be melted, and strain it, wherewith touch the ulcerated places Morning and Evening.

3. This is a most generous Decoction to stop the Defluxion; Take Galls, *Rhus Culinarium*, and *coriarius*, Fruits of both the Tamarisks, Flowers and Rind of Pomegranate: All, or any one of these boiled in Water, may be given to gargle Nicol. Piso. withall.

4. I have tried this: Take of Pepper half a drachm, Powder of Venetian Orrice 2 drachms, Juice of Liquorice 1 drachm and an half, Sugar-candy 2 drachms, Honey 1 ounce. Mix them. Rondeletius. Make a Lohoch, and lick it.

A

A GUIDE TO The Practical Physician.

BOOK VIII.

Of Diseases beginning with the Letter H.

Habitus Corporis vitia, Cutanei Affectus;
or, Diseases of the Habit of the Body,
Diseases of the Skin.

(See Scabies BOOK XVI. and Cosmetica, BOOK XIX.)

The Contents.

The habit of the body may be vitiated, when the Bowels are not hurt. I.

Bloud must be let sparingly. II.

A grievous Itch requires a cure like that of the Pox. III.

Striking of it in must be avoided. IV.

When we must use Repellents? V.

Cured by setting Leeches to the part. VI.

A Palsie arising upon striking in of Pimples in the face. VII.

A pertinacious redness in the face cured by opening a vein in the Forehead. VIII.

Whether SPAW-waters be good for a Pimpled Face? IX.

Whether a Sweat be good for a Ring-worm? X.

Whether Bleeding or Purging be good for Exanthemata? XI.

Blackness of the fingers cured by a Fume. XII.

We must have a care how we stop Sweating of the feet. XIII.

In external Pains, ascribed to a Catarrh, bloud letting is convenient, though the cause be cold. XIV.

I. A Peculiar Republick and Regiment is constituted for the habit of the Body, it has also its Diseases, not depending upon the interior regiment; Hippocrates and Galen call it, *ἰσχυρὸν τὸ σῶμα*, or, The bulk of the whole body. The Arteries and Veins, that reach to the Muscles and Skin, belong to it. A cutaneous Itch often arises, when the Bowels offend not at all, which also is

cured onely with externals. It happens also, that a Scabies ferina infects the Skin, while the Arteries run dreadfull putrefaction, and administer matter to it, as they carry impure feculencies with the blood, and they not being received nor carried back by the Veins, are left in the Pores.

II. Hippocrates lib. de Humor. although he order Revulsion in an opposite part; does yet except the Humours poured out into the Skin, which he forbids to be drawn inwards, because the inner parts are more noble than the outer: Besides, because humours once poured out to the Skin, get a bad quality, so that if they once go inwards, they ever prove pernicious. Let Physicians have this rule before their eyes, while they are upon the cure of Diseases, that infect the outer Skin, that they let not blood in such a quantity, as to make revulsion to the inner parts, lest perhaps it happen, as it did to reverend N. who labouring of the Itch, would have 4 pounds of blood taken from him, by opening a Vein: Upon which, that very day, revulsion of the putrid humour being made from the Skin to the greater Veins, by Venæ-section, he was taken with a Malignant fever, which killed him on the fifth day. For in such Diseases I do not let blood, or in a very small quantity, both for the reason above-said, or because a Cacoehymie prevails rather than a Plethory.

III. A certain Physician cured grievous Itches successfully, which were despaired of by others, onely by giving a powder made of equal parts of Sassa, Rheubarb and Senna, in Broth, for 40 days; and anointing the body onely with *Unguentum de saccis*. For such Diseases being near of kin to the Pox, do, in a manner, require the same cure, as formerly J. B. Montanus did advise. Others commend the like powders; as N. Massa, p. 1. Ep. 30. does also commend decoctions of Purgatives, mixt with uctorificks, whom others do follow; though *Rondeletius* *Sennertus*

Rollinacius,
Diff. vi.
Anat. p.
1283.

Marrastus,
con. in chi
loc.

Sennertus and *Chalmetaus* disapprove of such Medicines, who never used them, because they are inconvenient and dangerous, by reason of contrary motions; which *Ballonius* reckons may be compared to purging in the Dog-days, *l. 1. Epidem. p. 41.* Yet experience shews they are usefull.

Vellechius,
Obs. 84.

IV. A Boy ten years old was afflicted with the Itch, which ouzed out an ichorous matter: A cold season coming on, it was suppressed, and the filthy matter was turned upon the Lungs, which caused a horrible *Asthma*, which ceased immediately, as the Wind turned to the South.

Pachequus
ad Riverium
obs. 53.

V. *Galen 14. meth. c. 17.* speaking of the Ringworm, says, that if but a little excrement be repelled to a principal part, it does no little harm; because this is dissolved by the bowels, speaking there of a Roman Matron's Ringworm, which would never have been cured by a Medicine of Sea wrack, had not *Galen*, by stealth, put a little Scammony in her Whey, which she drank: The reason was, because there was a great fluxion to the Part. Repellents therefore, before evacuation of the Excrement, always doe harm, except in a case where it is but small.

Sanctorius
de Remed.
Inv. c. 15.

VI. Leeches did a Melancholick woman a great deal of good in a *St. Anthony's Fire*, which ate her Leg, by drawing the hot and adust blood from the next veins, which, till then, did constantly supply the stubborn Sore. And the blood being voided, what remained was easily cured by Bread soaked in Water only.

Tulpius,
l. 4. obs. 13.

VII. One, by reason of heat in his Liver, was a little troubled with Pimples in his Face; who, being about to Marry a second time, drove them in with some Medicines: A little while after he was taken with the Gout, then with a Pallie in both his Arms, and in a short time he died.

Ph. Salmuth,
cent. 2. obs.
35.

VIII. Sometimes redness of the Face comes from abundance of blood, that is carried by the great vein, which is in the middle of the Forehead, and flushes on a sudden all over the Face, and strikes in again, but presently returns. An Illustrious Countess lent for me on this account, and while she was discoursing with me, the Blood immediately flushed out of that vein all over her Face. I observing that great vein in her Forehead to be full of blood, persuaded her to let it be opened. I ordered her hair to be shaven a little above the *commissura coronalis*, upon the vein, leaving a little hair on her brow, under the shaven place, that it might not disfigure her face, and I ordered a ruptory Medicine to be applied to the vein in the shaven place, and I told the Chirurgion, that he should not let it lye on above one hour, but he let it lye on two, and when it was removed it bloudied all the Chirurgion's face, the effusion was so violent; who ought to have pressed the vein from her Nose to the Wound, that the blood, which was in that part, might have been evacuated, and then should have applied a defensative upon the place. But he being affrighted, immediately stopt the Wound, and bound it, and the blood, which was in the foresaid place, fell down to the Nose, which swelled upon it, but was cured by applying a Plaster. When the Wound was cured, and the Vein, that was absconded, stopt, she was free, and her flushings vanished.

Bayrus,
Præf. l. 7. c.
2.

IX. Whether are *Spaw*-waters good for a red Face, and for pimpled and copper-nosed Drunkards? I Answer, Because these Pimples, or Pustules, do for the most part depend upon immoderate heat of the Liver; and these Waters do greatly heat the Liver, as is evident in Hydropicks, Cachecticks, and such as labour of the Suppression of the *Menstrua*, whose Liver is acknowledged to be cold, and we have seen abundance of people cured by heating it with these Waters; it is certain, that if any Man drink these Waters any considerable time, he will go away from the *Spaw* with a far redder and more Pimpled Face, than when he came

thither, as I have observed in several. But because these Pimpled Drunkards do always, in a manner, from the adusion of their Blood in the Liver, contract an obstruction of the *Melaraick* vessels, sometimes more, sometimes less, they may safely drink the *Spaw*-waters about ten days; namely, that when the obstruction is removed by these opening Wells, the Liver may be reduced to its temper by the help of cold things.

Heer, p. m.
156.

X. Our business must be to carry off by the Centre; for to drive out the excrementitious humours of the whole Body to the circumference, by Hydroticks, in a particular, not an universal cutaneous Disease, does appear to me not very proper. For the crusty affection, which seizes a peculiar and ignoble part, may become universal all the body over.

Fortis.

XI. There are two constitutions of Diseases, one whose essence subsists *in facto*, not depending any more on a preceding cause: From this, as also from the procatartick cause, no indication for remedies can be taken, because it is vanished. Another, whose Being depends upon the generation of a preceding and efficient cause: As the venom communicated by the bite of a mad Dog, and diffused all over the habit of the body, lies hid a long time, till it have infected the nature of the Heart and Bowels, then the canine madness quickly shews it self in the Hydrophobous. In like manner the impurity of the menstruous blood, of which the bowels of the *Embryo* are concrete, that the *fatus* may be nourished with the purer part of it, lies hid several years within the bowels, till by its contagion and ebullition with the blood, it produce the Small Pox and Measles. Hence it is manifest, that those Diseases, whose Being does not any more depend upon a preceding cause, and whose matter does not any farther lye deep in the body, mixt with the blood in the heart and veins, but is entirely cast out to the external habit of the body, by the strength of Nature, neither stand in need of Purging nor Bleeding, unless some portion of the Matter, or disposition contrary to Nature, do still remain in the body. Wherefore, *Hippocrates 1. aph. 20.* advised well. Things that have had a *Crisis*, and that have had a good *Crisis*, we must neither meddle nor make with them, either by Purges, or by irritating them any other way, but we must let them alone. And we find these entire excretions of the noxious humour, do, for the most part, happen in such Diseases, as arise with an ebullition of the blood, such as a Fever with *Buboes*, an *Ephemera*, the Sweating Sickness, *St. Anthony's Fire*, and children's *Exanthemata*. And it is manifest, that this ebullition is made in the blood, as in Juices and new Wine, by reason of watry and crude, or putrid Excrements. For since three kinds of Excrements are contained in the Juices of all natural things; one Earthy, which in Wine is the Lees; another Aërial, which answers to the flower or top of the Wine; the third, Watry and crude, which fermenting by time and heat, causes an ebullition in the humours and juices. Thus, since Children's bowels are nourished by, and concrete of the Mothers blood, which, because of Womens idle living, and the weakness of their heat, is more watry and less concocted than it should; Who is there, that does not think, the tender body of the Child must be infected with the contagion and filth of it, and that it must abound with superfluities? Which things, when they grow hot in the mass of blood, or in the heart, with a febrile heat, then Nature, like working Muff, throws off these dregs to the external parts of the body, where they become *Exanthemata*. Thus also the blood in the Liver or Veins, fermenting, with the Putrefaction of either Choler, expells its filth to the ambit of the body, whence come *Buboes* in the Groin, and *Erysipelata*, *Serpigines*, Carbuncles and Inflammations in other parts. And when

when the Body by a *Crisis* is perfectly purged of noxious humours, which the Urine, the *Serum* of the blood, being made like to healthy peoples urine, does indicate; then it were needless for us to purge the blood, either by bleeding, or a purgative Medicine, but the said *exanthemata*, relics and symptoms, might then rather be easily cured by outward remedies, or fomentations. Like as in that long Plague, which raged at Rome in Galen's time, "In those, saith he, *Lib. 5. Meth.* who were to escape death, black Pustules, which they call *exanthemata*, broke out thick all over the body: And it was clear to any one that saw it, that this was the relics of the blood, which had putrefied in the Fever, which Nature had cast out to the skin like ashes; But, saith he, there was no need of Medicines for such *exanthemata*, because they went away of themselves. Thus also I have above an hundred times seen an Itch, and *odemata* in the Legs, that have risen after a *Crisis* of other Fevers, but especially of Quartane-Agues, go away of themselves, without any help of Medicines. But if then either blood had been let, or a Purge given, there had been great danger, lest by those veins, whereby the matter of the disease had been driven out, it might have been drawn back again to the inner bowels: For a hungry Stomach can fetch back the Aliment transmitted to the bowels and limbs, by the same ways, and can draw other humours out of the bowels into its cavity. But since this foul asperity of the Skin, vulgarly called the Itch, does arise of impure chole-ric blood, or adust or *sæculent*, mixt with the liquor of salt Phlegm (such as the Liver produces through its dyscrasie, or often of meats and drinks of a bad juice) which Nature does not throw off all at once, but by degrees, with the Aliment of the body, without any ebullition of the blood, to the parts of the body, and infects and alters them with its contagion, whence it comes to pass, that the successive regeneration of it depends not onely upon the dyscrasie of the Liver, as upon an internal antecedent cause, but oftentimes upon an obstruction of the Spleen, whose office it is to purge the blood, and upon the contagion of the Parts; Therefore here it is necessary, not onely that the blood be purged, by opening a Vein, and giving purging Physick frequently, but also that the intemperature of the Liver, and obstruction of the Spleen be corrected and opened: And then, after the Body has thus been well purged, it will be worth the while, to dry the habit of the Body, also with Sudorifick Potions of Treacle, or Sulphureous Baths, or with Ointments made of Mercury; and so you may rid the outer parts of the Plague of this infection, which they had taken. And seeing the Pustules and Itch of a new Pox have commonly a great affinity with other *Exanthemata*, which the remedies common to them both do argue; and since, beside the external causes of contagion, both of them depend upon the internal infection and filth of the corrupt blood and humours; Who, I pray, even after the Pustules are driven out to the *Superficies* of the body, will deny, that evacuation of blood, by Phlebotomy and Purging, is of great moment in the cure of either of them?

XII. *Angelica N.* had been several years troubled with blackness in her fingers, with a little corruption and parting of the Nails. She was of a cold constitution, heavy and dull. The blackness was taken away by Tobacco smoak, and Ointment thereof, for that year: But when it returned the next, it was quite taken away with a fume of Cinnabor; so that it never came again.

XIII. Sometimes Sweating of the Feet does miserably torment Women, which they endeavour to stop: For which Disease I can easily tell them a speedy remedy; namely, if they put some powder of Myrtle in their Linen Socks. But let them have a care they do not fall into worse diseases, as I have

often seen. This excretion preserves from many Diseases, and should rather be promoted than checked. ¶ A Noble German, following the Count of the most Serene Prince, advised with a Physician about the sweating and stinking of his Feet. The Physician orders him to wear Socks dipt in Red-wine, wherein Alume was dissolved, and prescribes him Pills of Aloes and other things, and an Electuary of drying and diaphoretick Medicines, which might keep the body safe from putrefaction and superfluous humidity. The Socks gave great and present help; for the Soles of his Feet were so thick, that no sweat could get out afterwards: But the Pills and Electuary did not answer the Physician's end; In a few Months some small faintings and unusual giddiness followed. The Count of the most Serene Prince came to Geneva in the year 1674, and he desired a remedy of me for these troublesome and dangerous Symptoms. This Noble person was not against such things as might reduce him to his former state. Universals premised, two Issues were made in his Legs: His Feet were washed for a Month in a *Lixivium* made of deterfives and softners: He walked much, and by these means his former *effluviu* being recalled, his dreadful Symptoms ceased.

XIV. Vulgar Physicians debar every contumacious pain, that afflicts any part of the body, without inflammation, the help of bleeding; because, as they say, these Diseases come of a cold cause falling from the brain; To which cause they subject not onely the said pains, but also all Chronical Coughs, concerning all which things, the Physicians think they have satisfied their enquiring Patients, when they have told them, that the remedy proposed can by no means be convenient for them, but they must onely purge and keep a low diet, and such things. But that both the Physicians and Patients are deceived, the thing it self and examples do shew. Mr. de Varennes 75 years old, had a continual lingring pain in his neck and shoulders for many Months, which the Physicians endeavoured to cure by giving of Purges, and applying hot Ointments: By which, when he found small benefit, I told him, I thought Bleeding would doe him good; He on the contrary objected, that he never used to be let blood, that he was old, the Winter was beginning, that the Disease came of cold humours and wind. But he was forced at last, by the increase and continuance of his illness to admit of Blood-letting. I ordered 10 ounces of blood to be taken out of the Arm on the side affected: And in a few days a like quantity on the opposite side, with great benefit; and then again out of the other, and so he was cured. Yet in the mean time we did not neglect the use of Purgatives, and hot and discutient Unguents. In such another contumacious pain in the neck, with a heaviness of his head; when the Physicians endeavoured in vain to cure the Reverend N. by Purging and other remedies, I cured him, by thrice bleeding him a pound and an half at a time, contrary to the expectation and consent of other Physicians. Therefore, in cold Diseases, or such as we think to be cold, to abstain from bleeding is not always good, but sometimes hurtfull. And in contumacious Diseases (although they come of cold matter) it is not the part of a prudent Physician utterly to abstain, or to bleed less than is proper: Seeing it is certain, that every part of the body is nourished by that matter which is in the veins, which the colder and thicker it is, the Disease caused by that matter must needs be rendred more grievous and contumacious. Which matter, we say, ought partly to be abated by bleeding, and partly by purging and a thin diet, to the end that when the mass of blood is purged and renewed, the Disease may be cured.

I. **T**His is a dangerous Diſeaſe, for the poſſeſſion of life, the blood, is waſted: Wherefore here is need of a ſpeedy and ſtrong remedy, ſuch is Venæſection. Galen let blood in a young Man, who, having got cold in his Breſt, ſpate blood. Aretæus is of the ſame judgment; "If, ſaith he, the veins be diſtended with blood, one must be opened in every profuſion of blood, whether the blood come by breaking or eroſion. It is good alſo when rarefaction is the cauſe, left a Vein be broken with the Abundance. "Yet if, ſaith he, the Patient be lean, and ſcarce of blood, do not open a Vein. Trallianus alſo prudently adviſes; "We must by all means, ſaith he, bleed in the Arm: But when they ſpit out blood by eroſion, avoid bleeding, for ſuch Mens bodies are dry, and inclinable to a conſumption.

II. Galen. 5. meth. c. 8. opens the inner vein of the Arm, and he opens it again the next day. Trallianus, l. 7. c. 1. ſays, He did more good by bleeding in the Foot than in the Arm; becauſe the revulſion is ſtronger. Meſue and Avicenna, for prevention, open the Saphena; for the cure, a vein in the Arm, and they doe well: For when the matter is fallen upon the Breſt, and is ſtill plentifully falling, ſo that an inflammation may be feared, a vein opened in the Foot brings help too ſlowly, therefore we must bleed in the Arm. If the blood come from the Liver, we must bleed in the right Arm, according to Archigenes: If from the ſwollen Spleen, in the left Salvatella, as alſo in the ſame,

if it come from the Breſt and Lungs without violence. But in Women, we must have reſpect to the Menſtrua, the freedom whereof bleſſes them with many conveniences. And here we must uſe diſtinction. When it comes at the ſet time, it is good, and it is ſcarce raiſed at another, if the Menſes be at hand in a hæmoproick Woman, be they ſuppreſſed or not, bleed in the Saphena: So the Phyſician, Nature's Servant, will help her, by drawing the blood to the Womb; whither belongs Aphor. 5. 32. If the time of the Menſtrua be aſar off, there is need of diſtinction, for if there be ſigns of blood being gathered about the Womb, and it does not as then fall with violence upon the Breſt, let blood in the Foot. If it fall with great violence on the Lungs; and beſides, if abundance of blood be contained in the veins of the Womb, the upper and the lower veins both must be opened. But when the flux of the Menſes is at a diſtance, a vein must firſt be opened in the Arm, which being opened, will give preſent relief, and cannot be expected from bleeding in the Foot.

Sennertus.

III. Hippocrates, lib. de Humor. ſays, there are three things that hinder blood letting in them that ſpit blood; The time of the year, a Pleuriſie and Bile. For a Man might think that blood might be ſafely let as often as the Spitte appears bloody, ſince thereby it appears, that the Diſeaſe comes of blood, and that a tranſmutation is not as yet made, which ſhould hinder bleeding. The firſt impediment is in the Summer ſeaſon, at which time the Ancients abſtained from letting of blood for ſeveral reaſons, but eſpecially becauſe the blood at that time is thinnest, and next to a bilious humour: Wherefore ſince it is yet farther attenuated by bleeding, there is danger, left by continuance of the Summer's heat, all the blood be turned into bilious juice. Moreover, at that time Men's bodies evaporate, and waſte much with the ambient heat, ſo that they ſcarce ſeem able to bear bleeding. And if it may be feared in all Diſeaſes, much more may we fear it in this: For ſince it is very likely, at that time the fault of the blood conſiſts, not in the great quantity, but in the bad quality, which makes it thin and ſharp, its excretion muſt of neceſſity be increaſed rather than diminished, if it be farther attenuated by letting of blood. Which reaſons indeed, the more they prevail, while Bile has dominion in the body (which was the ſecond impediment) ſo much leſs ought blood to be let; not onely in ſpitting of blood, but alſo in any other Diſeaſe, that has its original from Bile, or takes a Man, who abounds with Bilious juice, ſo that it is no wonder, if Hippocrates never durſt open a Vein in Bilious Perſons.

Martianus,
 comm. in cist.
 locum.

IV. If ſtrength or age admit not of Bleeding, let Cupping-glaſſes be applied to the buttocks, loins (if blood do not proceed from the lower parts) or to the hypochondria, not to the breſt. If from the womb, to the lower parts. They that apply Cupping-glaſſes to the liver or ſpleen without Scarification, ſometimes doe their Patients good, ſometimes harm. For if a Vein have been broken in thoſe parts by a blow or a fall, and Nature caſt the blood out thence by the mouth or noſe, if you hinder it, you will cauſe a great inflammation in the bowels. But if a Veſſel were onely opened, and not broken or eroded, then Cupping-glaſſes may ſafely be applied.

Heurnius.

V. In Spitting of blood, which is cauſed by ſalt Phlegm falling from the head, a Cautery may be made in the coronal ſuture. I do not approve of it in the Arm, for ſo the matter might be drawn down from the head.

Bernardinus
 Paternus.

VI. When Women ſpit blood, Avicenna, lib. 3. ſen. 10. tr. 3. c. 6. orders the menſes to be provoked: The blood, ſaith he, is inclined downwards in Women, by provoking the menſes in their hour. But he muſt be underſtood of that provoking of the menſes, which

which is caused by means of frictions of the lower parts, applying of Cupping glasses, and Bleeding in the *Saphena*, not of that which is caused by taking internal Medicines. For otherwise he would contradict himself, because he forbids such Patients menagogues, with which the blood grows hot and thin, ferments, and is rendered sharper.

VII. *Hippocrates*, 6. *Epid.* sect. 3. l. 44. says, the Season of the year, a Pleurisie, Bile, are each of them an impediment in them that spit blood. *Galen* expounds it, as if these three things hindered Bleeding, namely, the Season of the year, because near the Dog-days we abstain from Blood-letting: Bile, because Venæsection is naught for bilious persons: A Pleurisie, because if this and Spitting of blood be complicated, blood must be let according to the rules of a Pleurisie, not according to the rules of Blood-letting. But this exposition is erroneous; for we both let Men blood in the Dog-days, and when they are choleric: And, besides, are not many Hæmorrhagies wholsome in Summer time? And grant, that Bile is enraged by letting blood, this may only serve to caution us, that, where Bile offends, we let blood sparingly. Upon account of the Pleurisie a Vein may be opened on either side, without any lett, and we may cure the Spitting of blood aright. *Vallesius* is in the right, who understands this Impediment not to hinder Bleeding, but the Cure simply: As if *Hippocrates* should have said, When any one is ill of Spitting of blood, the Season of the year, either very hot or very cold, is an Impediment, that he cannot so well be cured; because an excess of either Season, heat or cold increases Spitting of blood, Cold breaks, Heat makes lax. Then Bile requires the taking of Purgatives, which are aperient and irritating. And, lastly, a Pleurisie cannot otherwise be cured, than by expectoration, and nothing is better for Spitting of blood than quietness of the breast: And *Galen* himself acknowledges as much, 1. *Aphorism.* 16. Spitting of blood, saith he, and a Pleurisie, stand in need of a contrary Cure. Moreover, where as Spitting of blood is caused either by *Anastomosis*, or by *Diæresis*, or by *Diabrosis*, or by *Diapedesis*, these 3 Impediments hinder the Cure of them all. First, a hot time of the year hurts an *Anastomosis*, as also it may hurt the Flux, which comes by *Diapedesis*, all the passages and mouths of the Veins being made lax, and the blood sharp and hot. Cold hurts a Flux by *Diæresis*, 6. *Epid.* sect. 3. l. 14. For Cold breaks the Veins and provokes a Cough, the Cough also breaks them by Concussion. The second Impediment is Bile, which by its corrosion hinders the Cure of the Flux of blood by *Diabrosis*; for what Cure can there be where the Cause still is, that augments the Disease? The third is a Pleurisie, which, if it happen with Spitting of blood, gives and receives an Impediment, so that the one cannot be cured without the other. I do not here speak of Spitting of blood, which appears in a sanguineous Pleurisie, as yellow Spittle does in a bilious one; but of a Patient first taken with a Spitting of blood, and afterwards with a Pleurisie. These two Diseases mutually increase and hinder one the other in their Cure: They increase one the other; for a Pleurisie causes a Cough, which hurts them that spit blood: Again, Spitting of blood makes the parts in the Breast weak and easily susceptible, whereby the Pleurisie is furnished with greater store of matter: They hinder one another in Cure; for a Pleurisie cannot otherwise be cured than by Expectorators, as *Oxymel*, otherwise there is danger of Suffocation by keeping the Spittle; which cure is contrary to that which is proper for Spitting of blood, for which quietness is altogether proper; nor may the Cough be stopt, though it may break the Vessels. Here the Physician is at a stand, and *Galen*, 1. *Aphorism.* 16. says, he must take care of that which is most urgent. But I would offer

him a Patient in whom both Maladies were extreme urgent, whose Spitting of blood endangered his bleeding to death. And if the Pleurisie were not purged, there would be danger of strangling: Here a Physician would not know what to doe. While I was considering with my self this Difficulty, it came into my mind, that both Cures might agree sometimes, namely, if the matter of the Pleurisie be still crude and thin, if the Blood also sweat through because of tenuity, or make its way by its Acrimony; for then, both the Pleurisie, and the Spitting of blood, require incrassating things. The Pleurisie indeed, that it may easily be raised by Spittle, because it is brought up by impulse, to wit, by Cough, which is done more conveniently, where some resistance is: for a thin humour, when it is raised, is divided by the breath, and falls back in coughing: And Spitting of blood, if it come from tenuity and acrimony, could be moderated no way better, than by thickning it. But if the matter of the Pleurisie stick; not through thinness, but viscidit, then, because we must needs hurt the Spitting of blood in curing the Pleurisie (for we want Incisers) it must be done moderately, and not without giving the Prognostick first: For here the case is almost deplorable; yet not so as that the Patient should be given over, and left to the Prognostick.

Strp. Rod.
Cair. de
Complexu
morb. 6. c. 22.

VIII. The Difficulty is, at what time we should use things to dissolve clotted blood, for they open the Vessels, not shut them. Therefore we must consider, whether the violent Bleeding or the Concretion of the blood be more violent. If there be a breach of the Vessels of the Lungs, or fear of Inflammation; or if the blood come violently, it must presently be stopt; but when it is partly stopt, that is, when the Blood does not come so fast, or its colour is not so florid, things to dissolve the grumous blood are proper, after which we must proceed to glutinating things, or to such as consist of both, that is, *Oxymel* and Syrup of Purslain with Bole-armenick. But if Spitting of blood follow the breaking of the Vessels of the breast, because from thence there is no danger of a Consumption, the Blood must be dissolved and discharged before agglutination. There must be the same method, and we must endeavour the dissolution of the concrete blood, if it come from an *Anastomosis* of the Vessels of the Lungs, for there is no fear of an Inflammation. *Aretæus* advises that those things which are given, must be tenacious, to the end Concretion may succeed. Among such things Hare's Rennet is commended, which must be given sparingly; for a great deal of it is mortal, as the same *Aretæus* says.

IX. Grumous blood must be dissolved in the beginning, lest glutination be hindered, which may be done by taking three or four ounces of warm *Oxycrate* twice or thrice a day. But it must be so made, as that it may be pleasant to drink, lest too much Vinegar cause a Cough. If this will doe nothing, we must proceed to stronger things, as Rennet of Hare, Kid, Crabs-eyes, Mummy, *Sperma ceti*, *Antimonium diaphoreticum*. These things must be given at the beginning, if it come from an *Anastomosis*: But if from Rupture, the Flux must first be stopt, for it is more urgent than Concretion, and then the Blood must be dissolved.

X. *Galen* and *Ætius* allow *Posca*, onely *Averroes* condemns it; because, seeing it is made of Vinegar diluted with Water, upon account of the Vinegar it is hurtfull both for the Cause and the Disease, it raising a Cough and increasing the Fluxion by extenuation of the blood. Indeed, before the blood congeals into clods, it must not be used, lest we run hazards. But when it is clotted, and mortal Symptoms are imminent from it, upon account of the urgency it may be given, if there be no Cough, in respect whereof it is better to use Rennets,

M m

Treacle,

Treacle, *Diacurcuma* with Scabious water, and a Decoction of Maiden-hair, &c.

XI. If Blood be not stoppt with Astringents and Glutinants, we must flye to Narcoticks, which in-crastrate thin humours, and cause a sleep, which stops all fluxions. For Experience has taught us, that Pills of *Opium*, made for the purpose, never hurt any one, if so be the quantity were accommodated to every ones Nature, and not given but to strong Constitutions.

Idem, Meth.
l. 2. c. 8.

XII. If Blood retained in the Lungs by the use of Astringents begin to putrefie, give opening and dissolving things, that the black and filthy blood may come out, and afterwards the part may be cleansed, and cured by glutinant Medicines. ¶ When a Patient spits blood with his Cough, two Indications are urgent, for through necessity of respiration the Wings of the Lungs ought to expand themselves, wherefore there is need of expectoration: But effusion of blood forces us to endeavour astringent of the breast: *Syrupus myrtinus* has a certain admirable property of answering both these ends: Syrup of Purslane may be added, to thicken the blood.

Galenus.

W. Wedeli-
us, Misc. cur.
an. 1671.
obs. 43.

Fallopianus.

XIII. All Astringents contract and close the passages; and, besides, they knit and bind the substance of the parts, that stick one to another: and they doe this more or less according to the quantity of Astringent. But by astringing and condensing the outside of the body, which they astringe, their virtue is shut out, and hindered from going deep in. For which reason some Physicians have curiously contrived to put other subtle and sharp Medicines into such as these, whereby the virtue of Astringents may be carried deep into the body: But when the Bleeding happens in places about the Stomach or Belly, or Guts, there is no need of such a mixture of Medicines.

XIV. Concerning a methodical Cure, *Galen's* advice, 4. m. m. and 7. de comp. med. K. T. to wit, that both hot Medicines and of thin parts must be mixt with Medicines for Spitting of blood, that the astringent Medicines may better be distributed: therefore he advises to mix Honey. He has a mind to intimate, that Medicines earthy and of a thick substance, which onely stop, breed anxiety at the Heart, and difficulty of breathing, must not be given; but such as leave the motion free to the Air, and check the effervescent blood.

XV. Concerning Spitting of blood, I will tell you what I observed while I was in *Tuscany* at the Baths called *Villanæse*. I say therefore, I saw several cured of Spitting of blood and preserved from a Consumption by drinking of those Waters: but I observed one thing worth the notice, which is, that they who drank the Water for Spitting of blood, and presently voided the Water by stool, their drinking it did them no good: But they that kept it three hours, and then voided it, not by stool, but by urine, it did them much good. Whence I gather, that unless the Water pass by the Veins, it does no good for Spitting of blood, nor preserves from a Consumption: And that it may pass by the Veins, it is required, that it pass not presently.

XVI. That the aperture of the Vessel may be closed, Astringent and agglutinant Medicines are very proper: The chief of these is usually given in form of a *Linthus*, so that in swallowing them, some particles of them may fall upon the *aspera Arteria*, and more immediately communicate their virtue to the part affected. But this way of energy seems not to be of much moment, because the efficacy of these Medicines does especially and in a manner onely reach the seat of the Disease by the communication of the blood. Wherefore not onely *Eclegmata*, but also Decoctions, Powders and Pills, of Traumaticks and Balsamicks, are beneficially prescribed.

Willis.

XVII. In Spitting of blood, and in those Diseases where we want astringent and strengthening, spirituous, attenuant, aperient and sharp things are suspected: But in-crastrating and earthy things, which do not consist in the spirituous part, but in the very matter and corporeal substance, seem necessary. Wherefore if Corals doe any good in such cases, they doe it by their earthy corporeity, whereby they moderately cool and astringe, and perhaps moreover by some occult quality, which yet without doubt adheres to the whole substance. Entire and substantial Medicines, if you separate them from their proper body, do often put on an aliene and far different body, and so what before did good, do now cease to doe good, or even begin to doe harm.

Fr. Ign.
Theismuir.
conf. 4. lib. 2.

XVIII. Hence we may give a judgment of Tincture of Corals, in which Artists in Chymistry think that virtue is eminently vigorous, which is attributed to the whole Coral, that is, while the pure being separated from the impure and its dregs, does far more easily exert its virtues. Now *Dioscorides*, l. 5. c. 97. assigns to it a virtue moderately astringent, cooling, and of great efficacy against Bleedings. But concerning its Tincture, hear *Ph. Grulinius* his opinion in *suo Florileg. Hipp. &c.* par. 19. c. 3. In the preparation of Coral, Pearl, and pretious Stones, let every one have a care he be not deceived, and reckon he has the true Tincture, when he has onely a false and aliene one, or that he has obtained the *menstruum*. For there are some Tinctures, as of *lapis Lazuli*, which in redness may vie with Tincture of Corals: And there are some *menstrua* that grow red of themselves: Thus some do not blush to give Spirit of Vitriol tinged with red Roses for the coralline Tincture. Although therefore the Tincture of Corals, so called, often have a colour red enough, and the Coral be left in the bottom white; yet it acquires this colour either from the Salt of the Vinegar, as *Sennertus* will have it; or from the sulphureous part of this Salt, which easily joins it self with the Spirit of Wine, by reason of its cognation, as appears in the Tincture of Salt of Tartar, or by long Digestion, by benefit whereof many *menstrua* grow red; and the Corals, which after extraction appear white, do in a little while after receive their red colour, nor had they lost their inner colour; yea, the same Tincture may be made of white Coral and Crabs-eyes with the like *menstrua*. It must be observed besides, that in the common solutions of Corals Spirit of Honey is taken for the *menstruum*, which by its acrimony dissolves Gold a little: Therefore I cannot see, how this coralline Liqueur, whatever it be, or any other like it, consisting of Spirit of Wine, Salt of Tartar, Vinegar and the like, can doe good: For for the most part they answer not the intentions, they do not contemper, nor astringe, nor consolidate, nor stop blood; but they make thin the humours, sharpen, open, and now and then taken largely and inconsiderately they inflame, cause thirst, and by their acrimony do not a little offend the parts which they immediately touch. You may add to all, the mischievous avarice of the Apothecaries, who, to increase their Tincture of Corals, mix the Corals with Sugar in a Frying-pan, and rost them to redness, then by digestion they dissolve them in some *menstruum*, and draw not so much a Tincture of Corals, as of roasted Sugar.

Idem, ibid.

XIX. Blood is stoppt by *Scaliger* and *Hæurnius* their Powder, the Ingredients whereof are Seed of white Popy, white Henbane and Bloud-stone. But the use of it must not be long continued, because of the Henbane-seed, which is very hurtful.

Frid. Hofmannus, m. l. l. c. 21.

XX. Some, as on experience, do recommend Nettle-juice in the morning for several days: But there are not a few things which render the truth of this suspected by me, and though the kind, of which

which there are several, be not determined, I believe it is the common stinging Nettle that is meant: But, 1. This is of very subtle parts and of a digesting nature, wherefore, according to *Dioscorides*, it opens, moves Urine, and egregiously forces Women's obstructed *menfes*. 2. Taken inwardly, it is of a sharp, absterfive, titillating quality. 3. The Seed is in frequent use for raising of thick and viscid humours, yea, even of *Pus* in an *Empyema* of the Breast. 4. It and its Seed, according to *Galen*, has some flatulency in it; and is said to stimulate *Venas*. If the Nettle therefore be of such subtle parts, as to open, force the *menfes* and urine, by titillation to give a stool, by its sharp flatulency to provoke lust, and if the Seed for its excessive heat be reckoned among eroding things, how can the drinking of 4 ounces of the Juice for several days one after another doe good in this case? But I think it is good for hæmoptoick and empyematick persons, namely, that the extravasated blood, coagulated in the Breast of them that have been long ill, or turned into *pus*, may be timely deterged and expectorated. Wherefore I cannot say, it is probable, that the Juice of Stinging-nettle does good in the beginning for Spitting of blood, as a peculiar Remedy that stops blood.

Thiermair,
ubi supra.

XXI. In other cases Linseed-oil is commended to be of great virtue, as in a Peripneumony, Phthisick, Colick, but especially in a Pleurisie, according to *Gesner*, 1. Ep. 49. I, faith he, have several times experienced, that there is nothing better in these pleuritick Pains than to drink Linseed-oil, and this presently eased respiration, and promoted spitting. Therefore it is carefully faved among us clarified in the Sun, which clarifying is better than that which is made by *lixivium* or a roasted Onyon. By anointing their Belly therewith, or by covering it with a linen cloth wet in it, they make the Belly loose, but I no where observe that it does good for Spitting of blood. Yet in the beginning of the year 1675. I often visited a Woman fifty years old, who had her *menstrua* a long time, not largely, but continually, and then she was troubled with a grievous catarrh, of which, by my advice, she was cured with a Decoction of Ground-ivy, Chervil, Lungwort, Woodbine, Liquorice, &c. Once, early in the morning, I was called to her, I found, to my amazement, she had voided above a Pint of florid blood, such as usually comes from the Lungs; she had spate it up between 4 and 5 in the morning; I immediately ordered a Vein to be opened in the Arm, and I gave her some drops of the Tincture of Blood-stone, in *Syrupus de Symphyto Fernelii*: But her Spitting of blood returned again towards night, the Patient refusing to take any thing, Linseed-oil came into my mind, which pleased her, she took one spoonfull, and by continuing the use of it for several days, she recovered. I believe the Spitting of blood arose from some Vein broken in her Lungs, which was healed by the balsamick and emplastick virtue of the Linseed-oil. I tried it in others afterwards, not without success, giving first the Tincture of Blood-stone.

XXII. Starch is good, because emplastick, because it stops the gaping vessels, and thickens the humours, for it is the Juice of Wheat, first steeped in Water, and then strained out. But we must abstain from that which is made of Bran steeped in Water and strained out, for such is rather opening and absterfive. The worst is that, which, to make it white, has Lime mixt with it, because it is inflaming and opens rather than shuts the mouths of the vessels.

Riverius.

XXIII. I have cured several of Spitting of blood, before they fell into a Consumption. The Cure was such as is described by *Galen*, 1. 5. *Meth.* this one thing added, I applied linen clothes wet in Juice of Plantain to the Kidneys, by which means I cured a Man almost seventy years old, who had voided above ten pounds of blood.

Cardanus.

XXIV. If the Blood be very watry and serous, as it usually is in all Hæmorrhagies; when the Spitting of blood is stoppt, 1 scruple of Powder of Rheubarb is convenient every day in the morning, an hour before break-fast: For thus the blood, when the serous humours of it are purged by degrees, may recover its pristine thickness: Or one drachm of Rheubarb may be taken once a week. Otherwise all Purgatives in this case must be avoided. ¶ When all things are done, as to revulsion and interception, we must proceed to evacuation of excrements. And though *Galen* gave strong Purges, yet it becomes us to be content with immature Rheubarb, and shells of citrin Mirobalans and *Cassia*; Yea, onely with *Cassia* and Pulp of Tamarinds, till the Ulcer be perfectly healed: For otherwise there would be danger, lest by the agitation of the humours the blood might burst out again, and the Ulcer might contract an Inflammation from hotter Medicines.

Casalius
in Catoptra
Art. Med.
1. 6. 16.

Fortis, conf.
15. cent. 22.

XXV. Stopping of the blood must not be attempted with very astringent things, when it is voided in abundance by the Throat. For by the use of them and coagulating things, it congeals out of the Veins, sticks by the way, and so uses to choak a Man out of hand.

idem, conf.
25. cent. 24

XXVI. Blood, whencesoever it comes into the *aspera Arteria*, that it may not coagulate there, and then corrupt, must immediately be kept dissolved with convenient Medicines, or must be dissolved again, and voided. To which purpose Crabs-eyes with *Antimonium diaphoreticum* must be preferred above many other Medicines, dissolved, in part at least, in a little distilled Vinegar, and taken with the addition of gratefull things; for in this case they perfectly doe the work; for example, Take of Water of Hyssop, Fenil, each 1 ounce; *Aqua vite Matthioli* 2 drachms, distilled Vinegar half an ounce, Crabs-eyes half a drachm, *Antimonium diaphoreticum* 1 scruple, Syrup of Maiden-hair 1 ounce. Mix them. But in such mixtures that have Crabs-eyes dissolved in Vinegar in them, we must have a care we add not Syrups made of mucilages, such as *de Althæa Fernelii*, *Jujubinus*, of Violets, and the like; because either immediately, or in a little time they grow thick as mucilage, and unfit for use, which they will not so easily doe, if Syrups made of aromattick things be made use of, especially new, for several in tract of time grow viscid.

Sylvius de le
Boë.

XXVII. When from the proper affection of the Lungs either pure blood or corrupted and turned into *pus*, is voided; there is great danger, wherefore we must make the more haste to cure it, lest the opportunity be lost by procrastination: For the singular substance of the Lungs is easily infected and corrupted, but is difficultly restored. We must not desist therefore from the use of Medicines, that cure the flux of blood out of the broken vessels of the Lungs, and the corruption of it, till the Disease be perfectly cured. Nay, I should advise, that for some time after the Disease were cured, as to appearance, the Patient should continue in the moderate use of gentle Medicines, to the end that the part once affected, and therefore again liable to be affected, may be strengthened against the coming of the Disease anew.

Idem

XXVIII. But like as always in other cases, so here also we must take diligent notice of Medicines that are most agreeable to every individual, that such may be preferred before all others, and the use of them may be continued, as long as they doe good. But as soon as they are observed not to doe much good, others must be substituted in their room, and the Patients health must be promoted by all means.

Idem.

XXIX. Spitting of blood with a Cough imposes on good Physicians. They are deceived by all the Signs, and think it comes from the Lungs, when it falls from the Head, or comes from the *vena aragosa*, by

M m 2

by reason of some evacuation being intercepted, and is expectorated. ¶ One had been troubled with much Spitting of blood for a long time, and could be cured by no Remedies. And he complained onely of something like a Lump of flesh, that stuck in his Throat. At length, when the Patient had mounted a mettlesome Horse, he was taken with so violent a Cough, that he voided a Leech by the violence of it, upon which he was quickly well. ¶ Many Physicians ask their Patients, Whether they find any salt or sharp taste in their Catarrh? If they say, No, they immediately pronounce, that the Blood cannot be spit out of the Breast and Lungs. But *Galen*, 4. loc. affect. 8. refutes them, saying, that many become consumptive, when the Spittle does not taste salt at all: Therefore it may so be, that a putrid matter, but not sharp, may purrifie the vessels of the Lungs and consume them by erosion, so that blood may be voided. ¶ *Præ-votius* observed Spitting of blood without Coughing, as if with a certain expiration: for blood of a temperate substance, is easily voided, and therefore without coughing, just as a distillation is carried through the cavity of the *aspera arteria* without coughing, the sides of the Artery not being irrigated thereby.

XXX. When *Spigelius* had healed up an Ulcer in a Girl nine years old, at the request of her Parents, a little while after she spate blood. He was sent for to advise: He made an Issue in the place where the Ulcer had been, and gave her a Decoction; and not onely preserved the Girl from a Consumption, but reduced her to a much better state: and she lived a long time. Therefore we must diligently consider the content of the Veins and Arteries.

XXXI. We must have a care, while we would doe good, that we doe not a great deal of harm: for *Galen*, lib. de const. art. c. 17. says, "I know they doe a great deal of hurt, who in such as cough blood out of their Lungs, apply astringent Medicines all over the Breast: for, besides that their virtue does not reach to the Lungs, they also drive the blood in the Breast to the Lungs". He thinks the same, lib. 5. meth. cap. 6. of cold things without astringent. Yet these passages must not be so understood, as if they could never be used; for after derivation or revulsion of the fluxion is made, they may be applied by *Galen's* own concession, in the same place, "Therefore, says he, I would not advise without difference, nor at all times, to apply cooling things about the part whence the blood flowes, till after you have averted it to another place". Also the application of astringents is hurtfull, if straitness or compression, or any difficulty of breathing accompany it.

XXXII. The course of Diet, as it must not be very spare, so by no means attenuating, but very incrassating: for Men are very much mistaken with *Erassistratus*, who think a spare Diet is proper in these cases, to the end the abundance of blood may be diminished, for so it is made more thin, bilious, turbulent and ever more ready for efflux.

XXXIII. One would think a cold Air should be avoided, both because by its violence some vessel is often broken in the Lungs, and because it may occasion a Cough, which may open the Vein farther. But in truth there is greater danger in a hot Air, because by dilatation it may augment the flux, and by the diuturnity of the flux the dilatation is greater: but the Cough, occasioned by the cold Air, may easily be stopt by holding ones breath: Nor does our domestick Air so much straiten by its Cold, as to endanger the breaking of any Vessels: because a cold Air is onely apt to doe that, when there is great plenitude in the body, which when taken away, there is no danger at all.

Medicines especially made use of by eminent Physicians.

1. For Stopping of blood, it is very good to dip the *Scrotum* in cold water.

Claudius.

2. The following Eleſtuary is admirable for the Stopping of blood; Take of Seed of Henbane, white Popy, each 10 drachms; *Terra sigillata*, red Coral, each 5 drachms; old Sugar of Roses what is sufficient. Mix them. Make an Eleſtuary.

Crato.

3. *Sealiger's* Hæmoptoick Powder; Take of burnt Ivory, red Roses, Bole-armenick, Bloud-stone, *Terra sigillata*, each 5 drachms, red Coral, Pearl not perforated, *Carabe*, each 2 drachms; Gum-arabick, Tragacanth, each 2 drachms; Seed of white Popy, red Roses, Mallowses, Purslain, Plantain, burnt Hartshorn, each 2 drachms; *Acacia*, Juice of Liquorice, each 2 drachms; dried Starch 3 drachms. Mix them. Make a Powder.

Deodatus.

4. A drachm of *Philonium Persicum* in Plantain and Purslain water given before meal, has done many good, in Spitting of blood, when no other Medicines would doe any; as also a Decoction of *Ju-jubes* cold, wherein hot Steel has been quenched. ¶ I gave one a drachm of Bloud-stone finely powdered, and it did him a great deal of good. I have also taken the same Stone finely powdered, washed much in Plantain and Shepherds-purse water, and then strained it, that the water might acquire redness, and mixt it with Syrup of Purslain and Myrtle, and so gave it for Spitting of blood. ¶ Syrup and Lohoch of Purslain are both very good for Spitting of blood.

Forestus.

5. This is *Hæstor de Manfredis* his Secret; Take of Germander, what is sufficient, bruise it, infuse it in Scabious water and Wine; then strain it, and drink it warm.

Goclenius.

6. I use every morning to give about half a drachm of white Popy-seed, with half an ounce of old Sugar of Roses, which Remedy I know has done a great deal of good to several.

Mercurialis.

7. This is an infallible Experiment, given at any hour, and at any time; Take the shell of a raw Egg, cast away the inner Skin, powder it: Take of this Powder 2 drachms, Plantain water 3 ounces. Mix them. And give the Mixture to the Patient, and you shall suddenly see it will heal. If you would have it work more effectually, you may give 2 drachms every day, five days together, with Syrup of Purslain, dried Roses and Myrtles, each half an ounce. Mix them.

Ben. Victor.
Faventinus.

8. This is an admirable Syrup; Take of Juice of Plantain and Vervain clarified, each two pounds: wherein let boil Gum-arabick, Tragacanth, Juice of Liquorice, each 4 ounces; Mumy, Dragon's blood, Bole-armenick, each 1 drachm and an half; Sugar of Roses what is sufficient; it is excellent for Spitting of blood, whence soever it comes.

Medicines.

I. **T**HERE is a twofold Consultation, first, Whether Blood ought to be stopt? which is the most difficult: The second, How? For all Bleeding ought not to be stopt, but some must be stopt, and some must be helped; some must only be let alone, because some is very wholesome, some pernicious. Certainly, if one bleed after a blow or a fall, there is no danger in stopping the blood: Wherefore we may use Astringents and moderate Coolers: Unless it happen that a Man is full, for then blood must be let, or we must suffer it to run in some measure. When the blood runs onely by reason of abundance, you have no reason to stop it: for, by letting it run, the abundance is abated, when that is abated, the Bleeding stops of it self: unless in the mean time some great Vein be broken, for then there will be need of an Emplastick and Astringent, such as Galen's Medicine, which is one of the best. When the Bleeding is because of some malignant quality, either alone, or with abundance, then the Physician is at a stand, because the case is either way dangerous; for if it be not stopt, by reason of the impotency of the retentive faculty, which the Irritation causes, it runs to faintness, especially seeing he that is very cacochymick, cannot bear any large evacuation, and quickly faints: If it be stopt, because the malignant blood cannot rest quiet in any place, it falls violently upon some inner part, which happens to be weakest, as it fared with an old Man, who, after he had bled abundance of thin blood (for he looked very greenish

in the face) and the blood was stopt by proper means, died of a Pleurisie. Therefore what must be done in so doubtfull a case? Surely, what Hippocrates, 6. Epidem. sect. 3. advises, When you have let it alone a little, you must incrassate drily; and about the part you must use a white and dry thing, it may be, Galls and Alum in Powder. He says, you must let it alone a little, that is, we must not presently stop it, but let it run a little. Certainly for what cause soever, even an external one, the Bleeding begins, it must be permitted a little, before you stop it: For Blood-letting is good not onely for a Plethory, but a little for a Cacochymie, a Blow and a Fall, and we are willing to have the blood run a little in any green Wound: But as in Cacochymies blood must be let sparingly, because they have not wherewithall to support it, so also spontaneous Bleeding must be let alone a little. If therefore you see one bleed, where signs of a Plethora are, let him alone till the Bleeding stop of it self, though the Man should faint. But if a Man bleed who looks pale and green, or pale, or pale and black, have a care you let him not bleed much, or till he faint; for it is very dangerous for such Men to faint. But if you suffer it not to run much, how will you hinder it from falling upon some part? Surely by Incrassating drily. Which I explain thus; It happens that People are in danger two ways, by abundant Bleeding, and by a slow and small Bleeding: For I knew a Woman who continually bled drops of blood for above six months, and while she tarried so long a time for help, but found no benefit by all the Physicians did, she died. We must therefore cure them both in the same method, those that bleed much, and that bleed little, except what the different indications do require. And one difference of indications here is that which is common to all other Diseases, that quick Diseases must be quickly cured, and others more slowly: Beside this, there is another difference in the manner of Cure: For where the blood comes by little and little, I can by no means think it must be let alone, to run by little and little, but rather that that blood should be taken from the Arm or Leg, as other things do indicate, by opening a Vein, which would have come away, had you let it alone; because if you let it bleed slowly, and let it alone a long time, the Man will be more hurt by his custome of Bleeding, than he will receive good by Evacuation of what is redundant. And in this first Rule Hippocrates seems to treat of Bleeding fast. But what follows, But in others you must not incrassate so much, but you must use a dry, white Medicine, such as Galls and Alum, may be understood of both Bleedings. For in both cases, whether, I say, it bleed slow or fast, when it is caused by a corrupt and thin blood, it is good to use things that thicken, and make slow the motion of the blood. And because besides these things it is necessary to make application of things that stop, we must reckon, that Hippocrates in these last words understood local Medicines; in the former, things to be taken by the mouth. Therefore, he says, you must incrassate drily, that is, use Medicines and Meats that dry and thicken: And there are two sorts of things that doe this, one by thickness of parts and astringion, as Pap made of Starch and Lentils, Syrup of Myrtles, &c. others make slow the motion of the blood without thickness and astringion, by giving it a certain thickness by accident, by cooling, or by cooling and drying; the first we use for slow Bleeding, the latter for sudden: For in Bleeding fast, it is too long to tarry for relief from eating Starch or Pears: But then drinking of cold Water, or a Decoction of Cinquefoil, which I use very cold, may do good. Yet the taking of thick and astringent things does by little and little thicken the blood, and so may doe good in slow Bleeding. But the use of such things seems hurtfull, because it either causes obstructions, or increases
